There is no problem of conservation more vital than that of preserving the fertility of the soil of our country. Those who dwell in cities are essentially as much interested in this task as are those who actually till the fields. The food of our nation must come largely from a well-preserved soil, and that soil necessarily must carry, either naturally or in the form of fertilizers, the proper nitrogen content. It has been said repeatedly that agriculture in its broadest sense has been neglected by the Federal Government in various ways. It is hoped that a genuine national policy of soil conservation and food production will be furthered at this time by taking such action relative to securing an adequate and economical supply of nitrogen as is recommended elsewhere in this report.

The outstanding war-time project which can be continued as a peace-time undertaking while at the same time retaining all its war-time functions for public safety is the Muscle Shoals project in Alabama. On account of the magnitude of this project not only in size but in importance to the whole nation, your committee has thought it well to report in a comprehensive way and at some length. For clarity of presentation the subject matter has been divided into eleven parts with frequent comment by the committee and with two very definite recommendations at the conclusion of the report.

II. WHAT WAS SEEN AT MUSCLE SHOALS.

(a) The Tennessee River at Muscle Shoals, from which power is to be taken to operate the nitrate plants and for other purposes, is as large, taken at the mean or average flow, as is the Ohio River at Cincinnati, Ohio, the Mississippi River at Dubuque, Iowa, or the Missouri River at Omaha, Nebr.

(b) The banks of the Tennessee River at Muscle Shoals are of such height that a hundred-foot head water may be held without building any retaining walls or dikes whatever except the dam proper.

(c) The pool formed by the dam will extend for a distance of 15 miles upstream, and the total amount of land flooded or damaged by the water is 9,000 acres. This area has been bought and paid for by the Government with a very few exceptions, where condemnation proceedings are now nearing completion. This land was secured at an average price of less than \$45 per acre.

(d) The Wilson Dam is about one-third completed and more than one-third paid for, as will be seen when the immense expenses attached to the preparatory work are considered, which expenses do not again have to be met in finishing the project.

(e) Two sections of the Wilson Dam—one at the north bank and one in the center of the river on an island—are partially completed. There yet remains for construction on these sections the discharge gates at the top and the roadway above the gates.

(f) The foundation is laid for a large portion of the rest of the dam and the protecting cofferdams have been removed.

(g) The excavations for the power plant and south section of the dam have been made under protection of an immense cofferdam which will permit work to be carried on in that section if the work is not too long delayed.

(h) A construction bridge carrying several railroad tracks, and supporting seven derricks, each capable of lifting 10 tons, has been built.

(i) Twenty-five miles of railroad track have been laid to haul supplies, rock, sand, cement, concrete, etc.

(j) Several locomotives, some of which weigh 65 tons each, have been used constantly in hauling material to the concrete mixers and thence to the dam.

(k) Three mixing plants with capacity to keep all the other equipment moving at full speed have been installed, one on the island near the center of the stream, one on the north shore, and one on the south shore.

(l) A large construction camp has been erected with individual homes for married men, bunk houses and mess buildings for single men, and administration offices and residences for the official corps.

(m) The Wilson Dam is 4,100 feet long; its base, which is sunk 12 to 15 feet into the solid rock of the river bed, is 160 feet wide; its height from the original river bed to the bottom of the overflow gates is 80 feet and to the roadway on the top 120 feet. This structure when completed will be the largest single piece of monolithic concrete construction in the world.

(n) Two locks for navigation purposes are being constructed at the north end of the dam, each one having a lift of 45 feet and with other dimensions adequate to accommodate the largest river craft.

(o) Nitrate plant No. 2 at Muscle Shoals stands to-day fully equipped and capable of producing 110,000 tons per annum of ammonium nitrate.

(p) The site on which this plant is built comprises approximately 2,000 acres.

(q) At the height of operations on this plant 20,000 workmen were employed. It was built in one year, and the first ammonium nitrate was produced one day less than a year from the time of starting construction work. At that time 90 per cent of the mammoth plant was finished, and to-day it is 100 per cent complete for the production of fixed nitrogen.

(r) The steam power plant was built so that nitrate plant No. 2 could begin production without waiting for the completion of the Wilson Dam, which was expected to take approximately three years. This steam plant produces nearly as much electrical energy as any other steam plant ever built, and contains one steam turbine unit with electrical generators which generate 60,000 kilowatts, or 80,000 horsepower, being one of the largest turbines ever constructed and operated. In addition there is place for a smaller unit which would be capable of producing 30,000 kilowatts, or 40,000 horsepower, making a total horsepower for the entire steam-power electric plant when completed of 120,000, which is ample to operate the electric furnaces in another part of the plant.

(s) The boiler room of this immense plant comprises a battery of 15 units, each rated at 15,000 horsepower. These boilers when running full capacity consume approximately 1,500 tons of coal each day, which fuel is dumped from the cars on overhead tracks into vast bins, and thence fed into the furnaces by automatic stokers without being touched by human hands since leaving the mine. The three stacks to provide draft for these furnaces vary in height from 275 feet to 300 feet and in diameter at the base from 23 feet to 26 feet.

(t) The kiln room, where the lime rock is burned to lime, contains seven cylindrical kilns which turn slowly and which are heated by a blast from finely ground coal. These kilns are of steel, lined with fire brick, and are so mounted that the lime rock when placed in the higher end will gradually travel the entire length of the kiln, which is 125 feet, and emerge from the lower end as burned lime. Approximately 1,500 tons of lime rock can be burned in a day, which shrinks in the form of burned lime to about one-half that weight.

(u) The electric furnace building where the burned lime and coke are fused electrically into carbide, as the first step toward fixing nitrogen, is about 1,000 feet long and contains 12 electric furnaces, each of which requires 10,000 horse power for its operation. Only 10 of these furnaces are expected to operate at any one time, leaving two for repairs at all times. The giant electrodes through which the electrical current passes and which furnish the heat for fusing the burned lime and the coke, are subjected to such terrific heat that they have to be renewed every three days. This shows the necessity for extra furnaces. Each furnace produces 50 tons of carbide per day, or a total for the 10 furnaces of 500 tons. Practically all work of handling the materials used in nitrate plant No. 2 is done by machinery. However, these electrical furnaces must be fed by hand in order to fill the blow holes that appear in the molten mass, which unless filled by shovelfuls of coke and lime, cause rapid radiation of heat.

(v) The plant where nitrogen is taken from the air by the liquid-air process is many times larger than any similar plant ever constructed. In this plant nitrogen testing 99.9 per cent pure is secured in volumes aggregating 500,000 cubic feet every hour. The oxygen and a small part of the nitrogen are returned to the atmosphere.

(w) The oven building contains 1,536 ovens in which the nitrogen is fixed, or caught, in the carbide. Each oven is about 3 feet in diameter and 5 feet deep, holding approximately 1,600 pounds of carbide. This charge is heated, electrically, to white heat and the nitrogen from another building is forced through it and is caught. The product from these kilns is cyanamid or lime nitrogen, and contains 21 per cent of fixed nitrogen.

(x) The autoclave building contains 56 cylindrical steel autoclaves, which are steam-tight vertical boilers with agitators to stir the powdered cyanamid in order to drive off the ammonia gas. Each autoclave holds four tons of the powered cyanamid and it takes about an hour and one-half to get the fixed nitrogen out of the cyanamid and

into the form of ammonia gas in order later to convert it into ammonium nitrate for military or agricultural purposes.

(y) Many smaller buildings, each of which is indispensable in the complete process through which lime, coke, and air must go in order to get nitrates for either explosives or fertilizers, are component parts of the gigantic whole of nitrate plant No. 2. In all there are about 30 buildings as units in this plant.

(z) Nitrate plant No. 1 is a much smaller plant than No. 2, and is designed to secure nitrogen from the air and fix it for military or agricultural uses by an entirely different process than the one used in No. 2. It has never operated on a commercial or practical scale but is completely equipped for operation.

COMMENT BY THE COMMITTEE.

The information given above contains some remarkable facts which your committee feels free to comment upon, not in the way of specific recommendations but rather that you may be informed what relation these facts bear to our welfare as citizens and as farmers.

(a) That the Wilson Dam contains the possibility of developing a hydroelectric plant far in excess of any yet contemplated in America with the exception of Niagara Falls is evidenced by the fact that it will maintain a head of water almost 100 feet high and has the volume of flow referred to in II (a), whereas the great Keokuk Dam across the Mississippi River holds only a 40-foot head of water.

(b) There seems to have been no graft in the Government's acquisition of the land which will be inundated. The average price paid for this land seems to your committee to be entirely within reason; furthermore, there appears no likelihood of litigation subsequent to such inundation.

(c) Millions of dollars, undoubtedly, have been spent in the preparatory work which necessarily had to precede actual construction. Now that all this preparatory work has been done and paid for, it is the thought of your committee that legislation and appropriations should be provided for in Congress to avoid the loss of all this preliminary construction.

(d) The engineers in charge of construction work on the Wilson Dam state that although only about one-third of the permanent work has been completed more than one-third of the total expense has been met, on account of the cost of the preparatory work.

(e) Your committee is impressed with the necessity for a resumption of building operations on the dam, which were discontinued in April on account of a lack of appropriations.

(f) It is needless to state that the great steam plant which is capable of running all of nitrate plant No. 2 was built only to operate the plant until the Wilson Dam could be completed and furnish a cheaper power. The steam plant should now be considered as an auxiliary power plant to the hydraulic development, as nitrates can be made much cheaper with hydraulic than with steam power.

(g) Your committee desires you to remember that in the fixation of atmospheric nitrogen in the lime-nitrogen process some substance must be made that will soak up nitrogen somewhat as a sponge does water. Carbide, which is made by fusing lime and coke in an electric furnace, is the material used in nitrate plant No. 2. However, it is a chemical reaction that takes place and not a physical one.

III. AVAILABILITY OF NITRATE PLANT NO. 2 FOR MANUFACTURING FERTILIZERS.

It is a generally recognized fact that up to a certain point the manufacturing of nitrate for military or for agricultural uses follows a common course. This is true whether the nitrates are atmospherically fixed or obtained otherwheres. In this report, of course, we are primarily concerned with the form of nitrates which is secured from the air, as the other forms have been longer used and more fully understood. There are three great sources of commercially used nitrates. First in tonnage is Chilean nitrate; then the ammonia secured as a by-product from coke ovens; and finally atmospheric nitrogen, which until recent years has been a dream of scientists but is now very practical, and is rapidly forging ahead in the tonnage produced. To these three may be added a fourth source, which is the use of legumes in fixing atmospheric nitrogen and which farmers are coming more and more to value. This is nature's way of taking fertilizer out of the air and placing it in the soil in tubercles on the roots of legumes. Man has recently learned how to do the same thing mechanically and chemically.

In the fixation of atmospheric nitrogen, either for military or agricultural purposes, several steps are necessary before we have a commercial product. In order that there may be a clear understanding of the process used in nitrate plant No. 2 at Muscle

Shoals, an effort will be made herewith to detail in nontechnical and comprehensible terms the various stages in the process.

1. Lime rock is burned into lime and mixed with dried coke which has been finely powdered.

2. This mixture is melted together in electric furnaces which generate a heat exceeding $1,500^{\circ}\text{C}$. The product of these furnaces is known as carbide, which is the same product that is used in all acetylene lighting plants.

3. The carbide after cooling is ground through various machines until most of it will pass through a screen having 200 meshes to the square inch.

4. Air being formed of a mixture of nitrogen and oxygen, and only the nitrogen being needed for this process, the two gases are separated, first, by compressing and cooling the air until it becomes liquid, then distilling this liquid to separate the two gases much in the same way that alcohol is separated from water in making spirituous liquors.

5. This nitrogen is then blown gently through ovens in which the powdered carbide has been heated electrically to a white heat, and the result is that the carbide catches or fixes the nitrogen in a manner very similar to the "soaking up" of water sprayed into a box of sand.

6. Now we have lime nitrogen (cyanamid), which is the first form of air-fixed nitrogen either for military or agricultural uses. It carries about 21 per cent fixed nitrogen, and is directly available as a fertilizer but has some limitations in its use.

7. The lime-nitrogen after being ground to a fine powder is treated to a bath of steam and a weak alkali, under pressure of about 150 pounds to the square inch. This causes a gas to be formed known as ammonia.

8. About half of this ammonia gas is mixed with air and by being passed through an electrically heated platinum gauze the gas-air is heated to 600°C . When this superheated mixture is suddenly subjected to a low temperature it begins to change to nitric acid, much as the moisture in a cloud condenses into rain drops when struck by a cooling wind. The cooling process is continued until all the ammonia is changed into a 50 per cent nitric acid.

9. The other half of the ammonia gas is then forced into tanks which hold the nitric acid and is absorbed by the acid. This gives us ammonium nitrate in liquid form. This process is comparable to the method of making carbonated water in which a gas is forced into the water and held there.

10. This liquid ammonium nitrate is subjected to heat, and evaporation removes all the liquid, leaving a pure ammonium nitrate which when cooled in revolving pans in which there are stirring paddles, gives us a grained powder not unlike sand in appearance and which carries 35 per cent of nitrogen. We all know that sorghum when subjected to the proper heat for too long a time crystallizes into sugar. A very similar crystallization process happens in the case of this liquid ammonium nitrate.

11. If sulphuric acid is substituted for nitric acid in the process described under paragraph 10, we will have ammonium sulphate instead of ammonium nitrate. Sulphuric acid is used in the production of ammonium sulphate can be purchased or made in the plant. When the Government plant at Nashville, Tenn., for the production of explosives was disposed of at the close of the war part of its equipment for the production of sulphuric acid was retained and shipped to Muscle Shoals and is now available for installation at nitrate plant No. 2 if it is found necessary to do so.

12. Either one of the above-named products is readily adaptable to fertilizer uses.

COMMENT OF THE COMMITTEE.

1. Your committee desires to suggest that in dealing with the whole proposition of manufacturing nitrates for military or agricultural uses the location of the plant is of prime importance. Nitrate plant No. 2 at Muscle Shoals, in connection with the Wilson Dam, has the following remarkable list of advantages in location:

(a) Practically inexhaustible quarries of the purest lime rock are easily accessible. The present quarries are only 28 miles removed.

(b) Coke, which, combined with burned lime, in the early stages of the process used at nitrate plant No. 2, is produced in large quantities in the coal fields of Tennessee and can be transported quickly to Muscle Shoals. The greatest coke-coal beds in the nation lie between the Tennessee and the Ohio Rivers.

(c) The greatest deposits of raw phosphate rock in America are in Tennessee, which adds the possibility of using phosphate rock in electric furnaces and producing phosphoric acid and available phosphates as well as nitrates.

(d) Coal beds of immense proportions almost surround Muscle Shoals, all within easy hauling distance. Great quantities of coal are needed to burn the lime rock, as well as to operate the great steam power plant as an auxiliary to the water power.

There seems to be no need of nitrate plant No. 2 producing its own coke, as this product can be purchased economically from coke ovens already operating. The same statement may be true relative to sulphuric acid in making ammonium sulphate.

(e) The Tennessee River is a navigable stream and so offers cheap transportation, both for supplies needed at the plant and for products shipped therefrom, to the whole Mississippi, Missouri, and Ohio River systems.

(f) Muscle Shoals is nearly in the heart of the great fertilizer using section of our nation, but is also situated agriculturally somewhat near the center of the whole country.

(g) Muscle Shoals is far enough inland to be considered in the safety zone for war time; that is, if an invading army should land on the Gulf shore, the distance to Muscle Shoals is so great that this plant would be comparatively safe, and could continue making nitrates to repulse the enemy.

(h) With the immense water power development incident to the completion of the Wilson Dam, there is a certainty that much of the electrical power can be sold for industrial uses other than operating nitrate plant No. 2. Within easy transmission distances of Muscle Shoals lie the metropolitan centers of Birmingham, Ala.; Memphis, Tenn.; and Chattanooga, Tenn., not to mention others of considerable importance. The great coal operations of this territory may be expected to become users of electric current too.

2. It will be permitted the committee to remark that the cheapness of any fertilizer depends to a very large extent upon the ease and simplicity with which it is manufactured, and that the more frequently it is handled or treated in the process of manufacturing the more expensive it becomes. Consequently, the cheapest fertilizer which is capable of being produced at Muscle Shoals is the lime-nitrogen (cyanamide). This product is a good nitrogenous fertilizer when used by itself, but carries much more nitrogen than the usual mixed fertilizer and must be used carefully. When only a nitrogenous fertilizer is needed, lime-nitrogen gives as good results as are secured by any other form of nitrogen, but is somewhat slower in its availability. However, in mixed fertilizers the lime-nitrogen, if used in too great quantities, causes the phosphates to become less soluble, and hence less available as plant food, on account of the lime reacting unfavorably on the phosphates. It is fair to state, though, that the chemists seem nearly to have a treatment for the lime-nitrogen which will remove this undesirable characteristic. It is entirely to be expected that with further experiment these difficulties will be entirely overcome.

When lime-nitrogen is advanced through its subsequent stages and is changed into ammonia gas, then to nitric acid, and finally into ammonium nitrate, or ammonium sulphate it can be readily used, either alone or in mixed fertilizers. All these later stages, as above stated, increase the cost of the nitrogen content of whatever product is manufactured.

3. In this report but little mention will be made of nitrate plant No. 1. The process designed to be used in that plant is entirely different from the one in No. 2 and although it is comparatively a simple chemical process the mechanical difficulties have been such as to offer great difficulties to a practical operation of the plant. Your committee desires the permission to suggest, however, that its faith in the ability of our chemists is so great as to justify us in holding nitrate plant No. 1 intact ready to operate when the difficulties shall have been overcome. Accordingly, you will note in one of the two definite recommendations at the end of this report that your committee has incorporated both nitrate plants in the same recommendation.

IV. NECESSITY FOR AN INCREASED NITROGEN SUPPLY.

The world's supply of nitrogen comes from two great classifications, the organic and the inorganic. The organic nitrogen is supplied by such commodities as tankage, dried blood, and cottonseed meal. These products are rapidly being transferred from the fertilizer field to the stock-feeding industry. It has developed that the feeder of live stock can compete in the purchase of these products much to the disadvantage of the feeder of soils who desires to use them as fertilizers. Their use as fertilizers is rapidly ceasing, but a constant increase is noted for these products as stock food. So we may as well not consider these organic nitrogenous products in summing up our available fertilizer supply. Their use is comparatively negligible as plant food.

Our inorganic nitrogen comes almost wholly from three sources. First in importance as measured by the tonnage used is the Chilean nitrates. Next in tonnage produced comes the coke ovens from which a form of nitrogen is secured as a by-product. In recent years, a third source has been developed in the fixation of atmospheric nitrogen. The development of methods, especially the lime-nitrogen or cyanamid process for fixing, or capturing, the nitrogen that is in the air, has assumed such importance in

recent years, not alone in our country but in several other nations, as to justify the statement that the world's increasing demand for nitrates in industry, for military purposes, and in agriculture will be met largely by the fixation of atmospheric nitrogen.

A review of the present situation as regards the Chilean nitrates and the by-products from the coke ovens will serve to confirm the statement just made. In the period between 1913 and 1920 the production of Chilean nitrates increased only about 28 per cent, although the whole world was seeking nitrogen. This may be accounted for, partly, by the falling off of the nitrate content in the Chilean product which requires the handling of a much larger tonnage of the raw material to satisfy the world needs. The available nitrogen in the Chilean product has dropped from nearly 30 per cent where it was in former years to less than 20 per cent now. This signifies, no doubt, that the best beds of the nitrate deposits have been used. Also, it may seem that inaccessibility of the remaining beds makes production much slower than was formerly the case. Whereas a laborer years ago was able to produce more than 70 tons per year, now the same laborer is producing approximately 55 tons.

The production of nitrogen as a by-product from coke ovens is altogether dependent upon the growth of the steel industry. Coke is produced primarily as an adjunct to the production of steel, and can not profitably be produced in quantities in excess of the requirements of the steel furnaces. In other words, it can not be produced simply for its by-products which are nitrogen, tar, gas, and oil. Somewhat more than half the coke of our country is produced in ovens which can save the by-products, but the old-fashioned bee-hive coke ovens are not being superseded although they produce nothing but the coke, and do not save the by-products. This may point to the conclusion that as more ovens are built, or old ones remodeled, the determining factor in their operation is the production of coke and not the by-products. So we should not expect the coke industry to lead out in nitrogenous production when its development is dependent upon the growth of another industry—steel. The increase in the production of nitrogen from these coke ovens in the period between 1913 and 1920 was slightly more than 19 per cent.

But the statistics as usually given representing ammonium sulphate production from the by-product coke ovens do not state the exact conditions from the fertilizer standpoint. To look at the statistics one might think that in 1918, for instance, there were produced 408,237 tons of ammonium sulphate available for use in agriculture. This is by no means the case, for this figure represents the amount of sulphate of ammonia that would have been produced in 1918 if all the ammonia in all forms that was obtained from the by-product ovens had been made into ammonium sulphate. The facts are that nearly half of this amount given as ammonium sulphate is never available for agriculture. In 1918 the actual production of ammonium sulphate was 218,194 tons, according to the United States Geological Survey report. As a general average, 45 per cent of the so-called ammonium sulphate represents simply the production of ammonia in gaseous form, which is absorbed in water and is sold as aqua-ammonia for refrigeration and other industrial and domestic purposes and is never made into ammonium sulphate at all. The demand for ammonia in this form is met first by the by-product coke ovens and what is left after these industries have been provided for is converted into ammonium sulphate and sold as a fertilizer ingredient. In other words, the ammonia product of the coke ovens seeks the refrigeration rather than the fertilizer market.

In opposition to the slow growth of nitrogen production in the Chilean nitrates and in coke ovens it is significant to note that for the years 1913 to 1920 the production of atmospherically fixed nitrogen enjoyed a growth of approximately 783 per cent. It is also worthy of note that the world took all this nitrogen and asked for more. We may confidently expect the use of nitrogen in fertilizers, in ammunition, and in industry to constantly expand. This expansion will be measured largely by the price of the nitrogen sold. If it can be manufactured and placed on the markets cheaply, and cease to be—as it now is—the determining factor in the price of all mixed fertilizers, we may look forward to a multiplied use of nitrogen. Farmers know that their operations are rapidly depleting our soil of nitrogen, and they willingly would replace this ingredient in the soil if it could be had reasonably. A reasonable estimate of the annual nitrogenous loss from our soils will be between three and four million tons, to balance which we had in 1920 a total world's production of nitrogen of only one and one-half million tons, not all of which was available for us, of course. To feed the world and to make at least a temporary profit in farming, we must continue to mine our soils until we can mine the air and take from it cheap nitrogen.

In view of the probable insufficient supplies of nitrogen from Chile and from the by-product coke ovens, it is somewhat alarming to know that our consumption of nitrogen is doubling every decade. Whether this increase can be maintained—and it can be accelerated under the most favorable conditions for producing and marketing cheap nitrogen—depends almost wholly upon the development of the air-fixation industry.

COMMENT BY THE COMMITTEE.

By way of suggesting conclusions, your committee calls attention to these pertinent facts:

- (a) That the world is running behind in the production of nitrogen.
- (b) That the price of Chilean nitrate is increasing as its supply becomes more inadequate.
- (c) That the United States alone paid in 1919, \$85,000,000 for Chilean nitrate.
- (d) That the United States has paid, including 1919, altogether for Chilean nitrate, plus freight, insurance, etc., approximately \$800,000,000.
- (e) That this vast expenditure justifies us in seeking other sources of nitrogen.
- (f) That nitrogen either by itself or in mixed fertilizers should be placed on the market at a valuation which is not so nearly prohibitory of its use.
- (g) That to secure a lessened valuation in nitrogen it must be taken from the air, where it is inexhaustible.
- (h) That since only about 55 per cent of our estimated total consumption would be produced by our own nitrogen plants of all descriptions, including Nitrate Plant No. 2, there is only a remote possibility of overproduction for the present decade.
- (i) That the by-product coke ovens are not to be considered as primarily producers of fertilizer ingredients, because, first, their production depends upon the steel industry; and, secondly, their products are sold as much as possible in the form of aqua-ammonia, and the remainder only as ammonium sulphate.

V. COSTS AND ESTIMATES.

(A) NITRATE PLANT NO. 1.

3 large buildings.....	\$7, 195, 496. 71
13 smaller buildings.....	2, 270, 413. 97

(C). THE WILSON DAM.

Various estimates have been offered as to the total cost of this dam, but as conditions relative to cost are changing so rapidly it is impossible to secure great accuracy. Two estimates are herewith submitted. The first one is based on conditions as they were in 1919 and is being held on that level in order to be definitely sure that the final cost can not exceed the figures given. The second estimate is based on conditions as they were in 1916, but there has been added in each item a 100 per cent increase in the hope that such an arbitrary increase will approximately represent the difference in the cost factors in the year 1916 and at the present time.

(A.)

Allotted for construction as per national defense act of 1916.....	\$13,160,000.00
Transferred from armament and fortification fund, June, 1920.....	4,000,000.00
Total allotments to date.....	17,160,000.00
Total approximate expenditures and commitments to date.....	16,650,000.00
Amount to be asked from Congress.....	10,000,000.00
Approximate total cost (based on 1919 conditions).....	50,000,000.00
Amount properly allotted to navigation purposes.....	4,500,000.00
Net cost for power purposes.....	45,500,000.00
Production cost, 1 horsepower per year (based on average horsepower 300,000, and a 10 per cent interest and operating expense).....	15.00

(B.)

General engineering and office expenses.....	2,275,000.00
Camps, general plant, railroad constructions.....	2,212,000.00
The dam proper.....	4,127,000.00
Locks.....	1,064,000.00
Substructure of power house and tailrace.....	2,000,000.00
Flowage damages.....	350,000.00
Road changes.....	30,000.00
Clearing.....	76,000.00
Head gates.....	135,000.00
Racks.....	68,000.00
Cranes.....	50,000.00
Generating equipment.....	4,200,000.00
Cables and wiring.....	150,000.00
Total.....	16,737,000.00
100 per cent increase.....	16,737,000.00
Total cost of dam.....	33,474,000.00
Amount properly allotted to navigation purposes and not useful for power.....	4,500,000.00
Cost of dams for power purposes.....	28,974,000.00
Production cost of 1 horsepower per year (based on average horsepower 300,000, and a 10 per cent interest and operating expense).....	9.66

NOTE.—One horsepower at Niagara Falls sells at \$17 per year.

(D) MANUFACTURING COST OF CALCIUM CYANAMID (LIME NITROGEN) AT UNITED STATES NITRATE PLANT NO. 2.

[Based on a two-weeks' run with steam power.]

Item.	Two weeks' test at approximately 20 per cent capacity, production 1,450 tons; cost per ton of lime-nitrogen.			Estimated cost of manufacture at 100 per cent capacity, production 222,200 tons per year.			
	Quantity per ton lime-nitrogen.	Unit cost.	Cost per ton of lime-nitrogen.	Quantity per year.	Unit cost.	Total yearly cost.	Cost per ton of lime-nitrogen.

Sand.....	1.50	.50	.75	1.50	.50	.75
Coke.....	.75	4.50	3.37	.75	4.50	3.37
Operating expenses: Electrodes, \$2.13; labor, \$4.45; power, \$44.01.....			50.59			50.59
Total cost per ton.....			60.11			76.95
Total cost per pound.....			.03+			.04-

NOTE.—When we assume power to cost \$0.00075 per kilowatt hour (\$0.0005925 per horsepower-hour) and use this cheaper hydroelectric power, the power item will stand at \$4.92 per horsepower-year instead of at \$25, as is used in the above table, which is approximately the commercial rate for power. This will reduce the operating expense for power as estimated above from \$44.01 to \$8.66 and give a total cost per ton for "mine run" of \$35.35 and for "washed" of \$41.60; or per pound of \$0.01767 and \$0.0208, respectively.

The estimates in the table given above are all based on a ton production of P₂O₅. To transfer these estimates into terms of 16 per cent acid phosphate it is necessary to remember that there are only 320 pounds of P₂O₅ in a ton of acid phosphate. By taking the pound costs in the table and multiplying them by 320 we ascertain the cost of 16 per cent acid phosphate, which will give us for the "mine run" \$9.60 and for the "washed" \$12.80. With power from the hydroelectric installation, these prices further reduce to \$5.65 and \$6.65, respectively, per ton of acid phosphate.

The figures in the above table and notes constitute what will doubtless be a very spectacular development relative to fertilizer prices.

(H) ESTIMATED SUPPLY AND CONSUMPTION OF NITROGEN FOR 1924 AND 1930, IN TONS OF PURE NITROGEN.

	1924	1930
Estimated peace-time consumption in—	<i>Tons.</i>	<i>Tons.</i>
Agriculture.....	172,000	285,000

Total.....		535.00	356.40	193.90	² 15.30

¹ Pounds of nitrogen fixed in the soil.

² Pounds of nitrogen taken from the soil.

NOTE.—The sum of columns 4 and 5 when compared to column 3 gives the amount of nitrogen fixed in the soil, or taken from the soil in growing the plant. It seems that not all clover and cowpea fields enrich the soil by chemical action. No figures are available in this connection relative to alfalfa. The average yield per acre of alfalfa hay in the United States for 1920 was 2.74 tons. This hay analyzes 2.3 per cent of nitrogen, which gives us 0.063 ton of nitrogen, or 126 pounds in each ton of alfalfa hay. How much of this is drawn from the air and how much from the soil has not yet been definitely determined. The average yield per acre of red clover hay in the United States for 1920 was 1.45 tons. This hay analyzes 2 per cent of nitrogen, which gives us 0.029 ton of nitrogen, or 58 pounds in each ton of red clover hay. It would seem, from the above table that many red clover fields are drawing upon the nitrogen reserves of the soil instead of adding thereto.

(J) WATER POWER AT MUSCLE SHOALS.

[Based on flowage records of 19 years.]

Horsepower in stream.	Months available.	Horsepower used and wasted with--					
		4-power units.		10-power units.		18-power units.	
		Used.	Wasted.	Used.	Wasted.	Used.	Wasted.

VI. THE REPORT OF THE NITROGEN PRODUCTS COMMITTEE OF THE MINISTRY OF MUNITIONS OF WAR OF THE BRITISH GOVERNMENT.

The greatest contribution to the literature relating to the fixation of atmospheric nitrogen that is now available is the report of the committee of eminent Englishmen. 24 in number, who were appointed in June, 1916, to investigate fully all the scientific and industrial problems incident to the creation of a nitrogen-fixing industry in the Empire. This report contains 360 large pages, and is the result of months of painstaking work on the part of the committee. The final report of this committee was made in May, 1919.

It will be of decided value in our study of the Muscle Shoals project to know what conclusions were reached by the nitrogen products committee. Consequently, space in this report is being taken for several quotations from the English document.

"(A) A large addition to the home output of ammonium sulphate coupled with the increasing competition of synthetic nitrogen products would undoubtedly cause a reduction in its market price, and this would be of advantage to agriculture and to the export trade.

"(B) It appears probable that undertakings of this character would have to receive the support of the Government or be carried out entirely as national projects.

"(C) The main characteristics of the cyanamid process are:

"(a) The relatively small power requirements per unit fixed as contrasted to the arc process.

"(b) The direct production of a solid nitrogenous fertilizer (lime nitrogen), thus avoiding the costs incurred in all the other established synthetic processes for converting liquid products into a solid marketable form.

"(c) The production of a cheaper marketable form of combined nitrogen than is obtainable by any other fixation process.

"(d) Its great adaptability as regards the products obtainable.

"(D) There seems no reason why manufacture both of carbide and also of calcium cyanamid (lime-nitrogen), if laid out on a large scale, should not be successful in this country. There are blocks of undeveloped water power in Scotland of sufficient size for the operation of a large factory.

"(E) The market price of a metric ton of combined nitrogen in the United Kingdom prior to the war varied from 66 pounds to 67 pounds (in the form of ammonium sulphate and Chile nitrate, respectively.)

"(F) The synthetic processes can produce a metric ton of combined nitrogen at a cost at the factory of from 20 pounds to 30 pounds.

"(G) The synthetic processes can produce a metric ton of concentrated (93 to 96 per cent) nitric acid for about half the cost of the Chile nitrate retort process.

"(H) The synthetic processes can produce a metric ton of combined nitrogen ready for the fertilizer market, as cyanamid or ammonium sulphate, at a cost at the factory of about or even less than one-half the pre-war market price of combined nitrogen in the United Kingdom.

"(I) A large proportion of the synthetic plant would find an application under peace conditions for the manufacture of nitrogenous fertilizers, either for home consumption or for exportation.

"(J) As compared with the retort process (used in connection with the Chile nitrate) the saving in the running costs over a period of two years would probably cover the initial capital outlay.

"(K) Dealing broadly with the postwar demand, the requirements of agriculture are certain to be much larger than formerly, the imperative need for maintaining and extending the world's production of food, and the vital importance of combined nitrogen for this purpose, having emerged as the salient lessons of the later stages of the war.

"(L) The consumption of combined nitrogen practically doubled in the 10 years before the war. When account is taken of the relative areas under cultivation in the food producing countries of the world, of the pre-war consumption of nitrogenous fertilizers in the most progressive of the agriculture countries, and of the corresponding consumption in the remaining countries, it is abundantly clear that the quantities of nitrogenous manures employed were in many cases below the most advantageous or profitable level. The difficulties experienced during the war period in obtaining supplies already provided a salutary lesson as to the importance of fertilization, and the resulting wider recognition of the value of fertilizers will lead to an increase in the demand for nitrogenous manures in countries where the consumption has hitherto been very small in proportion to the area under cultivation. In the opinion of the committee, the provision of a really cheap supply of fixed nitrogen would lead to a greatly extended consumption of nitrogenous fertilizer.

"(M) There will be also an increased industrial demand for fixed nitrogen. Nevertheless, the total requirements for industry are unlikely to amount to more than a relatively small proportion of the demand for agriculture.

"(N) It is evident that the supremacy of the Chile nitrate industry is already being challenged, and the near future holds out the prospect that ammonium sulphate of synthetic nitrogen products may become the dominant factor in the nitrogen market and govern the price of nitrate instead of following it as hitherto.

"(O) The proved utility of Chile nitrate as a fertilizer, however, is such as to insure its position in agriculture for a long time to come, but the extent of the demand under postwar conditions will be largely determined by the price at which the product can be marketed.

"(P) Other things being equal, however, the preponderating factor in determining the future consumption of combined nitrogen in agriculture will be the price at which

it is procurable. The possibilities in this direction due to the development of the synthetic nitrogen industry have already been indicated, and in the event of adequate supplies of fixed nitrogen being forthcoming at a price showing even a moderate reduction upon the pre-war figure, the committee is strongly of the opinion that there will be a very substantial increase in the consumption. If, however, the price of nitrogen remains at the level of the present controlled price of ammonium sulphate, the demand is likely to be largely determined by factors such as the prices obtainable for agriculture produce.

"(Q) The committee is satisfied that synthetic processes can at the present time be operated in the United Kingdom upon a sound economic basis and that the undoubted advantages enjoyed by such methods will become more pronounced in the course of time as the result of constant efforts toward improvement.

"(R) The committee is emphatically of the opinion that the national interests demand the establishment forthwith of nitrogen fixation and allied processes upon a considerable manufacturing scale.

"(S) It appears that the question of overproduction which was raised in evidence given before the committee, is hardly likely to constitute a serious factor in the post-war situation.

"(T) A minimum of perhaps 70 per cent of the world's total supplies of nitrate and ammonia nitrogen was utilized in agriculture prior to the war.

"(U) Combined nitrogen (as cyanamid or ammonium sulphate) can be obtained by synthetic processes at a cost, at the factory, which is less than half the market price of combined nitrogen from other sources, pre-war conditions being taken as the basis in each case.

"(V) The world's demand for combined nitrogen appears to double every 10 years. The increased production during the war has not been more than the normal rate of increase during peace."

"(W) As far as the United Kingdom is concerned, nitrogen fixation and allied processes will constitute a new 'key' industry. The committee is of the opinion that the initiation and development of the industry will require the active support of the Government."

COMMENT BY THE COMMITTEE.

1. As an aid in the study of the foregoing quotations, it may be well at this point to explain that there are three processes which are used commercially in the fixation of atmospheric nitrogen. Whether or not one or another of these processes enjoys any particular advantages over the others depends altogether upon several factors that enter into the manufacturing of fixed nitrogen. From a practical and agricultural point of view the cost of the operation, and the consequent market price of the commodity, is always the determining factor, so far as the availability for farming uses is concerned. Then again, the power required necessarily enters into the consideration. That process which requires least power, other things being equal, will naturally be the most favored method of fixing nitrogen. Also the proximity of the plant to its sources of raw material, and their availability, will assuredly reflect themselves in the ultimate price.

The three processes referred to frequently by the nitrogen products committee are the arc, the Haber (pronounced Haber), and the cyanamid or lime-nitrogen.

The arc process enjoys the distinction of being simple in that it uses the electric arc to force a combination of nitrogen and oxygen, which combination is caught in water, and after treatment in an alkali produces, as a primary product, nitric acid. Air and water constitute the main raw materials in this process. The handicap of the arc process is that it requires such an expenditure of electrical power. Not more than 4 per cent of the electrical energy used is represented in the nitrogen secured. This makes the arc process almost indefensible except where water power to generate the electrical energy is superabundant. Norway is the only country to use this process commercially, which may be accounted for by a study of her immense water power resources.

The Haber process is used mainly in Germany and was her principal reliance for nitrogen during the war. This process is based on securing a highly precise mixture of hydrogen and nitrogen, under great pressure and while subjected to terrific heat. If the mixture of these gases is properly maintained the heat and the pressure are easily controlled and the resulting product of fixed nitrogen is secured. But, however, if too much of one gas is admitted or too little of the other, the chemical reaction is highly dangerous in that an explosion occurs. A war incident may be cited in which the American war planes were bombing a German plant of the Haber variety, and although none of the bombs hit the mark the plant was destroyed on account of the workmen fleeing for safety from the bombs and so leaving the gases uncontrolled for

half an hour. The principal advantage of this process over any other known process is the small amount of electrical energy required. Approximately only one-fourth the energy is used in this process that is consumed in the lime-nitrogen method, and only about one-sixteenth as much as the arc process demands. Nitrate plant No. 1 was built to use the Haber process but has never produced fixed nitrogen commercially. The committee desires to suggest, though, that if the Germans can do it, so can we; and to suggest further that the difficulties encountered in the successful application of the well-known chemical laws concerned in this process, are mostly of a mechanical nature, now, and we may confidently expect such difficulties to be overcome by the ingenuity of our chemists and mechanics working together.

The cyanamid or lime-nitrogen process has been explained at some length in a preceding division of this report. Suffice it to say that this process, all things considered, is meeting with the most favor all over the world, and is the one used in nitrate plant No. 2.

2. The report of the nitrogen products committee of the British Government accentuates the following conclusions which have been arrived at in this country relative to a development of the nitrogen-fixing industry:

(a) That such an industry would have the effect of reducing prices on the nitrogen content of fertilizers.

(b) That such an industry would have the controlling influence in the determination of market quotations on fertilizers.

(c) That such an industry should receive the support of the Government.

(d) That such an industry, at least with our present knowledge of other processes, should be based on the cyanamide, or lime-nitrogen process.

(e) That the synthetic processes (arc, Haber, cyanamide) may reasonably be expected to produce combined nitrogen at approximately one-half the pre-war price.

(f) That the establishment of such an industry, although expensive, might be expected to amortize the original capital cost in a few years by the saving effected in market prices on nitrogen.

(g) That agriculture will use nitrogenous fertilizers in proportions which increase or decrease as the price of nitrogen fluctuates.

(h) That agriculture is the biggest user of nitrogen and therefore is primarily concerned in its production at a price which will permit of its use.

(i) That the Chilean nitrate industry will continue as a factor in the fertilizer market indefinitely, but that we should place ourselves in position to be independent of foreign supplies, both in times of peace and war.

(j) That a plant to manufacture fixed nitrogen can be operated on an economically sound basis.

(k) That the nitrogen industry is not of concern only to one group—as the military, the industrial, the agricultural—nor is it of interest to merely one section of our country. But it is a national problem which challenges the interest of all citizens who have regard for public safety in time of war or who desire that soil conservation and food production be safeguarded in order that agriculture and industry may prosper.

(l) That there is slight danger of an overproduction of nitrogen so long as the price factor is held constant and equitable.

VII. POWER.

Enough information has been offered in other portions of this report to show that any plant designed for the fixation of atmospheric nitrogen, which is to be placed on the competitive markets, must have readily and steadily available the cheapest form of power. In war times when low cost of operation was not of prime importance, provided a higher cost expedited our activities, it was possible to contemplate the operation of such plants as nitrate plant No. 2 with power which did not qualify as being the least costly. Accordingly, a giant steam plant was installed to run the plant during the interim between the completion of No. 2 and of the Wilson Dam, it being known that the power from the dam could not be available for perhaps three years after the plant began production. Nitrogen production by steam power is, of course, more costly than by water power, which is true of any other industry that can be hydroelectricified.

In peace times the successful and economical operation of nitrate plant No. 2 for the production of fertilizers depends almost wholly upon the completion of the hydroelectric plant in connection with the Wilson Dam. The whole proposition at Muscle Shoals revolves around the item of cheap power. Without this cheap power it is hardly possible to hope that the production of nitrogen will be secured at a figure low enough to materially affect the market price of fertilizers. All estimates, data, and reports from every country point significantly to hydroelectric power as being the

determining factor in the manufacturing of atmospheric nitrogen. All other competitive factors, such as the supply of raw materials, their location with regard to the plant, the available market for the product, the chemical and mechanical difficulties, all take places of secondary importance when compared with the one indispensable factor, cheap power.

That there will be an abundance of water power at Muscle Shoals upon the completion of the Wilson Dam is evident when the salient facts connected therewith are considered. The dam, being 100 feet high, will maintain a normal head of 95 feet. The dam and power house are being constructed for the ultimate installation of 18 generating units, each consisting of a water turbine and generator capable of producing 30,000 or 36,000 horsepower. Seventeen of these units are expected to be ready for operation at all times, leaving one out for repairs. These 17 operating units will therefore, have a total normal output of about 600,000 horsepower. The installation plans call for the immediate placing of only four of these units, which will be ample to operate nitrate plant No. 2, as they will produce 120,000 horsepower. It is worthy of note that the installation of only four units will allow much water to flow over the top of the dam unused during most of the year, whereas if 10 units were installed they could operate to full capacity on an average of half the time, which would justify their installation.

These statements are based on the known flow of the Tennessee River at Muscle Shoals during the period from 1895 to 1914 inclusive, with only one year not considered on account of incompleteness in the records. In all that time, 19 years, the lowest the river ever dropped would have produced 85,000 horsepower; but only 6 years of the 19 recorded show a flow at any time so small as to drop below the 108,000 horsepower required to operate nitrate plant No. 2. In these six years the time in which the flow was less than sufficient to produce this required horsepower amounted to 1.3 per cent of the total time. In these times of low flow the steam plant stands ready as auxiliary power, but to keep the power constant for the four units required to operate No. 2 the steam plant would have to be fired up only 1 day out of 60, on an average.

The records of flowage at Muscle Shoals show that for 9 months in the year there will be approximately 240,000 horsepower, for 7 months in the year 360,000 horsepower, for 5½ months in the year, 480,000 horsepower, and for 4 months in the year 600,000 horsepower, making an average of 300,000 horsepower for the whole year.

If we decide to install only the first four power units and be satisfied to make no use of the remaining power we must be content to see much water spill over the dam. If, however, we desire to harness the full force of the stream we will advocate the placing of the entire battery of 18 power units even if it can not be used throughout all the year. These considerations have given rise to descriptive terms to define the amounts of power available at Muscle Shoals. All that power (approximately 100,000 horsepower) which can be depended upon from day to day, year in and out, as the average lowest power available, is known as primarily horsepower. If for one day, or even for one week, as an extraordinary occurrence, the river should drop below this average lowest power line no recognition is given such occurrence in this definition. All other waterpower at Muscle Shoals, from the minimum of 100,000 horsepower to a maximum of 600,000 horsepower, is called secondary power.

As a maximum waterpower development at Muscle Shoals with 18 power units installed we have: 100,000 primary horsepower plus 500,000 secondary horsepower. It needs to be remembered that the primary power does not vary—it is constant—but the secondary power is quite variable.

There is a third power available at Muscle Shoals from the steam plant. This classifies neither as primary nor secondary power but should be considered altogether as auxiliary power. Its use should be to supplement the secondary power as occasion requires.

The immense reserves of secondary power available at Muscle Shoals not to mention the primary power which is just about ample to operate No. 2 constantly, brings to our attention the necessity of finding a suitable market for such excess power. It may not reasonably be expected that such a market will develop instantly. The history of great hydro-electric plants has been that at first there has been an excess of power for the available market; but that soon the demand for power exceeded the capacity of the plants. So it will undoubtedly be at Muscle Shoals. It would be foolhardy in the extreme, no doubt, to expect at once handsome dividends on our governmental investment at Muscle Shoals other than that which comes to all citizens from a satisfactory supply of nitrogenous products.

It would be unfair though, to estimate the cost per horsepower of the Wilson Dam on any other basis other than one that contemplates the eventual use of all power classified above. Undoubtedly, either by direct location of factories or by transmission, all the power that the dam is capable of producing will be utilized. Therefore

taking the total estimated cost of the dam with its power equipment but without the navigation features (which will be found in detail in another division of this report) and dividing by the maximum power developed we have the following: \$45,500,000 divided by 600,000 equals \$75, cost of installing each horsepower if all power were used constantly.

Inasmuch, however, as the primary and secondary power do not stand at that high figure all the time, but maintain a mean average of about 300,000-horsepower, the following equation more nearly represents a fair estimate of installation costs per horsepower. \$45,500,000 divided by 300,000 equals \$150, cost of installing each horsepower, based on average power developed. It will be seen that the initial capital cost of one horsepower at Muscle Shoals compares favorably with the same power when bought in the form of a high grade gasoline engine for use about the barn or in the shop. It is only fair to state, however, that other estimates as to the cost of the dam, exclusive of navigation features, and which are from dependable sources, reduce the figures above used by fully \$15,000,000. The estimate here used was made in 1919 at peak prices and is being adhered to as the highest possible cost of the dam.

Moreover, the cost of operation, per horsepower, after the installation is paid for is far less than that of any other kind of plant, not excepting the most economical steam plant. In this connection the great saving in coal that would be brought about should not be overlooked.

COMMENT BY THE COMMITTEE.

Recognizing that the power development at Muscle Shoals as represented by the Wilson Dam equals in importance, though not in expense, the building of nitrate plant No. 2, and fully realizing that No. 2 will be greatly handicapped until the dam is completed; and considering that the dam will meet its first justification for the expense of building it in the operation of No. 2, your committee, therefore, desires most candidly to state its thoughts on the correlation that exists between the two undertakings:

(a) First of all, it is desirable that the Muscle Shoals project pay a reasonable return on a reasonable capitalization.

(b) Next in importance, no doubt, is the necessity for operating No. 2 by power from the Wilson Dam.

(c) Provision should be made for installing at least the major part of the power units so that excess power would be available.

(d) If the complete installation of power units is placed then it might be well to suggest that the excess power be disposed of commercially but that in any event the necessities of the nitrate plants for power be met fully before such excess power is sold.

(e) There will be enough excess power, however, to return a handsome revenue to the Government.

(f) It must not be forgotten that the combined expenditures at Muscle Shoals in the Wilson Dam and nitrate plant No. 2 represent a citizens' investment made for us by our Government. This investment will be of value to all citizens, and consequently, all citizens should desire that the entire project be put on a business basis. The effort should be to make this gigantic undertaking of our Government "pay out." It can only be done by a businesslike administration of its affairs as will be explained in a later division of this report.

VIII. POSSIBILITIES.

In our consideration of nitrate plant No. 2 thus far in this report attention has been focused almost exclusively upon its capacity to produce nitrogenous fertilizers, as lime nitrogen, ammonium nitrate, and ammonium sulphate. In fact, the plant was built as a nitrogen-fixation establishment so that nitric acid and nitrates could be available for the manufacture of military explosives and for use in fertilizers. That in the erection of this great plant Congress had in mind its dual purpose—military and agricultural—is shown by the following quotation from section 124 of H. R. 12766 of the Sixty-fourth Congress:

"The President of the United States is hereby authorized and empowered to make, or cause to be made, such investigation as in his judgment is necessary to determine the best, cheapest, and most available means for the production of nitrates and other products for munitions of war and useful in the manufacture of fertilizers and other useful products by water power or any other power as is in his judgment the best and cheapest to use; and is also hereby authorized and empowered to designate for the exclusive use of the United States, if in his judgment such means is best and cheapest, such site or sites, upon any navigable or nonnavigable river or rivers or upon the public lands, as in his opinion will be necessary for carrying out the purposes of this

act; and is further authorized to construct, maintain, and operate, at or on any site or sites so designated, dams, locks, improvements to navigation, power houses, and other plants and equipment or other means than water power as in his judgment is the best and cheapest, necessary or convenient for the generation of electrical or other power and for the production of nitrates or other products needed for munitions of war and useful in the manufacture of fertilizers and other useful products."

(A) AMMONIUM PHOSPHATE.

A great development that can be hoped for at nitrate plant No. 2, is the obtaining of available phosphoric compounds from phosphate rock by treating it in the electrical furnace. It will be remembered that limestone and coke are fused into carbide by means of intense heat in the electric furnaces, and this fusion constitutes the first step in the fixation of atmospheric nitrogen. Later steps produced lime nitrogen, and from it is produced ammonia gas. A gas is of no value as a fertilizer as it can not be placed in the soil; it must be absorbed in some liquid to make it available, and later reduced to a solid form of a crystalline nature. In No. 2 this ammonia gas is absorbed either in nitric acid to produce ammonium nitrate, or in sulphuric acid to produce ammonium sulphate. In fact there are several acids that will absorb this ammonia gas. To cite only one more, it may be stated that hydrochloric acid can be used to form ammonium chloride, which is good for fertilizer use. In nitrate plant No. 2, if we desire to go beyond the lime nitrogen or cyanamid product—which is of itself a good fertilizer but with limitations—and produce the usual fertilizer commodities which are generally used, we have to reduce our lime nitrogen to a gas, ammonia, and use that as the base of our further developments. This ammonia gas contains practically all the nitrogen that the lime nitrogen carried, but it, in its turn, has to have its nitrogen fixed or caught as above stated, in liquid form first, through the use of an acid, and then solidified by boiling.

It is, as above set forth, largely immaterial to this ammonia gas which acid is used to absorb or catch it. Heretofore in this report slight consideration has been given any fertilizer question except the purely nitrogenous one. If, however, other acids can be produced in No. 2 which will absorb this ammonia gas, and if these other acids of themselves have fertilizing values, then it will be well to make such slight changes and additions in the equipment as will enable us to produce more than one fertilizer constituent.

By using the same electric furnaces that have been previously described, and by filling them with phosphate rock, coke, and sand instead of lime rock and coke it is possible to produce a very pure form of phosphoric acid which carries 45 per cent of available phosphates. Here again we see the desirability of the location of No. 2 as some of our largest phosphate beds lie in Tennessee not far from Muscle Shoals. This plan has never been tried out in No. 2, and in fact some alterations would need to be made in the equipment; but there has been a six months' test made of this process by the United States Department of Agriculture on a commercial scale. The result of this test, financially, was that on account of high-priced electric power the product of the test cost more than producing acid phosphate by the old and wasteful method of treating the raw phosphate rock to a bath of sulphuric acid. The conclusion, however, seems to be that with hydroelectric power as cheaply as it can be had at Muscle Shoals the process of making phosphoric acid is entirely feasible and practicable.

In the usual way which is now followed in the production of acid phosphate great use is made of sulphuric acid which has no fertilizing value whatever but really has an acidulous effect on the soil. This is also true of the use of sulphuric acid in No. 2 as an absorbent for the ammonia gas to make ammonium sulphate. In both instances we are carrying something along, sulphuric acid, which has no fertilizing value.

A substitution of phosphoric acid which carries a very necessary fertilizer ingredient for the other acids above mentioned, as the absorbent for the ammonia gas, would result in giving us ammonium phosphate, a fertilizer carrying two very valuable soil foods—nitrogen and phosphate. This ammonium phosphate differs from the ammonium nitrate and ammonium sulphate previously described as products of No. 2, in that it carries two fertilizers in one compound instead of one fertilizer in two compounds.

(B) POTASSIUM PHOSPHATE.

It will be seen from the foregoing paragraphs that at Muscle Shoals we have assuredly a plant to produce nitrogen, and also we have the same plant available as a possible producer of phosphate. This gives us two of the three ingredients that usually go to make up the mixed fertilizers which are sold to-day.

In close proximity to the plant at Muscle Shoals there lie great beds of potash shales, many of which contain 4 per cent of potash. It has been experimentally ascertained

that the substitution of these potash shales for the sand which is used in the production of phosphoric acid in the electric furnaces does not materially interfere with the chemical reaction that produces phosphoric acid, but does produce at the same time a fusion or union of the potash in the shale with the phosphoric acid. This gives us potassium phosphate with phosphoric acid carrying the potash.

The production of phosphoric acid in making potassium phosphate is in excess of the amount needed to absorb the potash and can be united with ammonia, giving ammonium phosphate.

It will be seen, therefore, that in the one plant there is a great possibility for the development of a complete fertilizer output by absorbing the ammonia gas of the lime-nitrogen process and the potash from the shales in phosphoric acid which is of itself a carrier of fertilizer values and then crystallizing the compounds by the application of heat, much like sugar is secured from the juice of the beet.

(C) OXYGEN.

In one of the buildings at nitrate plant No. 2, the air is separated into two component gases, nitrogen and oxygen. The nitrogen is used in making lime nitrogen but the oxygen is released and returns to the atmosphere. Inasmuch as this gas is used extensively in factories and shops for welding and similar uses, eventually we may expect that it will be retained and disposed of commercially.

COMMENT BY THE COMMITTEE.

Although the making of phosphate and potash fertilizers at nitrate plant No. 2 are herein classified as possibilities, it must be conceded by all that not much remains to be done in an experimental way as most, if not all, the chemical problems have been solved. Their classification as possibilities rather than actualities is accounted for by the fact that No. 2 was built to make lime nitrogen and other forms of nitrogenous products and certain additions to the equipment and perhaps some new construction would be necessary if other fertilizers were made. Whether or not such expenditures will be approved remains in doubt.

Farmers should realize, though, that the plant is abundantly justified if it produces nothing more than nitrogenous products.

That there may be a clearer understanding of the importance of the entire Muscle Shoals project, and especially that the significance of its phosphate development may be fully realized, your committee submits herewith some quotations from an article written in July, 1919, by Doctor Caro, who is recognized in Germany as the leading authority on nitrogen fixation. Doctor Caro was minister of war munitions for Germany at one time.

"Far more dangerous (to the German nitrogen industry) than the competition of Chilean nitrate appears to be the possibility of competition with artificially fixed nitrogenous fertilizers produced in foreign countries.

"The largest of these foreign lime-nitrogen plants is located in the United States in Alabama. Its situation is most excellent. It is connected with the ocean by means of the Tennessee River, which has been made navigable. It is situated at a source of almost constant water power, amounting to 400,000 horsepower, and is right in the midst of a locality where all the raw materials of the lime nitrogen (cyanamid) industry are present in the highest purity and at the very lowest prices.

"Near by are the inexhaustible deposits of high per cent phosphate rock. The possibility, therefore, exists of producing cheaply ammonium phosphate containing roughly 45 per cent of water soluble phosphoric acid and 20 per cent nitrogen.

"To be sure, the United States is in a position to use right there the nitrogen thus produced, amounting to about 130,000 tons per year; nevertheless it will be possible to ship it long distances to places where its phosphoric acid content will be of importance, and hence it will be sure to offer very strong competition to the German fixed nitrogen industry."

IX. CONSERVATION.

Nitrate plant No. 1, nitrate plant No. 2, and the Wilson Dam together constitute what is probably the greatest single conservation activity of our Government. This entire project should be viewed in the same light as is an irrigation project, a forest reclamation activity, or a levee and drainage problem. Its great purpose in peace times is to assist in maintaining our soil fertility, and consequently in the adequate production of food for our increasing millions.

As all other conservation projects are of general interest to all the citizens so is this undertaking at Muscle Shoals. Farmers and military men need not assume to

themselves all the benefits accruing from an operation of this project. In times of war it will be predominately military in type; in times of peace it will be almost wholly agricultural in character. But at all times it will be of service to all our people to protect and to feed.

When the rapid depletion of our soil resources, especially the nitrogen content, is considered we can not view with complacency the ultimate condition toward which we are advancing agriculturally. An average crop of corn takes from the soil about 3,000,000,000 pounds of nitrogen. A cotton crop of 15,000,000 bales depletes the soil to the extent of one-half billion pounds of nitrogen. Other crops take lesser amounts, but the grand total will not fall below 6,000,000,000 pounds. Of course the alchemy of nature is working all the time in slowly replacing this lost nitrogen, but the process is wholly inadequate to keep pace with the requirements of our growing crops.

Man is doing a great deal to replace what his crops take from the soil in the form of nitrogen by growing legumes, by spreading manures, and by using fertilizers. But his efforts do not more than half restore the nitrogen that the soil loses yearly. More nitrogenous fertilizers at a cheaper price would assist wonderfully in checking this soil depletion.

COMMENT BY THE COMMITTEE.

In 1920 the average yield of red clover hay was, for the whole Nation, 1.46 tons per acre. This hay carried enough nitrogen to yield 0.029 tons per acre, or 58 pounds. If enough of this clover had been turned under by the plow so that all the nitrogen would have been given to the soil, it would have taken approximately 4,000,000 acres to equal the annual output of nitrate plant No. 2. Since, however, the sacrifice of all this clover hay, at the price secured on an average for such a product would represent a soil fertility investment of approximately \$60,000,000, it can be seen how significant our soil conservation problems are becoming.

X. RECOMMENDATIONS.

In consideration of all the foregoing information, after personally inspecting nitrate plant No. 1, nitrate plant No. 2, the Wilson Dam, the flood area above the dam, and the construction equipment; after advising with engineers and chemists on the site of the project; and after submitting the items of costs and estimates herein contained to other engineers and chemists of national reputation, your committee unanimously makes two specific recommendations, as follows:

- (a) That the Wilson Dam be completed by the Government without undue delay.
- (b) That since the Government now has the rights, under contract, to produce nitrates by air-fixation processes, the nitrate plants No. 1 and No. 2 shall be placed under the direction of a governmentally owned corporation, which may, at its discretion, operate the plants or maintain them ready for operation, but with strict regulations relative to prices to be secured for commodities in which products of these plants are used.

COMMENT BY THE COMMITTEE.

In connection with the recommendations above set out your committee offer this additional information:

(A) RELATIVE TO RECOMMENDATION.

- (a) That the work on the Wilson Dam is now only sufficient for maintenance.
- (b) That such maintenance, or stand-by expense, is too great to be long continued.
- (c) That work can not be resumed on the Wilson Dam until Congress makes the necessary appropriation, which will be approximately \$10,000,000.
- (d) That the completion of the Wilson Dam is indispensable to a successful and economical operation of the nitrate plants.
- (e) That since the Federal Government has invested millions of dollars at Muscle Shoals, it is nothing but good business to complete the investment by finishing the Wilson Dam so that the entire undertaking may begin to return service to the people and interest to the Treasury.
- (f) That if work is too long suspended on the Wilson Dam, much of the temporary preparations for construction will not then be available but will have to be again performed.

(B) RELATIVE TO RECOMMENDATION.

(a) That nitrate plants No. 1 and No. 2 can be operated by the Federal Government as the lessee of patent rights covering the processes used. There is herewith submitted a quotation from the contract which has been signed by the firm owning the patents and the Federal Government:

"The licensor (the firm owning the patent rights) hereby gives and grants to the licensee (the Federal Government) in addition for use and applications exclusively by the licensee in the operation of the aforesaid plants, the rights, license, and privilege to use any and all of the patents, processes, methods and designs embraced in the license hereinbefore granted to the licensee by article 1 hereof, from and after the 1st day of June, 1921, or the date upon which the United States shall cease to be in the present war (whichever date shall last occur) and until the expiration of the United States patents covering the same, upon the following terms, to wit."

(b) That the Federal Government must pay a royalty to the firms owning the patent rights on the processes for every pound of nitrogen content that is manufactured in the plants until the patents expire, which will be in most instances in 1931. Continuing the above quotation:

"The licensee shall pay monthly to the licensor for such additional license under this article a royalty, unless and until changed by the arbitration hereinafter provided of 1½ cents per pound of nitrogen content in any and all products manufactured by the licensee at each and every of said plants under and by the use of any of the patents, processes, methods, or designs embraced in the said additional license."

(Then follows provision for arbitration of royalty fees if either party to the contract is dissatisfied.)

(c) That the nitrate plants can not be leased by the Federal Government to any private firm, unless indeed it be the ones that own the patents on the processes used.

"The licensor for use and application exclusively by the United States Government or the aforesaid agent (the representative of the Ordnance Department who signed the contract for the Government) at such plants, has given, granted, assigned and does hereby give, grant, and assign to the licensee the right, license, and privilege to use any and all the processes, methods and designs covered by letters patent of the United States and involved in the manufacture of lime nitrogen (calcium cyanamid), its conversion to ammonia gas and the oxidation of the ammonia to weak nitric acid, etc."

(d) That, therefore, your committee could see only three alternatives relative to the disposition of the plants, as follows:

(1) To lease them for operation; which leasing, under the contract, would necessarily be to the firms owning the patent rights, and would give us, as a primary conclusion, that no appreciable lowering of fertilizer prices would ensue.

(2) To keep the plants intact on a yearly stand-by, or maintenance, expense which would be great, ready to produce nitrogen in the event of another war, but suffering all the time an unavoidable deterioration of the present equipment and of its adaptability to the development of new processes, which might reasonably be expected to render us helpless, so far as nitrogen fixation is concerned, in comparatively a few years.

(3) To operate the plants under some sort of governmental machinery which would guarantee a businesslike administration of their affairs.

(e) That your committee chose the third method outlined above and wishes at this point to outline briefly its ideas as to the administration of the plants.

Your committee thinks it is a universal conclusion that such establishments should not be dependent upon annual appropriations from Congress but that they should be thoroughly equipped, supplied with the necessary operating capital in the shape of a loan or otherwise, and then directed by a board which should be left free to operate the plants on a business basis.

This board should be the legal head of a corporation, the stock of which is all held by the Treasury of the United States. The members of the board should represent various occupations of our people but each member should be a person of proven business ability. It is preferred by your committee that the members of the board be appointed by the President of the United States similar to the appointment of other Federal boards and commissions. After their appointment, the members of this board should be left free, except with such limitations as are legally necessary, to direct the affairs of the entire Muscle Shoals project as a corporate entity.

The powers of this corporation for which this board acts should be, in the opinion of your committee, generally as follows:

(a) To own and operate the entire Muscle Shoals project.

(b) To sell to the United States, to producers, and to others the products manufactured.

(c) To regulate the prices obtained for any mixtures in which products of these plants are used.

(d) To purchase, lease, or acquire patents, both domestic and foreign, of improved processes.

(e) To operate the entire proposition as a business corporation, charging prices sufficient to pay a reasonable dividend on a reasonably estimated capital cost.

(f) That your committee does not consider the Muscle Shoals undertaking as it now stands as predominately either an engineering or a chemical problem, as those tasks have largely been performed. It is now, rather, a business problem which is of concern to the people in all parts of the nation.

(g) That your committee does not at all favor selling the entire Muscle Shoals project, as has been done with other great war munition plants, some of which cost approximately as much as Muscle Shoals and were sacrificed, on time sales, at prices representing about 5 per cent of their construction costs.

(h) That after the Government has operated these plants for some time and has acquired, by purchase or otherwise, patent rights on the processes used therein, and has demonstrated fully that the research and practical features justify a continuance of their operation, the matter of leasing or selling them to farmers or others for continued operation would then be of pressing importance, as such leasing or selling could be conducted on a competitive basis which is now impossible, since the Government is only the licensee of patent rights that are owned by others.

XI. CONCLUSION.

It is hoped that the presentation of the information herein contained will serve to confirm you in the thought that the action of the American Farm Bureau Federation in months past relative to the Muscle Shoals project has been a correct action and should be continued with the guidance of the two recommendations above made.

There is an imperative demand at this time for the initiation of legislation in Congress which will make it possible to complete the Wilson Dam and to operate the nitrate plants. It is urgently requested that you signify your approval of the recommendations of the committee in order that the president of the American Farm Bureau Federation, the legislative director, and the legislative committee may feel authorized to proceed.

Respectfully submitted.

W. G. JAMISON,

President Colorado Farm Bureau Federation.

JOHN G. BROWN,

President Indiana Federation of Farmers' Associations.

CHESTER H. GRAY,

President Missouri Farm Bureau Federation.

WASHINGTON, D. C., May 31, 1921.

The CHAIRMAN. In a general way, Mr. Silver, what was the conclusion of this committee?

Mr. SILVER. The conclusion of the committee, just to give it to you from recollection, if you don't care to read it—

The CHAIRMAN. I would like to have you summarize it—

Mr. SILVER. They did very earnestly urge that this matter be completed, and without delay.

Senator CAPPER. You will find two short paragraphs on page 33 of the report, in large type.

The CHAIRMAN. What I am trying to get at is, I want to see if this Farm Bureau Federation changed its mind. Did it?

Mr. SILVER. No.

The CHAIRMAN. They did not recommend in this report, did they, after they investigated that, Ford's offer to be accepted?

Mr. SILVER. No. The Ford offer had not been made then.

The CHAIRMAN. No; I understand. In a general way, did they not recommend that the Government retain it and go ahead and itself manufacture the nitrates?

Mr. SILVER. The committee recommended that the plant be completed, and we did what we could to urge upon the Members of Congress the importance to agriculture of the completion of the dam and operation of the plant, keeping in mind not only the fertilizer end for the farmer but—

The CHAIRMAN. At the time this report was made, Mr. Silver, nitrate plant No. 2 was completed in every detail. The only thing left uncompleted was the dam, which

is still uncompleted, and is in the same condition now that it was in when this report was made.

Mr. SILVER. Yes. But it is well known to the committee and to the farmers that the steam operation of this plant, wholly steam, is not an economical thing.

The CHAIRMAN. Oh, yes; but you are saying that they recommended that the plant be completed. The plant was completed.

Mr. SILVER. May I read the recommendations here?

"(a) That the Wilson Dam be completed by the Government without undue delay.

"(b) That since the Government now has the rights, under contract, to produce nitrates by air-fixation processes, the nitrate plants, No. 1 and No. 2, shall be placed under the direction of a governmentally-owned corporation, which may, at its discretion, operate the plants or maintain them ready for operation, but with strict regulations relative to prices to be secured from commodities in which products of these plants are used."

That was the specific recommendation.

The CHAIRMAN. Now, I will take that. That is a recommendation that in effect, I think, is carried out in the introduction of the bill which is now before this committee, as I drew that. That recommendation is a recommendation that Congress pass the kind of a bill that I have introduced; but now this same farm federation does not want to pass that kind of bill, but wants to accept Ford's offer. Is not that it? If that is not it, let us get it in a nutshell.

Mr. SILVER. All right. You have largely stated the situation. At the time of this report there was no alternative.

The CHAIRMAN. I understand that.

Mr. SILVER. And, broadly, the farmers believe that the Government should not function where the individual can. They thought they might have to to get this great plant in operation, but when the opportunity presented itself for operation by private capital they embraced that opportunity.

The CHAIRMAN. I am not objecting to their changing. I want to get the truth in the record. That is all I care for. Is it not true that this committee that was appointed by the Farm Bureau went down there and looked it all over and made a very thorough investigation and came back and recommended at that time action similar to that contained in the bill that I have introduced, and that is pending now before this very committee?

Mr. SILVER. That is their specific recommendation.

The CHAIRMAN. That carries it out exactly. I could not do it in better terms than that. Since that time, however, Mr Ford has made his offer, and the Farm Bureau has stated that they want Ford's offer accepted, so they prefer the Ford offer to the method outlined in the bill, I take it, and to that extent they do not ask for the carrying out of the recommendations made in the first report?

Mr. SILVER. They ask for the completion of the dam and the action of Congress necessary to make this a going concern under private operation as a first choice and the Atlanta resolution reserves the alternative. They ask to accomplish the same purpose they originally asked for.

The CHAIRMAN. No; they don't. They asked for Government operation.

Mr. SILVER. They ask now for a different instrumentality, but they ask you to accomplish the same purpose.

The CHAIRMAN. Oh, yes; they ask for fertilizer, the same thing when you get through.

Mr. SILVER. And it makes a threefold request; improvement of navigation, water-power development, and fertilizer production. It is threefold.

Senator NORBECK. May I ask, do you believe that when they acted on the Ford recommendation they had a full understanding of what Ford had offered to do?

Mr. SILVER. When they acted on the Ford resolution there had been, some time before, copies of the Ford tender sent to all our State federations and others of our active people—that is, I mean it was not limited to the offices in the 46 States, but in addition to the Federation itself, there were other copies sent out. I don't know just how many. It was sent out in order that they might have the opportunity to study it. After having studied the proposal I would say here, as I said before the House committee, there was some language that they wanted changed. On the House side the changes were accepted, and I have come here with the belief that the tender has been reprinted to carry the amendments asked for or the qualifying language, so that we start with that premise, that the things that we had in mind that we did ask for are carried in that reprint, and the tender to-day is in the form approved by our people.

Senator NORBECK. Let me go back a little, if you please. When this original report was made, about a year ago, and they recommended that the Government go ahead

and manufacture the nitrates, were they aware at that time that we had a contract outstanding whereby we agreed to pay a royalty on the nitrate production?

Mr. SILVER. Yes. That was one of the reasons, because they thought that we could, by research, find a process of our own.

The CHAIRMAN. Yes. They say in this report, as I remember it, that there were rights that the Government had, that the Government could manufacture it, but they could not transfer it to private parties; that if they sold it to private parties they would not be able to use the patents.

Senator NORBECK. The Government was under the same contract, was it not?

The CHAIRMAN. Yes.

Mr. SILVER. If the plant was leased they could not lease the process, but if sold could authorize the use. That is treated in the report.

Senator NORBECK. Did they find at that time, or is it their conclusion, that fertilizers could be produced cheaper at Muscle Shoals than the market would afford otherwise?

Mr. SILVER. Yes. That is their report and belief.

Senator NORBECK. Even operated as a Government institution?

Mr. SILVER. And that has been testified to before the committees of Congress, either this or some other committee, by different ones, and at different times.

Senator NORBECK. You understand that the engineers who have appeared before us have invariably said that it can not be produced at the market price, even with cheap water power, do you?

Mr. SILVER. I am going to ask, when we come to the fertilizer end, you hear Mr. Bower, who will treat with the fertilizer end of it and will give you that information.

Senator NORBECK. Who is Mr. Bower?

Mr. SILVER. He is my assistant, sitting right here at my elbow. He will go into the fertilizer end in a way that I can not, and he will treat that particular phase that is in your mind in a way that I think will be satisfactory to you.

Senator NORBECK. As I understand it, the farmers do favor turning over to Mr. Ford property that cost seventy, eighty, or ninety million dollars, also a hundred year monopoly on the use of the water power, and in addition to that 4 per cent money furnished by the Government, all of which could be capitalized at the outset for possibly \$50,000,000. They turn that \$50,000,000 over to Mr. Ford on his promise that he will put an indefinite amount of additional money into it, and that he will make fertilizers, if he can make 8 per cent profit, and that he believes he will be able to reduce the price of fertilizers. Is that the situation?

Mr. SILVER. That would be one way of stating it.

Senator NORBECK. Well, is it correct, or is it wrong?

Mr. SILVER. I would not state it quite that way, but take them one at a time. Mr. Ford does agree to make fertilizers, and he does feel as others do and state that he can make cheaper fertilizers, and if you give him the opportunity and somebody else makes them cheaper, the purpose of making cheaper fertilizers has been accomplished. Again, when you talk about the Government extending credit, 4 per cent money, as though that were a special favor, the record of Governmental securities does not show that 4 per cent is cheap money as shown by this list.

Bonds.	Amount issued.	Amount retired.	Amount outstanding.
2 per cent consols of 1930.....	\$646,250,150	\$46,526,100	\$599,724,050
4 per cent loan of 1925.....	162,315,400	43,825,500	118,489,900
2 per cent Panamas of 1916-1936.....	54,631,980	5,677,800	48,954,180
2 per cent Panamas of 1918-1938.....	30,000,000	4,052,600	25,947,400
3 per cent Panamas of 1961.....	50,000,000		50,000,000
3 per cent conversion bonds of 1946-1947.....	28,984,500		28,984,500
2½ per cent postal savings bonds, first to twenty-first series.....	11,774,020		11,774,020

Senator NORBECK. Could a private party finance a dam undertaking like that at less than 7 per cent, counting the allowance for the cost of raising the money, or would it take them 10 per cent?

Mr. SILVER. Senator, you have put your finger on one of the points that is nearest our hearts, namely, that 80 per cent—I could answer that now, but would rather do so later.

Senator NORBECK. If you prefer to answer it later, that is satisfactory to me.

Mr. SILVER. I will come to that later in my statement.

Senator NORBECK. I just wanted to be sure that you answered it. My opinion is that the public have no more understanding of Mr. Ford's offer than these Senators did, and I say to you that this committee and the committee of Congressmen that visited Muscle Shoals went down there and looked the thing over and came back, and we found that we had never understood Mr. Ford's offer.

Mr. SILVER. That is possible. But the thing we want to do is to arrive at the right conclusion.

If I may, I will follow along, but do not hesitate, at any time that I am not making myself understood, to interrogate me.

Having called your attention to the different interests the farmer has in it, namely, improvement of navigation, further power development and fertilizer production, the farmer is endeavoring to eliminate the arbitrary methods and practices which special interests employ to keep prices high. Such arbitrary conditions are excessive or unnecessary tariffs, trade practices, patent rights, formulas, etc., such as in the production of nitrates there is a tariff asked on the product ammonium sulphate that we hope to be able to produce here cheaper than anybody is producing it in or out of the country.

The CHAIRMAN. What is that?

Mr. SILVER. The nitrate, in whatever form it may be worked out. There is a tariff provision on both sulphate of ammonia and potash, just a possibility, maybe, but at any rate it makes a high cost factor.

The CHAIRMAN. Are the people whom you represent opposed to a tariff on potash?

Mr. SILVER. Yes. We filed a brief to that effect.

The CHAIRMAN. With the Finance Committee?

Mr. SILVER. Yes.

The CHAIRMAN. You realize that even after we get the nitrates we have to have potash in order to make fertilizer?

Mr. SILVER. Oh, yes.

The CHAIRMAN. Nitrate is only one of three important ingredients.

Mr. SILVER. Only one of three important ingredients, yes. The duty on potash is 2½ cents per pound, which very materially increases the price to the farmers in producing their crops.

I will read this:

"Muriate of potash containing 50 per cent K_2O is selling for \$35 per ton landed in coast ports. This duty would add \$25 per ton to this price at importing cities, to which would be added the profits of mixers, dealers, freights, etc."

That is not only a profit on the goods, but it is also the profit on the tariff, and that affects the price.

The CHAIRMAN. As I understand it, that potash comes from Chile that you are speaking of?

Mr. SILVER. No; this is from Germany and France.

The CHAIRMAN. Oh, yes. It is the nitrate that comes from Chile. The potash is from Germany and from France?

Mr. SILVER. Yes; it may be either.

The CHAIRMAN. Two and one-half cents a pound would mean \$30 a ton, would it not?

Mr. SILVER. It is 50 per cent.

The CHAIRMAN. It would be \$50 a ton.

Mr. SILVER. No; it would be \$25 per ton.

Mr. BOWER. It is 2½ cents a pound on K_2O . Muriate of potash carries 50 per cent K_2O , and the duty is imposed on the potash content.

Mr. SILVER. This duty will cost the farmer from \$12,000,000 to \$15,000,000, of which the domestic producers of potash will only benefit to the extent of \$2,000,000.

The CHAIRMAN. It seems to me it would be interesting right there to know what Mr. Ford was thinking about in the potash line, what effect, if we pass that tariff bill, it will have on his offer?

Mr. SILVER. I am using this as an illustration, just to show you how the high-cost factors affect the farmer, and as I go through my testimony I will try to show you how we can benefit by less-cost factors, and I am using that as an illustration, and it is an illustration you are all familiar with and are acting upon at this time.

The CHAIRMAN. I think it is very pertinent, but the point I want to get at is that while it would not affect Mr. Ford in his getting his nitrates out of the air, it is the completed fertilizer that the farmer is interested in, and he says he expects to produce the fertilizer at such and such a price. If his potash, which constitutes about one-third of the fertilizer, is increased about \$25 a ton, it may be that it would completely nullify his proposition.

Mr. SILVER. It would apply to all alike. It would make fertilizer high, but it would not change Mr. Ford's relation as compared with other fertilizer people.

The CHAIRMAN. It is not in writing, of course, but his representatives say to us, "We are going to cut the price of fertilizer that the farmer has to pay in half." Now, won't this tariff alone prevent him from doing that?

Mr. SILVER. We are protesting against the passage of that paragraph of the tariff bill. Of course we have no way of knowing what Congress, in its wisdom, may see fit to do, nor can Mr. Ford control it.

The CHAIRMAN. I realize that, but the point I want to make is would not that of itself make Mr. Ford's proposition an impossibility?

Mr. SILVER. No; it would not affect Mr. Ford's proposition, because he would have the same relation. I am talking for the farmer. I am not talking for Mr. Ford.

The CHAIRMAN. Exactly; and so am I. But it seems to me you forget the farmer when you say it would not affect his proposition, because his proposition is that they are going to cut the price of fertilizer to the farmer in two in the middle. You say it would not make any difference, because everybody else's price would go up, but that is not quite it. That is not cutting it quite in the middle, at least. It is \$50 a ton now, and he is going to make it for \$25, and he is going to pay \$25 a ton right there.

Senator NORBECK. Go out to the sand hills of Nebraska and manufacture it.

The CHAIRMAN. He can not get it for that price out there, unfortunately. I wish he could, but he can not.

Senator KEYES. I can not understand why you bring it in here as a tariff matter unless it does apply to Muscle Shoals. We are discussing the Muscle Shoals proposition.

Mr. SILVER. I was simply using that as an illustration. When you get to the tariff you get different angles on it. I did not bring it in here as a tariff measure, but simply as an illustration of how the farmer suffered from high-cost factors, and what benefits they get from low-cost factors. I did not intend to provoke a tariff discussion at all.

Senator HEFLIN. The chairman asked him the question.

The CHAIRMAN. It seems to me it has a direct bearing.

Senator HARRELD. If this tariff increases the price of potash, it would increase that price to all manufacturers alike, so relatively it is the same thing.

The CHAIRMAN. That is what he says, but I want to have you or anybody else explain it, because Ford says he is going to cut the present price of fertilizer in two in the middle, and that is what the farmer is interested in. I would like to have anybody show me how it is going to be done if we are going to pay a \$25 tariff.

Senator NORBECK. I call your attention to the fact again that he has not given any bond that it will be cut in two.

The CHAIRMAN. The people advocating Mr. Ford's offer are taking his word for it. Senator HEFLIN. And some of us haven't any notion of voting for the tariff on potash.

The CHAIRMAN. I have not for one, I will say. I have not any notion of voting for it; but I call your attention to the fact that it will be no relief to the farmer when Mr. Ford comes back and the farmer says, "You agreed to cut my fertilizer bill in two, and I was paying \$50 a ton, and I am paying \$50 a ton yet." Ford says: "That was because of the tariff on there, and it does not affect my proposition, because relatively it was just the same as it was before," which is true, but it has not helped the farmer.

Mr. SILVER. Of course you would still be producing cheaper nitrogen. You would still have the relief that you gain from carrying this 1 ton instead of 5 tons; you would save the cost of four freights; you would save there, although you have lost on the tariff on the potash. There would be economies still possible there. They would be partly offset by the tariff that may be put on potash; it does that much to neutralize the benefits hoped for by the people who are interested in cheap fertilizer.

Senator HARRELD. All of which illustrates the point I made the other day, that if Mr. Ford wants to get out of this fertilizer contract he would find a hundred loopholes to get out of it.

Senator HEFLIN. Not after the contract is drawn.

Senator HARRELD. Under that provision of the contract under which he would be relieved from acts over which he had no control.

Mr. SILVER. Of course, he would have no control over what Congress saw fit to do in the matter of tariff.

I refer briefly to the ammonium sulphate, the proposed duty of \$5 a ton, and then, second, the unfair freight rates. Freight rates are high, and to the farmer, compared with the selling price, they are unfair. The division of freight rates, long and short haul, discriminates against him, as was illustrated by some one, probably Senator Jones, who was telling before a committee the other day that the freight from Albuquerque, N. Mex., to Boston on their cotton is around \$1,500 a car, and on goods, the

same back; but from Los Angeles it is \$1,000 either way. Now, that is a discrimination against those people in that territory where those freights are so made; and that has to do with high-cost factors; not only that, but the fact that all freights are apparently high at this time.

Senator NORBECK. Let us get down to Muscle Shoals. The thing this committee would like to know is whether there is any prospect at Muscle Shoals of reducing the price of fertilizer 1 per cent. If there is we would like to know it.

Mr. SILVER. To my mind Muscle Shoals is not alone a question of Henry Ford's contract or fertilizer; it is the turning point of the development of our natural resources that might have to do with less cost factors.

Senator NORBECK. If it works a certain way?

Mr. SILVER. Yes.

The private selling agreement. To illustrate, the steel business, the Pittsburgh Trust case, where we have paid, under the pooling agreement, phantom freights to the extent annually of many millions of dollars, estimated before the Interstate Commerce Commission some seventy millions of dollars annually that is paid for service that is never rendered, but purely a phantom freight that they collect off of the producers because of their pooling agreement to make the Pittsburgh base. If you set up a new base, like it is possible, if you set up cheap electric power at Muscle Shoals for a new base, we do away with that base and save many millions of dollars in that way. Sixty thousand dollars of phantom freights were paid on the steel in the Federal Reserve Bank Building in Chicago.

The CHAIRMAN. Let us see. I agree with you that that phantom freight on steel is an outrage. I think it is an economic sin, and that almost any Government in the world besides ourselves would almost have a revolution brought about. I can not condemn it in parliamentary language that is strong enough; but you propose here, by starting in at Muscle Shoals, not that you will do away with that principle but that you will establish another base that won't be quite as bad as that, on the same principle, I suppose, that this is established. To get a practical statement of it, if I was shipping steel from Chicago to Omaha, I would have to pay freight, in addition, although the steel might have been manufactured in Chicago and never any part of it have been east of Chicago, but I would have to pay freight from Pittsburgh to Chicago, would I not?

Mr. SILVER. Yes, sir; that is right as to freights.

The CHAIRMAN. There is no principle of economics on which that can be defended. Muscle Shoals is not going to help that if it fixes another base down there. The principle will be just as bad if we establish another phantom freight rate from Birmingham, Ala., although there may not be quite as much money in it as there would be from Pittsburgh.

Senator NORBECK. It is not violent to assume that cheap power will bring the steel industry there. Is it not only one of the factors in the steel industry, and a very small one at that?

The CHAIRMAN. The point he is making here, in my judgment, has not anything to do with it, because the thing that is wrong about the freight business will be wrong even though the sin may not be quite as great. If he was here advocating Government ownership of railroads and a law abolishing that kind of discrimination, it would be perfectly applicable. What has happened, as a matter of fact, is that the Federal Trade Commission, that wanted to investigate that steel proposition, has an injunction against it now by the United States court prohibiting it from going into the practice of the steel companies in charging that extra freight rate. So we have a question of courts as well as railroads in it.

Senator HEFLIN. I suggest, Mr. Chairman, that we let him go along in his own way and state what he feels will bear upon it. It won't take him very long.

Mr. SILVER. The point in that is that under the production of steel by the electric furnace method certain grades can be produced at about half the cost of the coke-oven methods, if my information is correct, and if we set up the development on that basis others may get on a like basis to compete, and it will be a solution of that problem, once the steel people see fit to go into the field.

Senator NORBECK. I notice that the steel fellows instead of going to Niagara Falls, when that power development was in progress, went to other places. Did they know what they were doing?

Mr. SILVER. The development of electric power on the amortization basis, as provided here, has not been looked upon with favor by those who have been developing water powers, but if in the future it is made dependable by the Government authorizing it, there might be a different light in the location of their plants and securing of their power.

Senator NORBECK. But the fact remains that the amount of horsepower available in our water falls is quite limited and if you use it for steel you won't have it for washing machines. There are a great many different purposes for which it can be used.

Mr. SILVER. All the industries of the United States use some 31,000,000 horsepower, and all the railroads of the United States, if electrified to-day, would not use to exceed 14,000,000 horsepower, and we have some 70,000,000 potential horsepower, with less than 10,000,000 developed.

Senator NORBECK. Yes; but it is potential and not available horsepower.

Mr. SILVER. Well, but it can be made available.

Senator NORBECK. You make and transmit that horsepower from the Rocky Mountains to the Alleghenies and you won't have much of it left by the time you get to the end of the line.

Mr. SILVER. It is not all in the Rocky Mountains, though, Senator.

Senator NORBECK. No; but there is a hundred times more out there than you can use. That is where the large amount of it is. You would have to move that over to the industrial centers, or over on the railroads in New York, and your loss would be pretty heavy in transmission.

Mr. SILVER. Somebody's report says that if the Potomac River, right here near Washington, were locked and dammed there would be produced more water power than is produced at Niagara Falls. Here we see this going to waste every day without seeming to realize it.

The CHAIRMAN. We can not get anywhere with that. We tried that a great many times, to develop Great Falls out here, but have not been able to do it, because the special interests do not want it developed, and your organization has been unable to help us.

Senator HEFLIN. That comes back to what I said a while ago.

The CHAIRMAN. Even Ford was not bidding for that, so you can not lay that to the fellows who are after Ford's scalp.

Mr. SILVER. I am trying to illustrate the point that with the water powers in the West and particularly where the power is needed, in a great many instances, if it can be developed on the right plan, so as to be of use to the people in an economical way—

Senator NORBECK. Is it not a fact that the majority of the articles that are written on our power development give the maximum development always; that they include the secondary and third and fourth kind of horsepower, instead of limiting themselves to the power that runs throughout the year?

The CHAIRMAN. I think it is probably hardly fair to say that, but it is true that there is the load-factor proposition. In other words, 100,000 horsepower—

Senator NORBECK. Does not mean 100,000 horsepower. There is such a difference between theory and practical application.

The CHAIRMAN. It is not so much that, but you have always to have enough to reach the peak. There is lots of it you do not use. For instance, you do not use it all in the operation of a street railway. It is like operating a street car in Washington. There will be two hours in the morning and two hours in the evening when you would need all the power you had, and the balance of the day you would not need half of it, and still you would have to have the same amount of power there all the time. That is what they call the load factor. You can not utilize it for practical purposes clear up to the limit all the time.

Senator NORBECK. The testimony we have is that the streams of the United States vary so much with the season, that while at times the potential horsepower is very great, at other times it is very weak.

Mr. SILVER. There are many things that have to do with our high-cost factors, secret processes and formulas of different kinds. One of the cases I might mention would be the case of the Selden patent which set out to be a tax on every horsepower developed by internal combustion engines, but it was finally fought and fought to a successful conclusion and that tax was removed, or that cost factor was reduced.

The Gillette razor is another illustration of how under certain patents the high cost factors are maintained, for during the life of the patent on that it was a \$5 article, and since the expiration of the patent it is a 65-cent article. Now, all these methods are used to keep costs higher to the people, but if we can start any place to cheapen production we set in motion helpful influences that would have to do with less cost factors.

I use these three illustrations to show you that fertilizer is not the only thing that would be affected. There are other things than fertilizer, for if we make a cheaper cost factor of electricity, which is the most desirable power, and we have abundance of it in our water powers—if we develop them we can not only produce cheaper fertilizers and cheaper steel, but we can manufacture or can fabricate woodenware

cheaper, steel cheaper, and make our binders, tractors, trucks, etc., cheaper, and we can fabricate wool and cotton cheaper. Many of the things that enter into our everyday life can be made cheaper, if we make cheap raw material of electric current, and my group believes that Muscle Shoals is the place to try it out, to start this new kind of development of these great natural resources, and with one of the greatest manufacturers of all times.

Senator NORBECK. If we turn it over to a millionaire, how will we have anything to say about developing it afterwards?

Mr. SILVER. Under the plan that is proposed in this tender the public maintain their equity. You turn it over to him with conditions, and at the end of the lease period you still have it; it continues your property, and the public enjoy their equity as they go along because of these less cost factors. I am just illustrating the point that while that belongs to the public to-day, and rightly so, if you pledge the public credit, which I think we do too little of, use the public credit and save in the cost—80 per cent of the cost of electricity is interest—if you cut the rate of interest from 8 or 9 per cent to 4 per cent it would about cut in two the cost of the electricity, just that one point, and if you go on and amortize that and pay back in full and use that current for public purposes on the basis of maintenance and depreciation, you have served the public well, and they have maintained their equity and benefit in that natural resource.

The CHAIRMAN. Now, in this case of Mr. Ford's proposition that you are advocating, what is there in his offer that guarantees cheaper electricity, or any of those things? He has not agreed in his offer that he will sell a single kilowatt of that electricity.

Mr. SILVER. He does not need to sell a single kilowatt of electricity for the public to enjoy it, for they can enjoy it by cheaper manufactured articles, if he will produce the things that they need to buy and sell them on a lower basis, because he has lower cost factors, and the public will enjoy the benefit.

The CHAIRMAN. Exactly; but how do you know he is going to do that? Suppose he starts in in the steel production now and makes steel down there, self-binders and plows. His cost factor, because he has got 4 per cent Government money to develop that is entirely lost and he can make it cheaper than the International Harvester Co. makes it in Chicago. Has he, in his offer, anywhere, either directly or indirectly, agreed that he would let any governmental authority say that he ought not to charge too much to the farmer for a binder that he would make, and is there anywhere any guarantee in it that he will not only cut under the International Harvester Co. to enough to make the sale, but that instead of the people getting the benefit of that cheap cost factor, that cheap money that he is getting from the Government, and cheap electricity that he is getting, that he himself will get the benefit, or his corporation?

Mr. SILVER. The fact that he is the head of the corporation is sufficient guarantee that the corporation will have the viewpoint that the public is to enjoy it.

Senator NORBECK. What will we do when he is dead? He wants a hundred-year contract.

The CHAIRMAN. He has agreed that this shall be done by a corporation. He is about as old as I am now. He is not a baby or a child, and if you are going on faith, as you are, and as your own testimony shows, and you are basing it on his reputation for selling things cheap and good, as far as he is concerned, I agree with you most heartily.

Mr. SILVER. You agree with that?

The CHAIRMAN. Yes, sir. It will probably be 5 years before this is completed, and probably 10 years before that machinery is completed. By that time Mr. Ford will be ready to die. I can not expect to live more than 10 years, nor can Ford. We will both be dead. That corporation will be a corporation. How can you fix it otherwise? Tell me how you can fix it so that that corporation can have the soul left in it for the other 90 years of this lease that Ford has in him.

Mr. SILVER. Well, there are two things that arise in my mind when you ask that question. One of them is that his business has been successful, his goods have been produced at less and have been sold cheaper, and we are interested in that, and a corporation as successful as his has been would be slow to get away from that principle.

The CHAIRMAN. What is the difference between that corporation with Ford dead, and J. P. Morgan's Corporation, and what assurance have we that the International Harvester Co. in less than two years after Ford is dead won't own every dollar's worth of that stock. Where is the guaranty for that?

Mr. SILVER. I don't know that there is any guaranty in the way you picture it, but there is this guaranty, and, finishing what I meant to say about that, if that great business were begun on that plan it would likely continue it for no other than the selfish reason that it had been profitable. I think it would continue. And then the

other reason is that if you give to Mr. Ford on that basis this great water power you will have set a precedent, and you will have others doing the same thing, the International Harvester people and some other corporations. There will be other water powers. This is only one of fifty, using a figure of speech.

The CHAIRMAN. That argument applies to the International Harvester Co. and every trust corporation in business.

Mr. SILVER. In other words, their own business life would depend upon getting a development of a like kind, and in that way you would get all of them on a lower cost basis, and consequently a lower selling basis to the benefit of all the people.

The CHAIRMAN. All right. Now, suppose Ford does get this, and suppose he dies. He can not expect to live more than two or three years after this is completed, at the very best. He dies and this corporation is there and the International Harvester Co. buys the stock and owns the corporation; do you suppose that because they bought the stock that used to be owned by Ford, they will be moved by his proposition to do better by the farmer than they are doing now with that immense establishment? Is that going to make them good?

Mr. SILVER. No; not as you put it, but if you take as an illustration a water power at a capital cost of \$300 per horsepower developed, the cost of horsepower per year would be at the rate of 8 per cent; private development, \$24; operation and maintenance, say, \$6, making the horsepower cost, which is about the average east of the Rocky Mountains, \$30 per year. Now, if, on the question of pledging public credit and getting a less rate of interest, you use, say, 4 per cent on that same capital stock, and have a \$12 interest and \$6 operation and maintenance, you would have \$18 per horsepower year. But if at the completion of the amortization time, when you had no interest and you had your \$6 operation and maintenance, you would have your \$6 per horsepower per year.

Now, that will illustrate just how to step down in cost, and without any other thing than competition in business and a desire to do business, if they can have that much improvement in their cost, they are going to sell cheaper every time in the absence of pools and secret agreements and trade agreements like I referred to a while ago; and there is water power enough to give all the cheap electric plants that this country has need of for many, many years to come, if it were all put to use.

The CHAIRMAN. But everybody knows that the history of the past, if it repeats itself, will mean that there will be just as many combinations when water powers are built and constructed as there are now without water powers. If the International Harvester Co. is a trust, as we thought it was and as the Supreme Court held it was, without water power, would it be any the less a trust if it had water power and could get its power cheaper? Do you expect some magic to happen because we are going to furnish 4 per cent money for a corporation that a very good man is going to own the controlling interest in for a few years and then have it remain good throughout eternity?

Mr. SILVER. This is not a case of a good man or bad man. This is a case of developing the great natural resource on a better basis than is now used.

The CHAIRMAN. And turning them over to a corporation.

Mr. SILVER. No matter what corporation you turn it over to, good or bad or any other kind, it makes a less cost factor. In the development of water power it has been common and is common to put in as much stock and bonds and preferred stock and all other kinds of securities as they could, and as the earning power increased they continued issuing securities, built on up, and that makes a high-cost factor by the time it gets down to the consumer, and if you take out at least this one margin—that is the power factor—and put it on another basis, you certainly have helped the people to that extent.

Senator KENDRICK. Now, Mr. Silver, may I ask a question there? Do you think and believe that the cost of production that is involved in the manufacture of different articles to the farmers or industries has very much to do with the price of that article when it is delivered to the man who uses it? Don't you believe that in the majority of cases, stating the question in another way, there is but very little relationship in the cost to the producer of it, the manufacturer, and the cost to the consumer? Your argument is, in effect, if the Government cuts off a large part of the cost in its delivery of this plant to Mr. Ford it will cheapen the cost to the consumer. Is not that it?

Mr. SILVER. Yes.

Senator KENDRICK. Now, my question is, do you believe that, with the majority of manufacturing concerns, that has any bearing on the price?

Mr. SILVER. I grant you when business is going good and prices are easy, and everything is going up, that mostly business depends upon what the traffic will bear, just what they can sell it to the public for; but when less favorable times come, and it becomes a question of who does the business and who keeps going, there is no doubt about it, in the absence of pooling agreements and trust agreements, there is competi-

tion, and that the industry with the most favorable cost factors is certainly the one that gets the business, or the other meets the competition. They do come down, and if you cut the cost factors—and this is one of the principal ones in all industry—and put them on a less-cost basis, you make possible a less-cost factor of the manufactured or fabricated production to the farmer.

The CHAIRMAN. Now, Mr. Silver, suppose we developed Muscle Shoals according to the first recommendation of your committee after their extensive examination of things, where they advocated development by the Government owning all this property, and the Government retaining the property, following which recommendation I drew and introduced a bill which is now pending and which you and your fellows have now gone back on and changed your opinion in favor of Ford, but suppose we develop it according to your first recommendation, and this cheap power is developed down there by this corporation that I have provided in the bill, and we have the board I have outlined in the bill to safeguard the price, and we have this Government corporation selling the power to Ford or to Morgan or to Harriman or to anybody else, but we exercise the power to say, "We will sell you this power at a cheap price, and you can make steel out of it, but under the law authorizing us to do so we insist that the farmer shall get the benefit of this article when it is completed, and you can not sell it to him above a certain percentage of profit," would not that guarantee that the farmer is going to get the benefit, and through him the people of the United States, of whatever cheap power is developed here? On the other hand, with your proposition to turn it over to Ford on his proposition, and Ford dead, you haven't given us any assurance, and I challenge you to give any, if it is not in his contract, to fix up a contract that will guarantee that the consumer is going to get the benefit. You can't do it.

Senator HEFLIN. His contract does set out, or he offers to set out in the contract, that he will not make over 8 per cent.

The CHAIRMAN. On fertilizer. But there is not a damned thing in there but what he can make a thousand per cent on a plow or a harrow or an automobile or anything that he produces.

Senator HEFLIN. The fact is, Mr. Chairman, that he has made automobiles cheaper than anybody else.

The CHAIRMAN. I have said repeatedly if you will guarantee he will live a hundred years, I am ready to vote for his proposition now. I have faith in him, but I don't believe when he is in heaven he is going to run this corporation here on earth that has not any soul, and you can not, and nobody can, fix up a contract that can make it possible for that to be done. It can't be done. So you are advocating something here for the farmer that, when it comes to roost, although you may be dead, like me, when the time comes you will ride through on this popular move, but eventually it will come home to curse you because you have advocated such a thing, and it is going to bring condemnation, to my mind, on every man that has had anything to do with putting it through.

Mr. SILVER. I can not think or believe that by developing a natural resource on the basis that it does and will benefit the people, you will be in any way bringing a curse on anybody, but on the contrary, a blessing to many farmers in distress at this time.

The CHAIRMAN. No; you won't; but you have assumed again that this will benefit the people. You haven't any assurance that this corporation will benefit the people one iota, and you can not demonstrate it or show it, and that is where the curse comes in. It will be just like any other corporation. It will be owned by somebody else and will be manipulated just the same as the International Harvester Co. has been manipulated and is being manipulated right now, and the farmer will not be helped any.

Senator HEFLIN. They have not been able to eliminate Ford yet.

The CHAIRMAN. Ford is going to die. Who is going to guarantee that he is going to live.

Senator HEFLIN. He will live 15 or 20 years.

The CHAIRMAN. It will be 10 years before this thing is developed. I get tired of men advocating a thing that it seems to me they ought to see, must see, and do see, that this corporation that Ford is going to organize, with Ford controlling it, is not the corporation that is going to operate when Ford is dead. He is 60 years old now, in round numbers. It will be 10 years, at the very best, if this is accepted tomorrow—it will be 20 years before it will be in full operation down there.

Senator HEFLIN. I understand he is ready to go to work on it as soon as the Government accepts his offer. He works mighty fast when he undertakes anything.

The CHAIRMAN. I know he does. When he has 4 per cent money he can do it well when he gets at it.

We will take a recess until 2.30.

(At 1 o'clock p. m. a recess was taken until 2.30 o'clock p. m.)

AFTER RECESS.

The committee reconvened at 2.30 o'clock p. m.
The CHAIRMAN. You may proceed, Mr. Silver.

FURTHER STATEMENT OF MR. GRAY SILVER.

Mr. SILVER. I do not know just where we left off, Mr. Chairman, but I think on my memorandum here we had gotten down to the question of the opposition.

The opposition to this matter of developing Muscle Shoals: The National Fertilizer Association, the by-product coke oven interests, the American Cyanamid Co., and others have vigorously opposed this development and have issued propaganda far and wide, in and out of Congress, and they must feel that there is some force and effect in the belief that a great many have that it would result in cheaper methods or cheaper production, or they would not have that fear of that development. They would not be uneasy about an interference with their business as set up and conducted, which has made the farmer very unhappy and caused him to seek for some other method of securing these necessary plant-food ingredients, commonly called fertilizers.

I was going to offer for the record, Mr. Chairman, a list of the constituent members of the American Fertilizer Co., just to show the names of those who are vigorously opposing it, if we have that with us.

Mr. BOWER. We have not that here.

The CHAIRMAN. All right.

LIST OF MEMBERS OF NATIONAL FERTILIZER ASSOCIATION.

HONORARY MEMBERS.

George Braden, Louisville, Ky.
Gustav Jarecki, Cincinnati, Ohio.
William Prescott, Cleveland, Ohio.
J. Rice Smith, Augusta, Ga.
William T. Wuichet, Dayton, Ohio.

ACTIVE MEMBERS.

Acme Manufacturing Co., Wilmington, N. C.
Adair & McCarty Bros. (Inc.), A. D., Atlanta, Ga.
Alabama Chemical Co., Montgomery, Ala.
Alliance Fertilizer Co., Alliance, Ohio.
American Agricultural Chemical Co., New York City.
American Cotton Oil Co., The, New York City.
American Fertilizer Co., Savannah, Ga.
Anaconda Copper Mining Co., Chicago, Ill.
Anderson Phosphate & Oil Co., Anderson, S. C.
Apothecaries Hall Co., Waterbury, Conn.
Arkansas Fertilizer Co., Little Rock, Ark.
Armour Fertilizer Works, Chicago, Ill.
Baltimore Pulverizing Co., Baltimore, Md.
Batesburg Cotton Oil Co., Batesburg, S. C.
Baugh & Sons Co., Philadelphia, Pa.
Berkshire Fertilizer Co., Bridgeport, Conn.
Blackshear Manufacturing Co., Blackshear, Ga.
Blackstone Guano Co., Blackstone, Va.
California Fertilizer Works, San Francisco, Calif.
Calumet Fertilizer Co., New Albany, Ind.
Camp, William H. (Inc.), Petersburg, Va.
Canton Fertilizer Co., Canton, Ohio.
Capital Fertilizer Co., Montgomery, Ala.
Caraleigh Phosphate & Fertilizer Works, Raleigh, N. C.
Central Chemical Co., The, Hagerstown, Md.
Chamberlain & Barclay, Cranbury, N. J.
Chicago Feed & Fertilizer Co., Chicago, Ill.
Contentnea Guano Co., Wilson, N. C.
Cope & Daffin (Inc.), Savannah, Ga.
Cotton States Fertilizer Co., Macon, Ga.
Dunling & Co., Union Stock Yards, Chicago.

Dainippon Jinzo Hiryo Kaisha (Ltd.), Tokyo, Japan.
 Davison Chemical Co., Baltimore, Md.
 Diamond Fertilizer Co., The, Sandusky, Ohio.
 Dixie Guano Co. (Inc.), Suffolk, Va.
 Drovers' Packing Co., Kansas City, Kans.
 Empire Cotton Oil Co., Atlanta, Ga.
 Empire State Chemical Co., Athens, Ga.
 Etiwan Fertilizer Co., Charleston, S. C.
 Exchange Supply Co., Tampa, Fla.
 Farmers' Fertilizer Co., The, Columbus, Ohio.
 Farmers & Planters' Co., The, Salisbury, Md.
 Federal Chemical Co., Louisville, Ky.
 Georgia Fertilizer & Oil Co., Valdosta, Ga.
 Graselli Chemical Co., Cleveland, Ohio.
 Griffith & Boyd Co., Baltimore, Md.
 Groves Fertilizer Works, Cincinnati, Ohio.
 Gulf Fertilizer Co., Tampa, Fla.
 Gulfport Fertilizer Co., Gulfport, Miss.
 Gunns (Ltd.), Toronto, Ontario, Canada.
 Haffey & Co., Philadelphia, Pa.
 Hamm Co., The M., Washington Courthouse, Ohio.
 Hawaiian Fertilizer Co. (Ltd.), Honolulu, Hawaii.
 Higgins, A. W., Westfield, Mass.
 Home Fertilizer & Chemical Co., Baltimore, Md.
 Home Guano Co., Dothan, Ala.
 Hopkins Fertilizer Co., New Albany, Ind.
 Hubbard Fertilizer Co., Baltimore, Md.
 Huston, Darbee & Co., Seaford, Del.
 International Agricultural Corporation, New York City.
 Jackson Fertilizer Co., Jackson, Miss.
 Jarecki Chemical Co., Cincinnati, Ohio.
 Lebanon Fertilizer Works, Lebanon, Pa.
 Lowell Fertilizer Co., Boston, Mass.
 Macmurry Co., Charleston, S. C.
 Manning Oil Mill, Manning, S. C.
 Mapes Formula & Peruvian Guano Co., New York City.
 Martin Fertilizer Co., Philadelphia, Pa.
 McCabe Fertilizer Co., Charleston, S. C.
 Meadows, E. H. & J. A., New Bern, N. C.
 Meridian Fertilizer Co., Meridian, Miss.
 Miller Fertilizer Co., Baltimore, Md.
 Morris Fertilizer Co., Atlanta, Ga.
 Mutual Fertilizer Co., Savannah, Ga.
 New Bern Cotton Oil & Fertilizer Mills, New Bern, N. C.
 Nitrate Agencies Co., New York City.
 Ober & Sons Co., G., Baltimore, Md.
 Olds & Whipple, Hartford, Conn.
 Ontario Fertilizer (Ltd.), Toronto, Ontario, Canada.
 Pacific Guano & Fertilizer Co., Honolulu, Hawaii.
 Painter Fertilizer Co., E. O., Jacksonville, Fla.
 Pamlico Chemical Co., Washington, N. C.
 Pelham Oil & Fertilizer Co., Pelham, Ga.
 Phosphate Mining Co., Savannah, Ga., and New York City.
 Piedmont-Mount Airy Guano Co., Baltimore, Md.

Mr. SILVER. One of the interests that I did not mention is the water power interests, who had Mr. Cooper to testify on the other side. I have a list of the groups which they represent, and if there is no objection, I would like to have that go in, and I will offer the other at another time.

The CHAIRMAN. All right.

(The list submitted by Mr. Silver is as follows:)

Mr. Cooper is vice president and a director of the Mississippi Power Co. which sells power to St. Louis, East St. Louis, Hannibal, Alton, Quincy, Burlington, Fort Madison, Keokuk, and adjacent territory. It is one of the largest hydroelectric plants in the world.

Stone & Webster Co. (Inc.) is the general manager of this company.

The following companies are managed and operated under this same management:

Baton Rouge Electric Co.
 Blackstone Valley Gas & Electric Co.
 Cape Breton Electric Co. (Ltd.).
 Central Mississippi Valley electric properties.
 Columbus Electric Co.
 Columbus Power Co.
 Columbus Railroad Co.
 Connecticut Power Co.
 Dallas City Illinois Light Co.
 Eastern Texas Electric Co.
 Edison Light & Power Co., Abington and Rockland.
 Edison Electric Illuminating Co., Brockton.
 El Paso Electric Co.
 Fall River Gas Works Co.
 Fort Madison, Iowa, Electric Co.
 Galveston Electric Co.
 Galveston, Haston Electric Co.
 Galveston, Haston Electric Railway Co.
 Haverhill Gas Light Co.
 Houghton Company Electric Light Co.
 Houghton Electric Traction Co.
 Key West Electric Co.
 Lowell Electric Light Corporation.
 Millerton Electric Light Co.
 Mississippi River Power Co.
 North Texas Electric Co.
 North Texas Traction Co.
 Nova Scotia Tramway & Power Co. (Ltd.).
 Pacific Northwest Traction Co.
 Paducah Electric Co.
 Pawtucket Gas Co., New Jersey.
 Ponce Electric Co.
 Public Service Investment Co.
 Puget Sound Electric Railway.

Puget Sound Interurban Railway & Power Co.

Puget Sound Power & Light Co.

Reno Power, Light & Water Co.

Savannah Electric Co.

Savannah Power Co.

Sierra Pacific Electric Co.

Sydney and Glace Bay Railway Co. (Ltd.).

Tacoma Railway & Power Co.

Tampa Electric Co.

Tarrant County Traction Co.

Trucker River General Electric Co.

Mr. SILVER. To get back to the board's proposal specifically and to discuss some features of the proposal itself, he agrees to form a company with \$10,000,000 capital stock, and he has that much at stake, at least, that he will keep faith with the contract made with the Government. They have the right in the contract to cancel on him if should not do that.

He agrees, further, that he will complete Dam No. 2 at cost and without profit to himself. That, of course, is important, for when he agrees to do that he keeps in mind that he must do it economically and right, for he agrees to reimburse that amount and pay interest on it while he does it, which is exactly the reverse of the cost-plus contracts during war times, which caused a great deal of unhappiness to taxpayers.

He will lease Dam No. 2 for a hundred years and pay 4 per cent interest upon the cost at completion. That is another way of stating about what I did state.

Ford will pay annually \$35,000 per year for repairs, maintenance, and operation of Dam No. 3, its gates and locks, the company to maintain power house and machinery.

He will furnish free 200 horsepower to operate locks.

He will construct Dam No. 3 at cost without profit.

He will lease Dam No. 3 for 100 years and pay 4 per cent interest on its cost, including lands and flowage rights.

He will pay annually \$20,000 for repairs, maintenance, and operation of Dam No. 3, its gates and locks, the company to maintain power house and machinery.

He will furnish free 100 horsepower for the operation of the locks.

He will establish a sinking fund by the semiannual payment of \$23,373.

Both dams are to be built at cost, without profit, in accordance with the specifications of the United States engineers. Looking ahead to lease provisions, where the company agrees to lease the finished work for 100 years and to pay 4 per cent interest on the cost of construction, we find a construction arrangement that guarantees both quality and economy of construction. The company constructing is to use the property for a hundred years, and is therefore vitally interested in the quality of the work. The company also agrees to pay 4 per cent interest on the cost, and the resulting condition is exactly opposite to the much-criticized cost-plus method of construction.

As to the financing of construction, no appropriation is required from the Treasury to complete Dam No. 2 or to build Dam No. 3. The proposal agrees to pay 4 per cent interest on the cost of constructing both dams, and, further, provides a sinking fund which at the end of the lease period will retire \$48,000, which is more than will be required to finish Dam No. 2 and to build Dam No. 3.

The CHAIRMAN. Where will he get the money to build Dam No. 2, for instance, if no appropriation is necessary.

Mr. SILVER. From the authorization of bonds.

The CHAIRMAN. Oh.

Mr. SILVER. Authorize the sale of bonds.

The CHAIRMAN. Oh, yes; his proposition is to get that money by the sale of bonds.

Mr. SILVER. Yes.

The CHAIRMAN. That is not Ford's offer. Of course, it does not make any difference to Ford how we get the money.

Mr. SILVER. No; he does not provide for the method of getting the money in the contract, but all he proposes is to amortize and issue the amount of bonds necessary, estimated as \$40,000,000, to retire them, and he would pay back with interest on \$53,000,000 all told.

The CHAIRMAN. Have you ever computed what this interest would actually do for what the Government is out on these dams. Of course, it would be a great deal less than 4 per cent that we are really giving the money to Mr. Ford at. Did you know that?

Mr. SILVER. I do not know that I catch what you mean.

The CHAIRMAN. Well, we have already spent \$17,000,000.

Mr. SILVER. Yes; I understand that.

The CHAIRMAN. We do not get anything from that.

Mr. SILVER. No.

The CHAIRMAN. We donate that.

Mr. SILVER. That is one of the war wastes.

The CHAIRMAN. And Mr. Ford does not commence to pay interest until after the dam is completed.

Mr. SILVER. Well, he can not well use it until after the dam is completed.

The CHAIRMAN. I am not criticizing that.

Mr. SILVER. No.

The CHAIRMAN. You are jumping at conclusions. Now, we will have to supply the money?

Mr. SILVER. Yes.

The CHAIRMAN. Assuming that it takes two or three years to finish that dam—

Mr. SILVER. Yes.

The CHAIRMAN. We will be out of the use of most of it for that time, without any interest.

Mr. SILVER. I do not know what length of time it will take. Mr. Ford, in talking with the Secretary of War, thought it might be done in a year's time. Some of the engineers who passed on it said that 18 months would be a sufficient amount of time.

The CHAIRMAN. Well, the Government engineers say three years, and Mr. Ford's engineer said two years, or perhaps a year and a half, as I remember it. The very lowest was a year and a half.

Mr. SILVER. Yes; I think that was the lowest that the engineer said.

The CHAIRMAN. Yes. Now, you were not through with that statement?

Mr. SILVER. I will just finish it.

The CHAIRMAN. Yes.

Mr. SILVER. At the end of the lease period, he will retire \$48,000,000, which is more than will be required to finish Dam No. 2 and to build Dam No. 3. In other words, he pays back more than the entire amount.

The CHAIRMAN. No; now, do not let us get that wrong. He does not pay back nearly as much as it cost.

Mr. SILVER. You did not let me finish. He pays back more than this additional investment that is asked for.

The CHAIRMAN. Yes.

Mr. SILVER. He does not pay back the investment that is made down there now.

With these provisions, a bond issue floated at 4 per cent to finance the necessary expenditure, without any appropriation, and the interest on and retirement of the bonds are to be paid by the company.

We submitted to the Secretary of War a letter on that question. That raised the question with the Secretary of War, and I would like to read that at this time, if I may, Mr. Chairman.

The CHAIRMAN. All right.

Mr. SILVER. It is dated January 9, 1922:

Hon. JOHN W. WEEKS,

Secretary of War, Washington, D. C.

MY DEAR Mr. SECRETARY: In turning over in my mind our conference on Mr. Ford's proposal to take over the Muscle Shoals development, and considering the various phases of the situation, I realize that the most serious difficulty appears to be the question of securing an appropriation at this time of heavy expenditure.

In searching for a solution it has occurred to me that an authorization for a Muscle Shoals bond issue of \$40,000,000 would remove the necessity for an appropriation. I am confident that under present conditions such a bond issue could be floated at 4 per cent. The interest payments of Mr. Ford amounting to \$1,680,000 annually would pay 4 per cent interest of \$42,000,000 of bonds. He provides an amortization fund through which the bonds would be retired at the end of the 100-year period. It would be my thought to issue the bonds for 50 years, at which time the sinking fund would have accumulated to the point where a reissue might be floated at a lower rate of interest. By this means the Government would secure the development of this power with no additional appropriation and have amortized nearly one-half of the present war-time expenditure of \$17,000,000 on the dam, since the amortization fund will in addition to retiring the bond issue of \$40,000,000 retire \$8,000,000 additional.

Should this suggestion meet with your approval we shall be glad to cooperate with you in securing the adoption of this plan of financing the development.

Very truly, yours,

AMERICAN FARM BUREAU FEDERATION.
GRAY SILVER, *Washington Representative.*

The CHAIRMAN. You might be able to do it in a year or so if things keep on improving, but I do not believe we could sell bonds now at par at 4 per cent.

Mr. SILVER. I would think so, Mr. Chairman.

The CHAIRMAN. Would you?

Mr. SILVER. Yes, sir; I do think so.

The CHAIRMAN. Four and one-quarter per cent bonds, with some tax exemption features, can be bought for less than par on the market right now.

Senator HEFLIN. These are the farm-loan bonds.

Mr. SILVER. Four and one-half per cent.

The CHAIRMAN. Yes; but the thing that makes the farm-loan bond sell is the fact that it is exempt from all Federal and State taxation, while United States bonds are only partially exempt.

Mr. SILVER. Some issues of them; yes.

The CHAIRMAN. Practically all of the Liberty bonds.

Mr. SILVER. Yes.

The CHAIRMAN. They pay 4½ and are selling now below par. How could you expect a 4 per cent bond to sell for par now unless it is completely exempt from taxation, income, and Federal and State taxes of all kinds? That is not of very great importance, but I think we ought to face it as it is.

Mr. SILVER. I think so, too.

The CHAIRMAN. And I do not see how you could sell a 4 per cent bond at par.

Mr. SILVER. You may be right, Mr. Chairman, but I am of the opinion that, if necessary, the farmers of the country would buy them to see this project completed and put on an earning basis—that is, to reduce costs to them, that they might supply their needs on a less cost basis.

The CHAIRMAN. Well, I would not want to fool the farmers that way. I have always been square with the farmers, and I am not going to go into any deal to try to deceive them. I will not say to the farmer, "You buy these bonds and pay more than they are worth on the market, pay par for them, on the theory that five or six years from now, when Ford gets started, he is going to show you farmers something," when I have no way to guarantee that he will do it. In my heart I do not believe he will do it. He will probably die in a very few years, and his corporation will be just as heartless as any other corporation.

Mr. SILVER. I would not impose upon the farmer, if I could, but I do believe that the development there will result in a less cost factor to them, and besides 4 per cent is above the average for Government money.

The CHAIRMAN. The man who does it will be able to make a profit out of it I know, and that is the reason I want to save it for all of the people instead of giving it to one man, even though he is a good man, and there are other men in the country just as good as Ford. I think he is a good man, but I know some others I think just as much of and I would not want to let the Government furnish them with \$40,000,000 or \$50,000,000 on a hundred-year time basis at 4 per cent in order to enable them to do something cheaper, either.

Mr. SILVER. In all of my testimony you will notice, Mr. Chairman, that it has been the accomplishment of a purpose rather than Mr. Ford individually. Whilst I have the greatest confidence in Mr. Ford, and I do not think he is the only good man in the country, but he is the only good man who has bid for this property, and consequently he is in a class to himself so far as that is concerned. I might pick out other people that are splendid, high-class men, but if they are not bidders they do not come into consideration here.

The CHAIRMAN. Sure, if I were to give this snap to anybody I would rather give it to Ford than a good many other people I know, but I do not want to give it away because it is Ford.

Mr. SILVER. I am not looking at it from the viewpoint that you do, because you take a natural resource and make it work for the people to whom it belongs. That is not giving it away. It is simply the Government, the people's representatives, putting it to work for them.

The CHAIRMAN. That is where you are mistaken. There is where your statement is entirely wrong. You have not anything to base it on. There is nothing in the record that will sustain you. You are not developing this for all the people. You propose, yourself, to give it to Mr. Ford's corporation, which is going to run it for a hundred years, and you assume, to begin with, that the people are going to get the benefit of it, when there is not anything in the contract to that effect. Mr. Ford does not agree to it even while he lives. You are assuming all of those things and there is nothing to it.

Senator HEFLIN. But it will be drawn up in the contract; those things, so far as fertilizer is concerned, will be put into it.

The CHAIRMAN. Then draw the contract accordingly.

Senator HEFLIN. But he proposes to manufacture fertilizer, and get it at half cost, because he has not guaranteed that he will not. There is no question about that, and nobody expects him to make that kind of a contract, and Mr. Ford will tell you to-day that he will not do it. If you put the contract under his nose he will refuse to sign it.

Mr. SILVER. I would like to have something further to say on that, but I would like to go ahead with my statement now just to keep it in sequence.

The CHAIRMAN. All right.

Mr. SILVER. As to the lease of the dams, the lease for 100 years is justified from the standpoint that at the end of the lease period the development is returned to the Government with all capital charges against the water power wiped out, and from then on the power is free from interest charges.

The CHAIRMAN. Now, just a minute on that. You say at the end of a hundred years there is going to be returned to the Government, but all of the other property is given to Ford free from every obligation, or to this corporation for a hundred years. At the beginning of this thing the Government has the dams and the Government has all of the other property. At the end of the hundred years the Government is going to have the dams free, but this corporation is going to own the balance of the property.

Mr. SILVER. That is property that they have either bought or constructed there.

The CHAIRMAN. It is what they bought.

Mr. SILVER. But if they develop this property they will have a great investment there, of course. That will be their private interest and private development.

The CHAIRMAN. What they may develop there will be theirs, that is all right, but at the end of a hundred years the Government won't even own this nitrate plant: it will not have any contract with Mr. Ford that he will operate the nitrate plant. If, in 101 years we would have another war, we would be without any nitrate plant, and Mr. Ford would not be under any obligation to operate a nitrate plant.

Mr. SILVER. At end of period the Government will own two dams completed which it has not got to-day and will not have paid for them. Full nitrate equipment will be there probably much improved; will have saved maintenance and depreciation cost over the entire period.

Senator HEFLIN. You could commandeer it.

The CHAIRMAN. Sure we could, but we would have to pay for it if we did, and we have it now.

Mr. SILVER. Do you think for a minute, Mr. Chairman, that if Mr. Ford did not come along, and if you let that plant stand free from cost, that you would have a plant?

The CHAIRMAN. Yes; if we passed the bill that I have introduced, at the end of 100 years the difference will be that we will have the plant and water both and own it all, just as we do now, and it will all be paid for long before the hundred years is up.

Mr. SILVER. But the cost of keeping that plant in standby condition is considerable.

The CHAIRMAN. No; but we would use it. If Ford can use it we can use it.

Senator HEFLIN. But Ford will have paid to the Government at the end of 100 years more than the Government will have spent originally.

The CHAIRMAN. No; not by a good ways. He gets what the Government has spent. The Government has spent, in round figures, \$100,000,000 now. He just gives us \$5,000,000 for that, and at the end of that time we are to get back from Ford the dams, not what they cost, but what it takes from now on to complete them. That is what Ford pays back.

Senator HEFLIN. Does it not pay it back with interest, and will not all of the payments that he makes at the end of 100 years amount to as much as the Government has invested?

The CHAIRMAN. No; I do not think so, but that would not be any criterion, anyway.

Mr. SILVER. He pays back \$53,000,000 plus the interest, which would exceed it, but I was not adding that interest as we went along.

The CHAIRMAN. Of course, he pays 4 per cent interest. If we should put the proposition up to Morgan to-morrow to build any kind of a plant in Chicago or Omaha or out in the country some where, a big manufacturing plant, and tell him that we would furnish the money to him for 100 years at 4 per cent interest, and let him pay it annually and amortize it over 100 years, he would jump at the chance. There are thousands of men in the United States that would go into all kinds of things. You say he will be able to make those things cheaper. There is not any doubt about it, but if we had a guaranty that he would sell them cheaper to the consumer than we are paying now, you would have a different proposition, but that is not in the offer of Mr. Ford's corporation.

Senator HEFLIN. And nobody else has offered it.

The CHAIRMAN. Of course, they have not offered it. I am not claiming that they have. The Government owns this property and built it as a war-time proposition.

and I want them to keep it. I would not want them to give it to anybody, even though he were better than Ford; even though he were a preacher, I would not want to give it to him.

Mr. SILVER. Let us go down through this list and we will discuss that a little further. I will go on from where I left off above.

When it is realized that interest on capital invested is 80 per cent on the cost of electric power from a hydroelectric development, this method of amortizing the investment and relieving the power of interest charges is most valuable to the people. This interest cost is also the reason that the Government should loan its borrowing capacity to finance the building of the dams. Since interest charges are so important a factor in the cost of power, the lowest interest rates obtainable should be utilized in developing our great water power resources. Since these water powers are looked at as belonging to the people, the collective borrowing capacity of the people, through their Government, should be utilized to finance the development of these water-power resources. This is especially true since it puts no expense on the Government nor on the people and so greatly reduced the cost power developed.

As to navigation, the company pays the expense of operating the locks and furnishes free power for this purpose. The amounts of money and power furnished have been approved by the United States engineers as ample for this purpose. In addition to securing the navigation development free of cost, the Government also obtains the operation of the locks without expense.

No navigation at all is provided unless both Dam No. 2 and Dam No. 3 are built.

In addition to the navigation feature, Dam No. 3 can undoubtedly be built more cheaply by constructing it as workmen and equipment are released from Dam No. 2 than it could be built separately at a later date. As to the tying in or power, to obtain the fullest possible development of the potential power at Muscle Shoals, Dams No. 2 and No. 3 should be jointly operated and coordinated so as to supplement each other. Unless both dams were so operated no one would be justified in making the additional investment in storage reservoirs in the upper river to equalize the flow of the river, as is indicated in the hearings, is the purpose of Mr. Ford.

Now, going again to paragraph 11: Purchase (a) nitrate plant No. 2, (b) nitrate plant No. 1, (c) Waco quarry, (d) the ownership of the Government in the Gorgas steam plant. That is what he proposes to purchase for the amount of money that he states in his tender.

The CHAIRMAN. \$5,000,000?

Mr. SILVER. Yes.

The CHAIRMAN. Do you know anything about how the Government's interest is tied up in the Gorgas plant? Have you studied the Government's contract with the Alabama Power Co. when that was built?

Mr. SILVER. I have not. Senator, although I have heard a great deal of discussion about it, but personally I have not studied that feature, as Mr. Ford is willing to take the place of the Government it is not important.

The CHAIRMAN. All right. We can not expect you to discuss it if you have not studied it.

Mr. SILVER. As to the purchase of nitrate plants and so forth, the purchase price of \$5,000,000 has been criticized as too low, but when it is realized that the proposal provides for the operation and maintenance of the nitrate plant at its present capacity, this sale must be looked at from a different light.

The CHAIRMAN. Well, the operation of the nitrate plant comes not as a part of the consideration of the sale of the property, as I understand it?

Mr. SILVER. Oh, yes. He agrees on that as part of the tender to operate it and keep it a going concern, to keep it up and to pay for the use of it any time he may need it.

The CHAIRMAN. Well, he expects to make money on that proposition. He is not going to make 8 per cent interest, but that is the thing where Mr. Ford feels able to make this agreement to operate that plant. That is the power at the dams. There is no doubt about that. That is where the cream is in the contract.

Mr. SILVER. I do not know that I quite get that.

The CHAIRMAN. Mr. Ford has all the power that is developed at Dams Nos. 2 and 3?

Mr. SILVER. Yes.

The CHAIRMAN. And it is net to him, except what power it takes to operate the nitrate plant.

Mr. SILVER. The nitrate plant is what he has contracted to do in this particular clause.

The CHAIRMAN. That will take only about one-third of the water he develops, or not that much, I guess.

Mr. SILVER. He pledges that he will develop that much. That does not mean that he won't use it.

The CHAIRMAN. It does not mean that he will have to use more, and of course will not, unless it should be profitable to manufacture more fertilizer.

Senator HEFLIN. I believe he will make it profitable.

The CHAIRMAN. Well, he probably will if he gets it, but it is a great thing that he will get. He will get pretty nearly \$100,000,000 worth of property for \$5,000,000, and that is not the big profit. The big profit in Ford's proposition is the power that he gets with which he can turn the whole earth around on its axis, pretty nearly, and it will not cost him anything. He gets it for nothing. He will pay it back, the principal and interest, at 4 per cent, but he will make it out of that power, and that is what he expects to do.

Mr. SILVER. Well, I should think he would make it, but he turns back to the Government a completed, paid-for, and developed property for the use and benefit of all the people. He pays back to the cost in full; he pays interest at 4 per cent for the entire period; he assumes the burden for the operation of the nitrate plant which perhaps may be larger than we appreciate; he agrees to maintain a research on commercial scale into the whole fertilizer field and employ new processes. This will take 100,000 horsepower as a minimum all the year round. There is only 140,000 primary all-the-year-round power at both dams. He will have to invest in storage reservoirs to make the power valuable at costs conservatively figured at \$20,000,000. There are some of the things he pays money for. Then he maintains an adequate nitrogen protection for the Government free; he bears all maintenance and depreciation charges on the plant; he furnishes navigation scott free. So it is not such a one-sided problem when you analyze it closely.

The CHAIRMAN. Oh, yes.

Mr. SILVER. And the public has all the time enjoyed their equity in it.

The CHAIRMAN. Yes; he turns that back at the end of a hundred years in good condition, but that has all been built out of Government money; the taxpayers furnishing it all, and Mr. Ford has not put a single dollar in the development of the power, or not a penny. He will spend a whole lot of other money in building factories, but he will not turn them over to the Government. They will be his. He will build them and operate them with this power that he gets from the Government for nothing.

Senator HEFLIN. He will be doing a lot of good with them, Mr. Chairman.

The CHAIRMAN. I think he will. I have no doubt of that.

Mr. SILVER. Would you simply say that he did that all at Government expense, when he has returned the Government's money?

The CHAIRMAN. He is going to build these dams at Government expense. I do not mean any of his private property.

Mr. SILVER. But he returns it all.

The CHAIRMAN. Of course he does, but he makes it out of the very thing that he built with the Government's money. If does not cost him a penny.

Mr. SILVER. If he did not, he certainly would not agree to make the money elsewhere and retire the Government's investment which many people in and out of Congress advised junking a year since.

The CHAIRMAN. Mr. Silver, if we entered into a contract to-day with him, he could go on to Wall Street to-morrow and sell it for \$50,000,000 cash. One witness has testified that and I think he is very low in his estimate. Of course, if that is the best thing we can do we ought to give it to him anyway.

Senator HEFLIN. Why is it that some of these interests do not come here and make a better offer for it than Mr. Ford, if that is the situation?

The CHAIRMAN. I would not accept it if they did, Senator. You can not scare me with that sort of a proposition. I would not sell it to anybody.

Senator HEFLIN. I am in doubt as to whether this \$50,000,000 proposition is in existence; that is all I mean.

The CHAIRMAN. It probably is not in existence, but I can see it. It is perfectly plain. In the first place, if Ford should get this tomorrow, he could turn around to the Alabama Power Co. and, in my judgment, he would get \$3,000,000 right off for the Gorgas plant. I do not know anything about it, except I know how it is located and what use they have for the power, and they can afford to pay that for it.

Senator HEFLIN. There is no doubt that these coal mines around the Gorgas plant need the power they now get from the Gorgas plant.

The CHAIRMAN. Oh, yes; they could sell the power. There is no question about that.

Senator HEFLIN. But Mr. Ford will not deny them the use of that power. I am satisfied of that.

The CHAIRMAN. I do not care whether he does or not. All I care for is the people of the United States, particularly the farmers, whom I think you fellows are all fooling. They are going to wake up to it some day.

Senator HEFLIN. We are trying to relieve them. I hope we are not fooling them.

Mr. SILVER. If there is a margin of \$50,000,000 on that property just by the Government's act, why did not somebody bid when it lay idle down there and without friends. All of these special interests said it was worthless and was junk, and they did what they could to see that the Government did not develop it.

The CHAIRMAN. If J. P. Morgan came here with Mr. Ford's proposition, and Congress accepted it, you would be writing letters to all of the farmers all over the United States condemning this Congress, saying that they had sold the rights that belonged to the people and to their unborn children. You would be condemning them, and I think rightfully. That would be the cry that would go out, that Congress has sold out this great possibility down there that the people ought to retain to a corporation. That is just what you are asking us to do now because it happens to be popular. Ninety-nine per cent of the letters that I am getting from all over the country about this proposition say, "Give this to Ford." And when I ask some of them, "What do you know about Ford's offer?" they say, "I don't know anything about it; it is Ford; that is all I know." And that is what you are doing to-day, notwithstanding the fact that a year ago this same organization went on record to the effect that these things should be preserved for all time. Now, if I were suspicious—and I do not have any suspicion; I am not questioning your motives—but if I were half as suspicious as you are, I would be wondering in your own mind how it is that you flopped over from one proposition to another, and I would say, "Why, this great big corporation has bought all of these men; it has bought the organization, and they have it now. A year ago they did not have it. You stood for retaining this property in the Government of the United States for all the people, and now you have reversed your position and you want us to give it to a corporation." If I was at all suspicious, that is what I would think.

Senator HEFLIN. But the Government abandoned the other proposition there.

The CHAIRMAN. No; the government did not abandon the proposition. I beg your pardon.

Senator HEFLIN. I mean they quit working there.

The CHAIRMAN. I went so far as to draw a bill, and I carried out that very same proposition with this same bunch of farmers. Now, I expect them to be condemning me as selling out, because I will not sell out to Ford's corporation, but I am advocating the very thing that they asked us to do then.

Mr. SILVER. Mr. Chairman, I tried this forenoon to make plain one feature, but it seems that I have not. This is the report of the committee. This report was made on—have you the date there?

The CHAIRMAN. May 31, 1921, that report was made.

Mr. SILVER. Now, I tried to make plain that that is the report of the committee appointed by the federation to make this investigation and report, and they did so, but at the next annual meeting following that, when this matter came up for ratification by the delegates at large, they passed the resolution which I read into the record here, approving Ford's tender.

The CHAIRMAN. Yes.

Mr. SILVER. I just wanted to get that straight in the record.

The CHAIRMAN. Well, I have all of that straight. That is nothing new. I knew that.

Mr. SILVER. But you just said now that the organization had flopped.

The CHAIRMAN. It has absolutely flopped.

Mr. SILVER. But there is a difference there and I wanted to emphasize that. I wanted to get it straight in the record, so that the reader will understand it. It is the difference between a committee report and the action of the convention.

The CHAIRMAN. Oh, yes, I will concede that there is a difference.

Mr. SILVER. I wanted to be sure of that.

The CHAIRMAN. Do you want us to believe, then, that this report of the Committee on Muscle Shoals, made a year ago by the committee that investigated it, which went on the ground and studied it, has been repudiated by the organization that sat up here in Chicago or somewhere and did not go on the ground and did not know anything about it except what they read in the newspapers or what somebody told them about it?

Mr. SILVER. The annual convention was held at Atlanta. A great many of them coming from the west and the southwest stopped at Muscle Shoals on their way to the convention, and it was a matter of debate on the floor and they arrived at their conclusions. Now, you and I might have the same facts and arrive at a different conclusion.

THE CHAIRMAN. Oh, yes.

MR. SILVER. Those facts are not questioned. They had the utmost confidence in their committee, and they believed the facts to be the facts, and they went on the ground, and the resolution itself speaks of the conclusion which they arrived at.

THE CHAIRMAN. Yes.

MR. BOWER. Of course, Senator, there is one thought in there that you appreciate. This report was made, of course, before there was any Ford proposition.

THE CHAIRMAN. Yes; I understand that. I am not saying that you had not a right to do just what you have done, but what I am calling your attention to—and I am not questioning the sincerity of anybody in doing that—

MR. BOWER. Oh, we know that.

THE CHAIRMAN. But you have already offered in evidence things here to show that a whole lot of what you call special interests are opposed to this proposition. Now, if I were half as suspicious as you are I would wonder what happened to you. When you got down there under the influence of a local condition existing in Alabama where a man would not be safe if he would not put a badge on and say "I am for Ford," and where, if they caught him without a badge they would hang him up to the first tree—you were down in that locality—

SENATOR HEFLIN. I do not think it is quite that bad, Mr. Chairman.

THE CHAIRMAN. You would naturally be in favor of Ford. If I were inclined to be suspicious I would say, "Ford has bought you; you have sold out to Ford or to his corporation."

MR. BOWER. I think, instead of anything like that having happened—and, of course, you realize that that did not happen, what happened was that the Ford proposal was made afterwards. We had no Ford proposal when that resolution was adopted.

THE CHAIRMAN. I understand that.

MR. BOWER. Ford made a proposal, and the convention indorsed his proposal in preference to Government operation.

THE CHAIRMAN. Well, I do not believe the farmers of America prefer the Ford proposition in preference to this committee report that was the result of so careful an investigation. I do not believe it, notwithstanding the Atlanta Convention went on record to that effect, and I do not believe that the farmers or any other group of our citizens will uphold any action of Congress that will give away these valuable rights which you have so nicely described, belonging to all the people, to any dam corporation. I do not care whether it is Ford's or anybody else's, and it is not any better because it is Ford's, unless Ford is there to manage it, and then I concede it will be better; but you all know that Ford is going to die very soon, and then it will not be any better than Morgan's nor Rockefeller's, not a particle. It will be just the same, and you know, Mr. Silver, that if Rockefeller was making this proposition, or the International Harvester Co. was making this proposition that Ford makes, you would be here condemning it, and all of your fellows would be condemning it. There is not any doubt about that.

MR. SILVER. With knowledge of the fact that Mr. Rockefeller and the Standard Oil Co. have exploited these natural resources as they have, for private purposes, I think I would agree with that, because their record shows that they have an entirely different point of view from what Mr. Ford has in business.

THE CHAIRMAN. Sure, and your corporation will not be any better than Rockefeller's corporation.

MR. SILVER. I do not subscribe to that.

SENATOR HEFLIN. You can put it in the contract.

THE CHAIRMAN. You can not put it in writing. I will defy anybody to try to draw a contract that will make it so after Ford's death. This corporation will be just the same as every other corporation. Anybody who gets control, who gets ownership of more than one half of the stock, will control it, and the stock will sell, in my judgment, immediately—if it should be organized to-morrow and Ford died the next day, and you were the owner of some of that stock as one of his descendants, you could get an advance of 1,000 per cent. right down on Wall Street, for this valuable contract.

SENATOR HEFLIN. But whoever gets it, Mr. Chairman—

THE CHAIRMAN. I do not want anybody to get it.

SENATOR HEFLIN. But I say, whoever does get it, after he dies, the corporation is bound by the Government. They have agreed with the Government to manufacture fertilizers at 8 per cent.

THE CHAIRMAN. But, Senator, you know there is not any such guaranty in that contract.

SENATOR HEFLIN. But you can put it in there.

THE CHAIRMAN. You will not get Ford's signature if you do.

SENATOR HEFLIN. Well, he agrees that he will make it.

The CHAIRMAN. Even if that were true, that only makes the contract all the more valuable. I do hope that they can make a profit on it, but if they do it only adds more to the value of the contract, because I am assuming that this nitrate plant No. 2 will be a load around his neck. I am inclined to think it will, from the evidence. If we have a new invention, as I think we will eventually, that load will be lessened, and it may turn it into a profitable thing, but every time it does it only adds to the value of his contract. The great big thing that he has in his contract is that he gets 500,000 or 600,000 horsepower for nothing. He constructs it out of Government money and then pays it back out of the profits from the very thing that the Government's money built. That is too much of a loss for the people of the United States to sustain. We ought to get the benefit of these great natural resources.

There is another thing you must not forget. One of the most dangerous things in government or business is a precedent. You are asking us to do something here that we never have done for anybody since we passed the general dam bill. By that Act we said we would not do it for anybody, that we would not jeopardize this valuable property anywhere, any of these resources, for longer than 50 years. Now, you would break that precedent for Ford. Next year, there will be some other man who will be shown to be of mighty good moral character, and we will do it for him. The result is that by the time we have reached a certain stage all of these valuable resources will be gone, and every man who has his hands in it will be condemned by honest citizens.

Mr. SILVER. I have more confidence in the people than you seem to indicate you have.

The CHAIRMAN. But I think they are more intelligent than you seem to think.

Mr. SILVER. Columbus went out on a great uncharted sea when he started out to discover this country, and he felt sure that there would be on this land, if he found it, an administration of government. Washington went out on a great uncharted sea when we had trouble with England, feeling that if we kept this land we would have a proper government and an administration of government. Lincoln, when we had this feeling between the states, went out on an uncharted sea, and you, as a member of Congress, when we went to war with Germany recently, went out on an uncharted sea, feeling that no matter where we came out we would have government for the welfare of the people.

There is a change in the theory of the economic world, but we go on an uncharted sea to a certain extent, and when we do so we have belief and faith in the genius of our people and our institutions, and when you have once set up a development of the natural resources on a less cost basis, the people will certainly still function through their Government and have control of the things that are for the welfare of the people.

The CHAIRMAN. Oh, yes, if you make a contract for your government to last for a hundred years, will the people be able to function through that government?

Mr. SILVER. Absolutely.

The CHAIRMAN. Won't that be gone for a hundred years, or are you assuming that we are going to violate our contract with this corporation?

Mr. SILVER. The right to tax is the right to destroy.

The CHAIRMAN. Oh, I see.

Mr. SILVER. When they see that this corporation or any other corporation is doing a bad thing the Congress of the United States will act. You acted recently in the Packers case, although it was enjoying no special privilege from the Government. You acted in the grain control case and many other cases. I just mention those ones because they are outstanding, and when the condition arises which you seem to think will arise in the future, if this tender is accepted, the government agencies will function. That is my belief.

The CHAIRMAN. Of course they will function.

I do not say that the Government is going to fail because we give Ford's corporation a great big cinch on things, but we are giving away something; there is no doubt about that, and you, Mr. Silver, certainly will not stand up here and say that if we do not like the way this thing works we are going to break our contract and violate our word. We must keep this contract for a hundred years if we make it.

Senator HEFLIN. But Ford's corporation must keep it, too.

The CHAIRMAN. Sure; they will not have very much to keep.

Mr. SILVER. And we will have governmental institutions to see that the faith is kept by all parties and for the benefit of all the people, I believe.

The CHAIRMAN. Exactly, but there is not any contract made with the corporation but what gives it the right to charge any price it pleases for anything that it makes there. You have no control over a single kilowatt of that power, and no corporation ever made a more unconscionable contract, as far as taking the rights of the people is concerned than you get here, where you have no control whatever over any price for anything that may be developed there. Now, if you want to retain the rights of the people, you

ought to provide in your contract that somebody shall see that nobody shall profiteer on account of this great favor that the Government is extending, even though it is to Mr. Ford. If it was Jesus Christ I would want that in the contract, and I know He will live longer than Ford will. You cannot get away from that.

Mr. SILVER. There was no contract made with the railways when this Government and the State governments gave great land grants out West, more than there is in the great States of Indiana, Illinois, Ohio, and Pennsylvania, but we did afterwards set up a regulatory body in the Interstate Commerce Commission.

The CHAIRMAN. Oh, yes.

Mr. SILVER. And they do all the regulating they see fit.

The CHAIRMAN. But we did not do anything to violate our contract by which we had given the land, and you say now that we did right when we gave away all of that land to the Union Pacific Railway Co.?

Mr. SILVER. I was not justifying it, but I was illustrating the point, that in making the contract you are not giving away the governmental right of regulation.

The CHAIRMAN. Exactly, but you would not regulate this corporation any different from any other corporation. We gave to the Union Pacific millions of acres of land in my State, worth \$250 an acre now. We gave it to that railroad for nothing. Millions of acres. When we came to regulate the Union Pacific Railway, the same regulation that road applies to the Burlington, to which road we gave nothing.

Now, you talk about the regulation of these corporations. If we ever do regulate corporations of this kind in any way we will treat this corporation the same as any other that has not been given special privileges. The parallel that you have given of our Government giving away lands to build the railroads is a good illustration. We are giving away here the rights of the people in the power that shall be developed in the Tennessee River, and we will be condemned just as much as those men are condemned now who gave away those public lands to these railroads.

Mr. SILVER. But we are in no way waiving our right to control nor are we giving away our property, for we sell or lease for the people's welfare.

The CHAIRMAN. Certainly, and we did not in that case.

Mr. SILVER. That is the point I wanted to make in that illustration.

The CHAIRMAN. Yes. Well, there is not anything in the point.

Senator HEFLIN. We will help the cause of navigation by building this project and letting Mr. Ford have it. With that power that we now can not use he will manufacture fertilizer there for a hundred years. He will increase the fertilizer supply and will free the farmers from the Fertilizer Trust, and all of that is very advantageous to us, Mr. Chairman.

The CHAIRMAN. If you give this to Mr. Ford, you won't have the water to control next week.

Mr. SILVER. The purpose for which the Government built this plant is fully protected by this provision of maintenance and operation of the nitrate plant. It is always available in efficient operating condition for the use of the Government in time of war. A low estimate of depreciation, maintenance, and guarding charges is \$2,750,000 per annum. This annual saving is made for the Government by the acceptance of the offer.

A modification of the original proposal has removed the complications regarding the Gorgas steam plant, as Mr. Ford has agreed to accept what the Government can transfer under the contract with the Alabama Power Co.—

"15. Agrees to operate nitrate plant No. 2 at present capacity in the production of nitrogen and other fertilizers (capacity equal to 110,000 tons of ammonium nitrate per annum) through lease period. (a) Agrees to research fertilizer manufacture and employ such improved methods as may be found successful.

"(b) Agrees to maintain nitrate plant No. 2 or its equivalent for explosive manufacture in case of need.

"16. Limits profits on all fertilizer products to 8 per cent of fair actual annual cost of production. Agrees to a board of nine, of which seven are farmers nominated by American Farm Bureau Federation, National Grange, the Farmers' Union, and appointed by the President, confirmed by the Senate. Two members represent the company. An advisory member from the Bureau of Markets. Said board to determine cost and allowed to regulate price to limit profit to 8 per cent as above. Shall have access to books and determine territorial distribution and regulate sale to farmers, their agencies or organizations."

The CHAIRMAN. Now, let us take that up for a while.

Mr. SILVER. All right.

The CHAIRMAN. I think the evidence as given by the scientific men discloses that the burden of this whole thing is the fertilizer proposition, and that is what you want.

Mr. SILVER. We are very much interested in that, yes; for the savings annually will buy the property.

The CHAIRMAN. That is the difficult thing. We are all interested in it.

Mr. SILVER. Yes.

The CHAIRMAN. We want to get fertilizer.

Mr. SILVER. It is an essential thing to our civilization.

The CHAIRMAN. And if it is impossible, we can not get it. Now, I do not think that the thing you have just read there is of any importance, although you seem to think it is, and I may be wrong about it, that Ford shall not make more than 8 per cent on the fertilizer end of it, and to show that he will not make more than 8 per cent there is a board provided to look over the books and see that he sells it at a price which will not permit him to make more than 8 per cent.

Mr. SILVER. Yes, sir; that is right.

The CHAIRMAN. But the Government, in effect, furnishes him 4 per cent to operate it, and he agrees that he will not make more than 8 per cent out of this branch of it.

Mr. SILVER. I beg your pardon. It does not furnish him 4 per cent money to operate it.

The CHAIRMAN. I said "in effect."

Mr. SILVER. Four per cent money for the construction of the dam.

The CHAIRMAN. Yes; the dam, and the dam is one of the great factors in the operation of this plant. Now, supposing Ford made 25 per cent profit, and you make a great deal more than that on the water power feature of it, why don't you have a board appointed to see that he does not make more than 8 per cent there; that he sells the current to people so that he will not make any more than that? Why do you confine this board just to the fertilizer part of it?

Senator HEFLIN. We have a State law to cover that subject.

Mr. SILVER. Any time he sells power he comes under the State law. The State law of Alabama has that in charge.

The CHAIRMAN. Exactly. Then why don't you require him to sell it, in his bid, and you know he is not going to sell any, and he says he does not intend to sell it, and you do not expect him to sell any, do you, so that the Alabama law will not touch him?

Mr. SILVER. Whenever he sells it it will touch him.

The CHAIRMAN. He will not sell it.

Senator HEFLIN. Suppose he uses it for manufacturing purposes.

The CHAIRMAN. Exactly. That is what he is going to do. Suppose he makes 100 per cent on that part of it. Why are you so anxious in the proposition that he never will make 8 per cent, but when he comes to sell you a binder or a harrow or a plow or any other farm implement he may have a profit of 50 per cent and you do not care a damn about it; but if he is going to sell you a pound of fertilizer you do not want him to make more than 8 per cent.

Mr. SILVER. Nobody limits the price at which he sells his automobile, and all of the farmers are glad to avail themselves of that opportunity because it is the best buy they can make for the money.

The CHAIRMAN. Exactly.

Mr. SILVER. And we think that when he sells the farm implements he will manufacture them with the same degree of business acumen that he does his automobile.

The CHAIRMAN. All right. Then why do you insist on this 8 per cent theory if you have any such confidence in him?

Mr. SILVER. This is a special feature of the contract that we are very much interested in.

The CHAIRMAN. Of course you are very much interested in it, but why do you put it in?

Mr. SILVER. There is a difference in this special contract, because of that purchase right and the building existing there, and the shrinkage that has been made in the investment by the Government from the investment that you make under the contract with him, or under the state operation if he gets any business. If he sells that current he comes under the State law and if he don't he makes more supplies for the people at a cheaper price.

The CHAIRMAN. Now, you are avoiding it and you know you are avoiding it. You are not doing the square thing here. You know he does not intend to sell any. Now, if he makes a plow or makes a harrow and sells it and makes 50 per cent off of you, you do not care, but as to some fertilizer that you never expect him to make you do not want him to make more than 8 per cent on it. Why put in here that his company can not make more than 8 per cent on the fertilizer and not on the harrow on the other side of the contract?

Mr. SILVER. The harrow or any other article manufactured from the current is not included in the contract at all, for that is private manufacture and not a part of the contract.

The CHAIRMAN. I know it is not, but that is what I say. Why do you include your fertilizer in it, then?

Mr. SILVER. Because it is in the tender and he agrees to make it. He did not agree to make anything but fertilizer.

The CHAIRMAN. I understand that, but you know he is going to make something else, and that is the only reason you want to give him a lease for a hundred years—because he is going to make something so cheaply, and yet you are objecting to putting in anything that will regulate anything that he has.

Mr. SILVER. Don't say "objecting." We are urging you to give him a chance to cooperate with us.

The CHAIRMAN. You are objecting just the same, because you are not asking that it be put in, but you want to put it in here where it will not amount to a damn. When it does amount to something to the farmer, you do not ask that it be put in.

Mr. SILVER. If the fertilizer business is carried out it will save upward of a hundred million dollars a year in the buying power of the farmer.

The CHAIRMAN. That is nice; that is good, but I ask you to apply the same logic to the other end of the manufacturing establishment, where he is going to make such cheap things as you have been talking about.

Mr. SILVER. There is nothing in the contract that we can talk to on that subject, for all of that must be developed by private effort and finance.

The CHAIRMAN. Exactly. Put something in, then. There is nothing in it; you do not ask that anything be put in, but if you do not want anything put in on that end of it, I do not see any sense in seeing that it is put in on the fertilizer. When I say to you that you have no regulation under this agreement, that he may put the price up, you say, "Oh, no; Ford will not do that."

Mr. SILVER. My testimony was that I had faith in our governmental institutions, and if Mr. Ford or his corporation operates it to the disadvantage of the public, our Government would protect our interests.

The CHAIRMAN. Yes; but you know that there is not anything in this contract that requires any of the output, except the fertilizer, and that is a minor thing compared to what is coming out of it.

Mr. SILVER. And whenever the public welfare is jeopardized we have the Government to act, and it will assert itself.

The CHAIRMAN. I want to be fair with you, but you know that that is not so; you know that if we regulate anything there we have to regulate everybody else just the same. You know that we regulate the International Harvester Co. now, don't you?

Mr. SILVER. Whenever the public welfare justifies it you do assert yourselves, and will in this case.

The CHAIRMAN. You know that we can not have regulation that will affect the Ford output there unless we regulate everybody else's output at the same time.

Mr. SILVER. I know you must treat them all alike and why not? Who should be favored?

The CHAIRMAN. Exactly. Now, why do you not put a provision in the contract that you can regulate the output all the way through? You will not do that; it is not popular to do it. The only place you do it is in regard to the fertilizer.

Senator HEFLIN. That is the main thing that the farmer is interested in.

Mr. SILVER. That is all he contracts to do.

The CHAIRMAN. I know that is all he contracts to do, but the thing I put up to you is why we should give him a 100-year lease and permit him to do these wonderful things that he is going to do with this electricity. Let us put it in the contract. But you say "Oh, no, you don't want to do that." You want to give something away which is not yours, but which belongs to your children.

Mr. SILVER. But, Mr. Chairman, my testimony shows that we are preserving in this method of development the rights of the development of our great natural resources for the enjoyment of all the people.

The CHAIRMAN. Then God pity the people who are to follow—the descendants of the farmers that you represent now, from the way you map it out.

Senator HEFLIN. Mr. Chairman, the farmers are more interested in the fertilizers than anything else, and Mr. Ford offers to make fertilizers, and says he will not charge over 8 per cent over the cost of production. That means a great deal to the farmers of the country, and if he did not make anything else but that, that is all they are interested in, and if he does make anything else, that is all they are interested in now, because they do not know what else he is going to make; but they do feel justified in endorsing his proposal when he does agree to make fertilizers at a profit of not more than 8 per cent. That is the way they feel about it. That is the way Mr. Silver feels.

The CHAIRMAN. In this you have the fertilizer, and you fellows are honest in what you are trying to do here. You want that in because it is going to protect the farmer, on the agreement that he will not make more than 8 per cent. You are willing to do that with this sanctimonious corporation that you propose to have; but if it is good for fertilizer, then make it good for every kilowatt of electricity that is developed by those government dams and I remove my objection. Make it good all the way through, or do not put it in at all. If we will not make any regulation about the output of those dams and the electricity that is made from that water that belongs to the people of the United States, you are going to let Ford or his corporation make a 100 per cent out of it if they can, and then you say, when we object to that, "Why, it is Ford, and of course he would not do anything like that; he has a reputation; Ford has done great things," and then to show your own good faith, apparently, you say, "We will limit the fertilizer proposition to 8 per cent." Why stop at fertilizer? Everybody knows that unless some big improvement is made in the development of fertilizer, he never will make 8 per cent on the fertilizer proposition, and all of this monkey business about it from the various farmers' organizations won't amount to a snap of the finger.

Senator NORBECK. We had some testimony here that this large corporation that is manufacturing cyanamid has never paid a dividend on its common stock; that they have paid 6 per cent on their preferred stock, but they have missed some dividends, and at the present time are practically idle, because they are unable to make 6 per cent at Niagara Falls.

Mr. SILVER. I wonder if that is not accounted for by the fact of the high price at which they sell their goods, and that at the present time the farmer is so prostrate financially that he is unable to pay the price? If they operated on the basis we urge they would run and serve the people and earn dividends.

Senator NORBECK. But any corporation would prefer to sell its product at a low price rather than lie idle. A low price will permit the farmer to purchase to some extent.

Mr. SILVER. I think so, but they are on the old basis.

Senator NORBECK. But there is an efficient business organization that can not get its costs low enough to permit it to manufacture.

Senator HEFLIN. But Dr. Whitney testified the other day on the subject of fertilizer, and he said in 1920 the supply was nearly 8,000,000 tons and in 1921 it was just about 4,000,000 tons.

Senator NORBECK. Yes; and they did not buy all of that.

Mr. SILVER. And the other fellow did not make a profit and could not buy the goods. Here is a proposal to reduce cost factors.

Senator NORBECK. Here is a proposal to give them 8 per cent when the other fellow is working on a 6 per cent basis and they can not go ahead.

Mr. SILVER. It does not guarantee him 8 per cent or any other amount; only limits the earnings to that.

The CHAIRMAN. Let us strike that out of the contract and say to Mr. Ford: "We do not want to put that in about limiting you to 8 per cent, because we have confidence in you and have faith in you." Just because it is Ford you will not have a limitation in it. It does not amount to anything anyway except as a talking point. That is all it is there for. If it is in there in good faith, then put it all through the contract and make it apply to everything. If you do that, you have removed 90 per cent of the objection to this kind of a proposition.

Mr. BOWER. Of course, there is this difference, that on the fertilizer end of it you have a plant that you built under a section of the national defense act.

Mr. CHAIRMAN. Yes.

Mr. BOWER. And you built that plant to make fertilizer.

Senator NORBECK. Are you referring to plant 1 or 2?

Mr. BOWER. No. 2 principally. Just considering that phase of it in the Muscle Shoals development, there is water power, and there is a fertilizer plant. Mr. Ford proposes to relieve the Government of what a great many people have called a white elephant, a burden on the Government's hands, and he will take the fertilizer plant as well as the power. You have not a harrow factory or a plow factory down there, or a steel factory or a glass factory. If those things are built down there, Mr. Ford is going to build them.

Senator NORBECK. Now, why should we give him more current than he needs for the fertilizer if he is not going to build these other things?

Mr. BOWER. Well, my point is this, that at the fertilizer factory which you have built and which he takes over and agrees to operate he limits his profits because that has been built there and is furnished to him at a low price, as in the contract; but there is no glass factory there.

The CHAIRMAN. Suppose he puts up a glass factory, just as the Senator says. If we can regulate the price that he makes out of fertilizer because we build the fertilizer plant, why can we not regulate anything that is using water that belongs to us and that has been developed on money that the taxpayers of the United States have had to pay? Why not regulate the price right through?

Mr. BOWER. I don't exactly see how you would do it. We don't know what his products are going to be.

The CHAIRMAN. We could do it under Ford's offer. There is no doubt about it. We could do it, whatever it was.

Mr. SILVER. What would you regulate the price on, Senator?

The CHAIRMAN. On anything. In my bill you will find it is provided for that anything that is developed in the way of water power there shall be regulated by public authorities and not be given to one man or one corporation to the exclusion of everybody else, without any regulation as to the price, but absolutely free.

Senator NORBECK. I think Ford has carried you plumb off your feet. I think he has done wonderful, Ford has, and I think that is very good, but I would rather we would arrive at a workable contract.

Mr. SILVER. Here is a tender that sets out certain things. He make tender for so much money and certain other things, and among those other things he is going to do in purchase of the Government property is that he will keep it ready for the Government, and, in the meantime, he will manufacture under certain conditions. That is Mr. Ford's tender. That has no relationship to other things that would be done under the contract.

Senator NORBECK. Why should we give Ford other water power for other purposes? Don't we give him enough when we give him the factory? Why should we go on and give him some more property?

Mr. SILVER. I can not speak for Mr. Ford.

The CHAIRMAN. There has not been anybody here that can. They are all for Ford, but nobody can speak for him.

Mr. SILVER. But would Mr. Ford be interested in the fertilizer end without the other?

Senator NORBECK. Hope springs eternal in your breast, but it will get you a lot of grief if you live a while.

The CHAIRMAN. I would like to take Mr. Bower's proposition that he made a while ago. He said the reason why we could regulate the cost of fertilizer and not the other things is because the other things would be Ford's when he built them; but Mr. Bower forgets in that proposition that from the very beginning the Government loses title to nitrate plant No. 2 and all that property. Mr. Ford buys it.

Mr. BOWER. He buys it at a price that justifies regulation.

The CHAIRMAN. He buys it at a price that justifies regulation? Why, he pays \$5,000,000 for property that cost about \$100,000,000. Why, there is more than \$5,000,000 in value, if you would take the scrap value of everything that he buys, and it would be cheap indeed at \$15,000,000.

Mr. BOWER. Would that justify the regulation?

The CHAIRMAN. He gets it so cheap.

Mr. SILVER. That is the point.

The CHAIRMAN. He gets the other cheaper still. He does not pay \$5,000,000 for the water power.

Senator NORBECK. Mr. Silver, on what does Ford get 8 per cent?

Mr. SILVER. On the manufacture of the fertilizer.

Senator NORBECK. How do you compute your costs?

Mr. SILVER. That is what is set up by the tender for this board to do. Here are seven farmers of nine on the board. Whatever they will take into consideration.

Senator NORBECK. I mean how do you compute his manufacturing cost and his investment?

Mr. SILVER. Of course the greater the investment the greater would be the interest charge. The capital invested would be one of the items to be considered.

Senator NORBECK. What is your basis for figuring that?

Mr. SILVER. And the higher the sale price would be, the higher the manufactured product would be, so far as the product goes under this contract.

The CHAIRMAN. He has made that perfectly plain, has he not, Senator Norbeck, on what the 8 per cent is going to be based? Don't you understand that now?

Senator NORBECK. No.

The CHAIRMAN. Well, that is funny. Anybody who will read that record will wonder why you do not understand that after that explanation.

Senator HEFLIN. I don't think you let him get through.

The CHAIRMAN. Oh, yes; he was through.

Mr. SILVER. There is no doubt in my mind that when this committee is set up, and with the broad authorization contained in the tender they will see that the public interest is properly protected.

Senator NORBECK. As the contract permits them.

Mr. SILVER. Yes; under the authorization they have. Is not that authorization a reasonably wide one and full?

Senator NORBECK. What does the contract say the 8 per cent shall be computed on.

Mr. BOWER. Fair actual annual cost of production.

Senator NORBECK. What do you figure the investment? What is your basis of figuring on that? Where do you start in? Where do you get your investment figures?

Mr. BOWER. That would be what he paid for the nitrate plant.

Mr. SILVER. That is one the items.

Senator NORBECK. What is the relation of the one plant to the other one under this contract—

The CHAIRMAN. Or to the railroad?

Senator NORBECK. Or to the railroad.

The CHAIRMAN. Or to Gorgas?

Senator NORBECK. What does he actually pay for the nitrate plant, and what does he pay for the other property? Where would you get the actual investment charges?

Mr. BROWER. It seems to me that under the contract that would be up to this board.

Senator NORBECK. Now, we want you to point that out in the contract. I have been unable to find it. If you will find it you will help the committee very much.

Mr. BOWER. Certainly what the capital charge would be would be one of the factors of the cost, would it not? You will agree with that, Senator Norris. Then the board shall determine what has been the cost to manufacture. To determine what has been the cost, the board would have to determine what is the capital charge.

Senator NORBECK. What is Ford paying \$5,000,000 for? Is it for the nitrate plant or is it for the railroad?

Mr. BOWER. It is for the whole thing. That would have to be adjudicated by the board.

Senator NORBECK. Is there anything in there that authorized the board to adjudicate that point?

Mr. BOWER. I think so.

Senator NORBECK. What is it?

Mr. BOWER. "The board shall determine what has been the cost of manufacture."

Senator NORBECK. But the cost of manufacture, yes. Is there room for two opinions on that?

Mr. BOWER. Don't you think that the capital charge is part of the cost of manufacture?

Senator NORBECK. Certainly, but what is the capital charge. What is the capital charge on this thing?

Mr. BOWER. Then don't you think in determining cost of manufacture the board would have to determine the capital charge?

Senator NORBECK. It would be \$10,000,000 less than nothing, according to the chairman's statement, that Mr. Ford would be getting \$15,000,000 worth of property for \$5,000,000.

Mr. BOWER. It is not a question of what the property is worth; it is a question of what Mr. Ford paid for it. That would be his capital charge, and in case of dispute, if the board and Mr. Ford can not agree as to what is a proper capital cost to charge on this cost of manufacture; it goes to the Federal Trade Commission for decision.

Senator NORBECK. Do you really feel that, now—Mr. Ford is a good man and he has done splendid things, and I don't hold it against him that he charges \$600 for an automobile that costs him \$130 to build. I don't hold that against him, but if somebody else did that we would raise Cain.

Senator HEFLIN. Others charge \$3,000 for them that don't cost \$300.

Senator NORBECK. But will that good spirit continue for a century after the man has left this earth?

The CHAIRMAN. Sure it will. This corporation is going to have a soul.

Mr. SILVER. The confusion of the individual with the principle of developing a natural resource, of course, is interesting, if no more.

Senator NORBECK. What is that?

Mr. SILVER. The confusing of the individual with the development of a natural resource on a new method is interesting.

Senator NORBECK. If Ford was going to do what Senator Heflin thinks he is going to do; if I knew that, it would simplify the matter a great deal with me, but why

should not Ford like any other business man say what he is going to do and have it put in the contract. If he sells me an automobile he gives me a contract. If I take an agency he gives me a contract. He doesn't say, "You give me \$10,000 and I will sell you some cars."

Senator HEFLIN. He sets the whole thing out here in a contract, to manufacture fertilizer at 8 per cent profit.

The CHAIRMAN. I will tell you another thing he does too, Senator. If you are an agent and you buy cars you pay cash.

Senator NORBECK. He applies business methods.

The CHAIRMAN. Sure he does. There are just two difficulties. One is, as Senator Norbeck says, he does business on business methods, and he will apply business methods to us when he gets this contract, and the other is that there is grave doubt about his living a hundred years.

Senator HEFLIN. The farmer is a business man and he feels like his business will be greatly benefited by Ford getting this proposition and manufacturing fertilizers.

Senator NORBECK. I don't think the farmers have gone as far as you do. There was not a single one of them that said, "Shut your eyes and take Ford's contract." Those resolutions were qualified and they were carefully drawn. I think your position is different from these resolutions that you presented to start with. I think you have gone further. I think the farmer out in the country who wrote that stuff wrote it guardedly, but I think you are wanting us to "Shut your eyes and sign."

Mr. SILVER. Read those resolutions in connection with my testimony, and if you are still of that opinion I would like to discuss it with you.

Senator NORBECK. I am sure that a number of those you put in the record do not go as far as you do. I am sure of that.

Senator HEFLIN. Would you not like to discuss them with him before a convention of farmers?

Mr. SILVER. They would do the discussing, I would not.

Senator NORBECK. I would ask you six questions before the convention of farmers, and you would be explaining all the rest of the afternoon and all the evening.

Mr. SILVER. I am not a bit uneasy about the questions you would ask the farmers' conventions. They would answer them all right, but how would you answer their question, for they will have questions for somebody when this matter fails.

Senator HEFLIN. They would be asking who sent him out there, wouldn't they?

Mr. SILVER. They would attend to him all right.

Senator NORBECK. I always found the farmer a pretty hard-headed fellow. I give them credit for being able to take care of their own row.

Mr. SILVER. Shall I continue, Mr. Chairman?

The CHAIRMAN. Yes.

Mr. SILVER. Said board to determine cost and allowed to regulate price, to limit profit to 8 per cent as above, shall have access to books and determine territorial distribution and regulate sale to farmers, their agencies, or organization.

Paragraph 17 gives the Government full right in time of war to use plant and personnel of the company to manufacture explosives with reasonable compensation. Gives Government free access to plant at all times for confidential study and inspection.

18. At end of lease, should Government elect not to operate, the company shall have preferred right to negotiate a new lease on terms as may then be prescribed by Congress.

Paragraph 19 provides method of action in case of violation of any of the terms of the contract.

20. Submitted in whole and not in part and upon acceptance binding upon the United States and upon Mr. Ford, his heirs, representatives, and assigns and upon the company, its successors and assigns. Contracts, leases, deeds, and other instruments to be duly executed and delivered.

In talking about less cost factors and the joking that has been done about the situation which might exist, I would like to read into the record just one illustration of what has taken place.

Reading from the record of the company, that would cause me to believe that certainly this does not make the situation any worse, and there is a very strong belief in my mind and many others, that it will be a very much better situation. I refer to a memorandum taken from a book by J. H. Bridge in connection with the organization of the United States Steel Co.

On March 1, 1900, the balance sheet of the Carnegie Steel Co. showed a capital investment of \$25,000,000 with a surplus of \$56,579,914.19, and a total assets of \$101,416,902.43. But the actual capital invested was only \$25,000,000.

The CHAIRMAN. Now, what was the total?

Mr. SILVER. The total assets, or capital? The total capital was \$25,000,000.

The CHAIRMAN. The total assets?

Mr. SILVER. One hundred and one million and some odd dollars.

The CHAIRMAN. All right.

Mr. SILVER. That was on March 1, 1900.

On March 30, 1900, the same year and same month, the Carnegie Steel Co. declared a final dividend of 88 per cent, or \$22,000,000, which was used to secure control of H. C. Frick Coke Co.

Following this organization the Carnegie Steel Co. was capitalized at \$320,000,000, of which \$160,000,000 were bonds and \$160,000,000 was stock. All grown from the \$25,000,000 of the original Carnegie Co.

When the Carnegie Co. went into the United States Steel Co. this \$320,000,000 of capital bearing interest became \$492,556,160, as follows:

One hundred and sixty million dollars of Carnegie bonds became \$160,000,000 of United States Steel bonds.

Ninety-six million dollars of Carnegie stock became \$144,000,000 of United States Steel bonds. That stock went into bonds in United States Steel.

Then \$64,000,000 of Carnegie stock became \$98,277,120 of preferred stock of the United States Steel, plus \$90,279,040 of United States Steel common stock. That was \$188,556,160, all in one year's time. Within about a year's time that \$25,000,000 of capital builded from the Carnegie Co. into the United States Steel into \$492,556,160.

Senator NORBECK. The one redeeming feature was that Carnegie gave the money back to the public, didn't he?

Mr. SILVER. I am going to read about the income feature of it to show where the money came from that went back to the public, in just a minute.

On June 12, 1919, the United States Steel Corporation has outstanding \$413,010,000 bonds, \$360,281,100 of 7 per cent preferred stock, and \$508,302,500 of common stock. Now, this common stock was water pure and simple, and a part of that preferred stock.

Now, I will read, just treating with the preferred stock, and that was partly watered, and the common stock, which was all watered, with the earnings on that, which answers your question, Senator Norbeck.

Through the pool methods and Pittsburgh plus and so forth, in 1909 they earned \$21.94 on the preferred and \$10.59 on the common.

In 1909 and 1910 they earned \$24.26 on the preferred stock and \$12.23 on the common.

In 1911 they earned \$15.35 on the preferred and \$5.92 on the common.

In 1912 they earned \$15.05 on the preferred and \$5.71 on the common.

In 1913 they earned \$22.05 on the preferred and \$11.05 on the common.

In 1914 it was \$6.52 on the preferred and nothing on the common.

In 1915 it was \$21.05 on the preferred and \$9.96 on the common.

In 1916 it was \$75.37 on the preferred and \$48.46 on the common.

In 1917 it was \$62.23 on the preferred and \$39.15 on the common.

In 1918 they earned \$38.17 on the preferred and \$22.01 on the common.

The last couple of years I did not have. Mr. Chairman, but I would be glad to insert them in the record, as I think I can have them shortly.

The CHAIRMAN. All right.

Mr. SILVER. Which illustrates, by the methods which they used, that the public is victimized. How much distress those millions or hundreds of millions of dollars unfairly wrung from the people caused.

The CHAIRMAN. Exactly. Now, in order to prevent that I am insisting that we should put something in the contract that the Ford corporation can not do that, and you are saying "No, no; that is not necessary because the people will regulate that." Now, we haven't regulated the steel very well, to prevent that, have we, and do you think we will do any better with the Ford Corporation.

Mr. SILVER. I believe that the public conscience and public interest in these things is regulating business to-day as it never did before, and at the same time if this tender is accepted develop a competition in this business which the public badly needs at this time.

The CHAIRMAN. You have just been demonstrating the way we regulate now the enormous profits that you have shown from the Steel Company there, on most of it water. It is an outrageous thing.

Mr. SILVER. I am illustrating what is going on and ought to be stopped and supporting a plan that will cut the cost of producing steel one-half and at the same time cut the cost of fertilizer to one-half cost.

The CHAIRMAN. You propose to stop it by refusing to put anything in this contract so as to let future generations regulate it like you are regulating it now, and what we want to do, who want to protect the people, and particularly the farmers, is to put something in the contract that will enable us to regulate these enormous

profits that this corporation is going to make, so that some future representative of the Farmers' Union—for you will be dead—won't be able to come here and say on account of what was shoved through Congress by Members of Congress who did not attend to their business, urged on by Silver, the representative of the farmers, this Ford corporation ran along for a few years and then Ford died, and this year they made 100 per cent on the common and 200 per cent on the preferred, and next year 200 on the common and 300 on the preferred, just like you have been showing to-day. That is what will happen then unless now we will keep the title to this property in the Government and protect the people who own it by the contract, which you do not want us to do.

Mr. SILVER. It is hardly fair to put it that way, for everything I have said here I have said and put as I believe to be following out the instructions of the people who sent me here, and I have tried to carry out their wishes in the matter, and just so far as they wish to go it is my wish to go, and as far as I can justify with their thoughts and actions, their reason, and mine, in asking that this matter go in as a whole was to give the basis of their conclusions and the facts that they considered.

Now, to go a little further—

Senator HEFLIN. Before you leave that, Mr. Silver, you understood that the Government, in the first place, wanted to have a nitrate plant so that it could be free from dependence upon Chile and other foreign countries?

Mr. SILVER. Or anybody else; we would have it within our own borders and be in that matter self-contained.

Senator HEFLIN. Yes. Now, then, we have the nitrate plant built. Then the farmers said, "Why not use it to make fertilizers in time of peace?" Is not that true?

Mr. SILVER. Yes, sir; that is true.

Senator HEFLIN. They said they would like to have that done.

Mr. SILVER. That is true.

Senator HEFLIN. Then Mr. Ford comes along and says, "I will make fertilizers in time of peace, and I will make them at a reasonable price. I won't demand over 8 per cent profit."

Mr. SILVER. Yes.

Senator HEFLIN. Now, he agrees to do that with regard to fertilizer?

Mr. SILVER. Yes, sir.

Senator HEFLIN. Suppose he wants to spin cotton down there or to make automobiles or binders or reapers, or whatever the chairman said awhile ago; would it not be unfair to make him put in the contract what he would sell those products for, when he would be in competition with other people who would not be bound by the Government?

The CHAIRMAN. Why not the same with fertilizer?

Senator HEFLIN. He does not say what else he is going to do.

The CHAIRMAN. Why not make him say?

Senator HEFLIN. Why should he be required?

The CHAIRMAN. Why surrender this valuable heritage of the people to a man who won't tell what he will do with it?

Senator HEFLIN. He says he will manufacture fertilizer.

The CHAIRMAN. At least say, "No matter what you do, we will limit your profits to 8 per cent;" then we come somewhere near it. You would do that in a minute if Ford said that would be the right thing to do, and if Ford came here to-morrow and repudiated the 8 per cent on the fertilizer you would all denounce it.

Senator HEFLIN. Even if he would leave it out I would believe him and trust him to sell it cheaper than the fertilizer trust is selling it to-day.

The CHAIRMAN. So would I.

Senator HEFLIN. And the farmers would not be hurt any.

The CHAIRMAN. I would agree with you there, and I would agree to the same thing, and again we come back to the proposition, if you can guarantee he will live always—

Senator HEFLIN. He will live 15 or 20 years.

The CHAIRMAN. It will be ten years before this thing can be running right.

Senator HEFLIN. If we can get rid of the fertilizer trust in ten years, it will be worth all that you can do for Ford.

Mr. SILVER. May I just develop a thought without interruption? I ask that question frankly.

The CHAIRMAN. Certainly. You have the right to ask that, Mr. Silver, and the Chair will protect you and you need not be interrupted at all, and you can go on just as you want to.

Mr. SILVER. There is on the statutes of the country at this time a water power act. Under that water power act anybody may make and apply and, without saying any—

thing about what he is going to manufacture and do as long as he complies with the contract with the Government as to the construction and building of dams at private investment, and building those costs up which are high-cost factors, and result in issues of bonds, issues of stocks, and so forth, just as far as they will earn, or that they can make it earn, but then the proposition comes here that we will just ask the reverse of that and we will develop a water power under Governmental authorization which will provide, in addition to other things, that it be on the amortization plan, and that it will step down and make less cost factors throughout, so that the articles that may be manufactured will have a less cost factor, and can be sold to the farmers cheaper, and in addition to what may be manufactured or produced there, that it will set a new method of development that will make it possible, when other water powers are developed along that line, to carry electricity to our homes, that we may scrub our floors, wash our clothing, take our cattle to water by pumping water to them, do the hundred and one things that can be done by this electricity.

Electricity can be made a cheap raw material to take the drudgery out of farm life, and in addition to that, under this cheap current we can operate our railways and make the cheapest freights we ever had, for under the operation of railroads by electricity it has been shown that the cars, at least freight cars, can be moved—to illustrate, on the Chicago, Milwaukee & St. Paul, with the electrified part, some seven or eight hundred miles, the electric engine pulls the same train 14 miles a day that steam pulls 7. In that way it economizes so that the freight cars will do, barring the time they may be stopped, twice the service. It cuts down the investment in this equipment, makes a greater service on that rolling stock, a greater service of the roadbed, and 25 per cent of the cars that are used on the road carry coal for the road. It would free that 25 per cent, plus the fact that you will move them twice as fast, which means 50 per cent, or, in other words, that one car then will do the work of four as now operated, so there would be a great saving in investment in rolling stock, sufficiently great in many instances that it would provide the necessary funds, instead of building new rolling stock, to develop the water power that they might be electrically operated, all of which would result in the possibility of cheaper freights, which is one of the most desirable things in our national life at this time.

I would like to quote from the superpower survey:

"ADVANTAGES OF RAILROAD ELECTRIFICATION.

"Unified operation by electricity, on the other hand, would give much better conditions than any that could possibly be attained under unified operation by steam. There would be a new motive power, in which all units or parts designed for similar service would be identical and interchangeable. There would be pooling of all power, with great reduction of reserves. Repair shops would be consolidated and all maintenance would become a standardized manufacturing job. Track capacity would be greatly increased and certain tracks would be allocated to freight or passenger service exclusively. All the freight trains would be run on schedule; the average speed would be more nearly the same and would be increased at least to the 12.5 miles an hour needed to avoid the present punitive overtime payments. Engine-house facilities would be much simplified by consolidation.

"The reserves of men and of machinery required for joint operation will be much less than the aggregate of the separate reserves required for individual operation. The great waste involved in the maintenance of separate reserves of motive power is exhibited by the operating statistics of the roads, quoted elsewhere, which show that the average freight locomotive in this territory is in productive service only 3,250 hours out of the 8,760 hours in a year, and the average passenger locomotive only 2,630 hours. With joint electric operation and consequent unification of types of motive power there would be a striking improvement. The steam locomotive runs 8 hours a day; the electric locomotive 20 hours.

"Some of the advantages of electric operation are the conservation of national resources, both of coal and labor; an increase in the capacity of main and yard tracks; an improvement of the physical condition of terminals and an increase in the value of the property, as shown by the New York Central and Pennsylvania terminals in New York City; benefits both to the traveling public and to residents along the route through the elimination of noise and smoke; the possibility of providing multiple-level terminals and freight warehouses; and economy in operation through the use of fuel and machinery for generating energy by a few skillful operators in economical stations as contrasted with a large number of technically ignorant operators with small, uneconomical machines.

"The electric locomotive is equipped with meters that afford complete knowledge and control of operating conditions and that are also a valuable guide in handling the

train, particularly in starting a long, heavy train. With electric traction the economy of the entire sequence of operation is not dependent upon one man, as it is with steam. Operation is therefore no longer a matter of individual human judgment, skill or fidelity. It is this unfortunate human element that nullifies the theoretical advantages of the 'full-jeweled movement' steam locomotive. The effectiveness of the devices for increasing efficiency and capacity, such as brick arches, superheaters, stokers, siphons, automatic fire doors and power reverses, necessarily depends on the intelligence and faithfulness of the average engineer, and in consequence the average results are low. The inherent wastefulness of the steam locomotive is proved by its own advocates in their claim that '40 per cent of its coal can be saved by the careful use of these auxiliary devices.' Then why be skeptical of a saving of 60 per cent by a modern power station, which has all these devices in greater completeness and in addition, has brains to use them?

"The speed of different classes of trains will be more nearly uniform. Much heavier trains can be handled, and at the same time light freight trains can be moved at the speed of local passenger trains. It has been proved that for the heaviest freight service, such as mountain grade work, the electric locomotive is superior to the steam locomotive, but its superiority in handling light freight at high speed is not so generally understood.

"As the electric locomotive is simple and as all locomotives of a given class are identical and no more skill is required to operate them than is demanded of an ordinary chauffeur, all locomotives will be pooled, so that the total number required will be materially reduced.

"The flexibility of the electric locomotive is much greater than that of the steam locomotive. Its capacity is determined by heating and therefore by the average work it has to do, and not by the maximum grade, which is taken care of by the overload capacity of the engine. With electric traction the maximum grade for the profiles within the superpower zone is practically eliminated as the determining factor in locomotive equipment.

"The availability of the electric locomotive for service is at least twice as great as that of the steam locomotive. After a trip it can be thoroughly inspected in less than an hour, whereas the thorough inspection of a heavy steam locomotive consumes 4 to 10 hours. It requires no water, fuel stations, ashpits, or turntables. The repair shop capacity requires less than a third of that needed for steam locomotives. The expense of track maintenance is reduced and the ballast is cleaner. The engine-house expense is reduced nearly to a negligible amount. In the electric locomotive energy can be re-generated where the profile permits it, thus saving some energy and much wear and brake shoes, bettering the handling of trains and consequently saving expense in freight-car maintenance.

"As a result of these and other advantages the electric locomotive should, under favorable conditions, handle twice as many ton-miles as the steam locomotive per locomotive year. On the Norfolk & Western it actually handles three times as many ton-miles. This gain is not possible under all conditions; but it is possible where the traffic is great and the tracks, yards, and terminals are congested, as they are in the superpower zone.

"Electric traction, then, gives increased capacity of main track, yard track, and locomotives with reduced cost of operation and maintenance per ton-mile and per passenger mile." (Extract from report of Chief Engineer W. S. Murray on the superpower survey.)

The CHAIRMAN. Now, are you ready to be interrupted?

Mr. SILVER. All right, sir.

The CHAIRMAN. Now, Mr. Silver, did it ever occur to you that that was a mighty good argument against the acceptance of the Ford proposition here, that you have just made?

Mr. SILVER. I made the statement of fact and belief for whatever interpretation you seek to put on it, but to my mind supporting the acceptance of the Ford tender.

The CHAIRMAN. I want to put my interpretation on it now. I agree in what you have said. I want to see all this development.

Senator NORBECK. That is what the chairman is trying to do under his bill.

The CHAIRMAN. You bet; that is what I am trying to do, and I want to do that with every stream in the United States. You have said it very beautifully, and I want to show you why if we do what you want us to do it never can be brought about. In the first place, you started out by referring to the general dam act, which limits everything to 50 years. I don't think the Government is sufficiently protected in that act. Here you are asking for 100 years, which is a mighty big difference.

You wanted to wash your clothes as one of the things. Future generations will say, "Why can't we have this electricity to do our washing at our homes?" And they will

say, "Why, Congress gave it away. They gave it to a private corporation, or to Henry Ford." If we do the same with other streams as you want us to do with this, with Mr. Ford or any other interest, you would not have this electricity with which to wash your clothes and pump your water, and this transportation that you describe so magnificently can not be done at Muscle Shoals if we accept this contract. You can not wash your clothes with any of the electricity developed at Muscle Shoals if we accept this contract. We can not do a single one of the things you have enumerated if we do what you want us to do. We can not use this Muscle Shoals power for any of those things if we do what you want us to do.

Mr. SILVER. Mr. Chairman, just there you indicate the weak spot in your viewpoint; what I believe is the weak point, and that is this: The development of Muscle Shoals is only one small part of the water development in this country, and we realize that we can not wash our clothes, we can not sweep our floors, we can not pump our water, we can not cut our ice, and so on, with the electricity developed at Muscle Shoals; but if we develop Muscle Shoals on this amortization plan we will set in motion the method of development that will make a cheap raw material of electricity and make it cheap enough in the development of other water powers that we can have a cheap enough basis that we will be enabled to buy it with cheap priced commodities.

The CHAIRMAN. In other words, you want to use this as a precedent?

Mr. SILVER. Yes, sir.

The CHAIRMAN. And that is one of the reasons I am against it, because it is a bad one. That means that we would do over again whenever we got the opportunity just what we are doing to-day at Muscle Shoals. That is what a precedent means. The next man that comes along you will investigate far enough to find he is a good Christian man, moved by the very best of motives, and he is 60 years old, with chances that he will live 10 years, which will be 5 years after the development is completed, and you will give to him the Yellowstone, and you will give to another man who will show he is a good Methodist and square with all his neighbors the development of the Columbia River, which has got more power than this has, and you let out all the streams clear around, and in no instance will you make any provisions for the control of the sale of the electricity that is developed. Now, that is what you want us to do here, and if we follow that plan out all over the country, God save the people that must come after us. The corporations will own it all, will have all of it, without any exception. That is just what you are asking us to do.

Mr. SILVER. It is unfair to read into my mouth language which I have not used nor principles to which I do not subscribe.

The CHAIRMAN. I don't want to do that, Mr. Silver.

Mr. SILVER. I have said all the time that I have confidence in our institutions and in our people; that they will have proper control of our national activities, and for 15 years I have fought to preserve to the peoples' use the water powers of my home State, as I am doing here.

The CHAIRMAN. Oh, yes; put that in. I have not denied that.

Mr. BOWER. And if power is sold it is regulated.

The CHAIRMAN. No; you don't regulate this. You said that we can develop the whole country, and this is the way to develop it, like we are going at it here now. I think that is a fair statement of what you said. That is what I am afraid of; that this is going to be used as a precedent for every unconscionable corporation that will ever come along in the future, and if we are going to develop the water resources of the country on this basis we will not have preserved a single right of the people to control the price of electricity, and you can not wash your clothes nor scrub your floors nor run your trains nor pump your water, nor do anything else unless you pay tribute and pay the price to the corporation that has control.

Mr. SILVER. Senator, you do regulate further under this tender than the power under the general dam act, and, besides, it has the same State control as the same kind of business under the general dam act.

The CHAIRMAN. As I said, there are a lot of things in the general dam act that I do not like, but under the general dam act, my dear friends, the man who develops it, the lessee, is subject to the control of the State, if there is such a regulation in the State where it exists, in the sale of the power, and if not, then he is controlled by the Federal commission. In this case it is admitted, to begin with, that there is going to be none sold, and admitted, to begin with, that the Alabama commission will not have any authority whatever over Mr. Ford or any of the electricity that he generates, if he does not sell it, and he is not going to sell it.

Mr. BOWER. I notice in reading this section of your bill that your regulation is a regulation of the resale of power.

The CHAIRMAN. Yes, sir.

Mr. BOWER. You don't propose to regulate what any of these purchasers of this power shall make?

The CHAIRMAN. No, sir; they can make anything they want to.

Mr. BOWER. Then you won't regulate it?

The CHAIRMAN. Not what they make, but I regulate the price that they will have to pay.

Mr. BOWER. You are regulating the price that the buyer of power will have to pay?

The CHAIRMAN. I am not in favor of a law that would say that you shall do this or that or any other thing. I do say as between an individual or a corporation and a municipality, where the public want it, the municipality shall be the favored bidder. They shall give it to them in preference to the private party.

Mr. BOWER. I got a wrong interpretation from your statement, that if this power was sold under your bill you did regulate the things that were made by that power.

The CHAIRMAN. No.

Mr. BOWER. Then that is the same as the Ford proposal.

The CHAIRMAN. Oh, no; it is not. Ford does not sell any. He is going to keep it himself.

Mr. BOWER. But the people you sell this power to won't sell any power.

The CHAIRMAN. But the corporation that handles it is a corporation owned by the Government of the United States. I am not objecting to a monopoly if the Government owns it, but I don't want a monopoly that is privately owned.

Mr. BOWER. And they sell this power to a manufacturing concern to do it cheaply.

The CHAIRMAN. And they provide the amount of profit in it, what the resale price shall be.

Mr. BOWER. Of power.

The CHAIRMAN. Yes.

Mr. BOWER. Not on what they manufacture.

The CHAIRMAN. All right—the power. If you say in here that Ford's corporation shall pay a certain price for this power, if he gets it, in competition with others, and make him sell the power to municipalities and cities and to counties and public organizations of that kind, and let it be regulated by the Alabama authorities, then it is relieved of its objectionable features. You have not taken away, of course, what to my mind is an insuperable objection, and every conservationist that I have ever believed in, that was not in favor of turning over the resources of the country to private manipulators, was opposed to a hundred-year contract with anybody. That is pretty near perpetual. There have been others issued, I admit, some of them that are perpetual.

Mr. SILVER. There are perpetual leases. The Tennessee River development of the aluminum company's. They are perpetual.

The CHAIRMAN. They did not get that from Congress. I do not have the blood of that on me.

Mr. SILVER. If you are requiring all that to be sold to municipalities, as you mention there, it would certainly bar the country people from getting the benefit of cheaper manufactured goods.

The CHAIRMAN. I don't regulate the use of all of it, but they would have preference. My own idea would be if we have a great dam right here at Washington, before we would permit that electricity to be used by Mr. Ford to make automobiles, it ought to be given to the people to light their homes, to cook their meals, to run their washing machines, at the lowest possible price. That comes nearer giving it to everybody, because if you give it to one man to manufacture with, and he is in competition with a man who does not have that power, all he does is to just cut under the other fellow enough to sell his product, and he makes a big profit himself.

Mr. SILVER. If there is to be no more developed, but the survey shows there is an abundance in the United States for all purposes for centuries to come if all industry were electrified.

The CHAIRMAN. It will not come in the next thousand years, probably. I hope it comes a lot faster than it has been coming, but if you have followed the fight that I have been trying to make to get Great Falls developed, right in the sight of the Dome of the Capitol, and see how it stays there undeveloped—

Mr. SILVER. Those falls ought to be developed.

Mr. BOWER. Is not that a justification of our offer on this proposition? We tried. Senator Norris, as you know, Government operation on this other proposition, and we could not get consideration of the House. They would not give us a hearing before the committee of the House on that bill. It lay there for three months, and they would not grant us a hearing.

The CHAIRMAN. That bill, in my judgment, was not anywhere as near as good as this bill, because it still left it in politics. It turned it over to the Secretary of War, a corporation organized by him. It would have been changed every time the administration was changed. But I agree that you did not get anywhere with it, and I did everything I could to have you get somewhere.

Mr. BOWER. I know you did, Senator, and we appreciated that very much.

The CHAIRMAN. I would rather do that than nothing. I think we made a serious blunder when we quit work down there at Muscle Shoals. We ought to have kept on. I am afraid when I read in the paper of some cloudburst or something, that something of that sort will come along and tear away all our work that is worth millions, and we ought not to lose a minute in getting to work there.

Mr. BOWER. Frankly, I would say that I do not see any hope whatever in the House now.

The CHAIRMAN. On conservation of natural resources I have been active all my life. I voted against the water power act because I did not think it protected our rights enough.

Mr. BOWER. I don't think there is any question but what that is one of the controlling factors in the farmers' advocating the Ford proposal, because the farmers believe that is the only way they will secure this development and are not satisfied with development as proposed under the dam act.

The CHAIRMAN. I think you are right. I think the farmers are advocating the Ford proposal, and it is perfectly natural—

Mr. BOWER. They believe in Mr. Ford.

The CHAIRMAN. Because they believe in Mr. Ford.

Mr. BOWER. That is true.

The CHAIRMAN. I said on the floor of the Senate, while I was arguing the Great Falls proposition—and they turned me down on that—that the unseen power seemed to be always sufficient to defeat every proposition we had, but the time would come when the public sentiment would be so strong, it would go the other way and it would swing so far that these very fellows would be depending on me to help defend them from the mob. Well, that time has not come, but to some extent it has come, because the plea, almost to a man, is to give this to Mr. Ford, and the only thing they know about it is that they know Ford and they like him, and I know Ford and I like him, but I feel that I have a responsibility, when it is put up to me, to investigate it to find out what is in it that is unfair, and if I find it is unfair, turn it down if everybody is against me. I am convinced it is unfair to turn this valuable thing over to a corporation without any agreement for a hundred years.

Mr. BOWER. There is an agreement as to the fertilizer.

The CHAIRMAN. I ought not to interrupt you so much, but I am so damned full of this I can't keep still. I have been in this fight for too many years. I am all worked up about it. I have seen the people defeated so often, time and time again, and I think they are about to be horn-swoggled again.

Mr. SILVER. The people believe that this is an opportunity to develop a great natural resource so that they will benefit by it, and that they will be enabled to have much better things and much more enjoyment out of their natural resources than anything that has heretofore been developed or promised otherwise at this time.

The CHAIRMAN. Mr. Silver, I believe if your people, the farmers of this country, would stand by the proposition they laid down a year ago, when the committee investigated it under your organization, instead of changing around and now coming in for this 100-year corporation, and would stand together—and you are more influential with them than anybody, you are responsible more than anybody—if the farmers and your organization would all stand together, we could put this thing across now, because everybody that has looked back has realized that we have got to do something with it, and now is the time to get in our work here and do something that will benefit not only the present-day people, but the people that are going to follow, and not sign away their rights. That is what I don't like about the position you take. If you would unite your people, and we unite here, if you fellows were moved by honest motives that want to give something to Ford just because Ford is a good man, and would go with us who want to conserve the resources for future generations, and not give them away to any corporation, if you would do that, if you would be with us, you would get some legislation right away. If you will sit down and think and realize what we are going to give to this corporation in the way of natural resources that belong to our children, I can not conceive of you, as intelligent as you are, and as honest as you are down in your own heart, doing such a thing. You must know you are wrong.

Senator HEFLIN. Mr. Chairman, they realize that nothing has been done at Muscle Shoals, and they don't believe anything is going to be done now by the Government.

The CHAIRMAN. I know that, but let us convince them that the Government is going to do something. Let us go in there and do it.

Senator HEFLIN. But this is a proposition to do something now.

The CHAIRMAN. That is the trouble. We can not count on you.

Senator HEFLIN. Ford expects to go on through and do something with it, and everybody else who has attempted to do anything with it has failed.

Senator HARRELD. You think we are about like the girl whose lover quit her and she married a tramp in sheer despair.

The CHAIRMAN. It makes me think of the fellow defending the Standard Oil Co. He said, "Before the Standard Oil went into this business we paid 25 cents a gallon for kerosene." That is true. They have reduced it. Therefore, let them have their own way. Don't regulate them in any way at all. You say Ford made an automobile and he sold it to us cheaper than anybody else. But he made a big profit himself.

Mr. SILVER. I think he did, but owing to his business genius he gives us more for our money than anybody else.

Senator HEFLIN. That is true, but he was satisfied with a reasonable profit.

The CHAIRMAN. He ought to have been satisfied. He was making enough. He was not worth anything when he started in, and since we have been alive he has become one of the biggest millionaires in the world. He has made lots of money.

Senator HEFLIN. But all the other concerns charged more than he did.

The CHAIRMAN. You say because Ford sold his automobiles cheaper than the other fellows did and did not profiteer as much as the other fellows did, therefore, let us contribute for a hundred years this great inheritance to Mr. Ford, and let him give it away to a corporation.

Senator HEFLIN. That would be some inducement to a man who had been fair in his dealings with his fellows.

The CHAIRMAN. I admit that, all of it. I would rather give it to Ford than I would to the Standard Oil Co. If I could give it to Ford, I would rather expect Ford to do the square thing, but he can not live to carry it out. I am willing to enter into a contract now to give it to him without anything, turn it all over to him, let him operate it, let him make everything he can out of it, if he will operate this nitrate plant and sell it to the farmers and let that contract last as long as Ford lives. If you want to agree to a contract like that you can get me.

Senator HEFLIN. He would rather have it for a hundred years.

The CHAIRMAN. Well, I guess they would rather have it for a hundred years.

Mr. SILVER. Instead of, as you seem to see it, our people see a different picture of this thing, a true picture. Here are, estimating the ones that are home, some 6,000,000 and over farm homes, with the woman over the washtub once a week—it may be the mother or the daughter. There is the same number of homes with the boy or man driving the cattle to water in cold, bad weather, cutting ice in winter and doing other things, and all of those things that would be so helpful in country life and take the drudgery out of it, can be done by harnessing and delivering this electric power at a price that the sale of their product would enable them to buy. So when we secure the adoption of this tender and the resulting beneficent and helpful development they will call us blessed.

The CHAIRMAN. If you wanted to do that I would be with you, but here you are doing exactly the opposite thing, Mr. Silver. You are saying "Turn this over to Ford." What is the woman over the washtub going to say when she sees this development here? Why, "Mr. Ford, Mr. Silver said when you got this I was going to be relieved from washing. I was going to get a washing machine and run it by electricity." Mr. Ford says, "Oh, no; I am going to make automobiles with this power. I am not going to give it to you."

What about the boy driving the cattle to water. He will say to Ford, "Silver said when you got this I would have power to pump water with." Silver said I was going to get it after you got this." Ford says, "I am going to make steel with it, and make 25 per cent profit on this. I am not going to let you have this."

Mr. SILVER. Of course you confuse your government ownership picture with the simple project of the Muscle Shoals and with the great power development of this country on the amortization basis which is the method by which the country gets the benefit along with others.

The CHAIRMAN. But you say we want to use this as an example for the balance of the country. If you do, you are not ever going to reach the woman over the washtub, or the boy driving cattle to water.

Mr. SILVER. We are definitely urging one thing, namely, the fertilizer, which is one of the greatest costs on the farm, and we believe if we get the amortization feature established we will have passed a turning point in the development of natural resources that will enable us to reach these things I have mentioned, the less cost factors which will enable the children of the farms to be better educated and to wear better clothing and have more of the home comforts, all of which are so badly needed and so much to be desired, and anything that can be done to bring that about we are anxious to see that it is done.

(Whereupon at 5:40 o'clock p. m., the hearing was adjourned to 10 o'clock a m Wednesday, May 10, 1922.)

MUSCLE SHOALS.

WEDNESDAY, MAY 10, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met at 10.30 o'clock, pursuant to adjournment, in the hearing room of the Committee on Commerce, United States Senate, Capitol Building, Senator George W. Norris (presiding).

Present: Senators Norris (chairman), Capper, Keyes, Gooding, Ladd, Norbeck, McKinley, Kendrick, Harrison, Heflin, and Caraway.

The CHAIRMAN. The committee will come to order.

STATEMENT OF MR. R. F. BOWER, ASSISTANT IN WASHINGTON OFFICE OF AMERICAN FARM BUREAU FEDERATION.

Mr. BOWER. With your permission, Mr. Chairman, my name is R. F. Bower, assistant to Mr. Silver, of the American Farm Bureau Federation.

Mr. Silver, yesterday, covered the Ford proposal other than the sections dealing with fertilizer production, and I will attempt to address myself solely to that phase and what benefits the farmers believe can be secured.

There are three sections of the contract that deal with the fertilizer production.

In the first one of the three—

"The company agrees to operate nitrate plant No. 2 to the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other commercial fertilizers (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control, and further agrees:

"(a) To determine by research whether by means of electric-furnace methods and industrial chemistry there may be produced on a commercial scale fertilizer compounds of higher grade and at lower prices than fertilizer-using farmers have in the past been able to obtain, and to determine whether in a broad way the application of electricity and industrial chemistry may accomplish for the agricultural industry of the country what they have economically accomplished for other industries, and if so found and determined to reasonably employ such improved methods."

Then section 16 is the one (I won't take the time to read it in full) which provides for the board, a majority of which is chosen by the President and confirmed by the Senate from nominations made by the leading national farm organizations of the country.

That sixteenth paragraph is a very striking thing when you analyze it; and I will come to that later.

This is a question which we believe is broader in its fertilizer application than most people consider. It is a question as to whether we are going to be able to maintain our soil fertility and continue to produce the crops necessary to feed this country, or whether we have got to go on in the future as we have in the past and exhaust our soils in order to produce crops; and under such a system we see inevitably a time when we can not meet the demand that is upon us. Our whole national prosperity depends upon the maintenance of our soil fertility. No country has ever continued in the history of the world longer than the time when its soil fertility has been exhausted. We have illustrations of the great nations of Babylonia and Assyria, nations which supported millions of population, sending armies over to attack Rome, and over into India, and down into Egypt, where today there is a desert waste, and where plants will not grow.

Senator NORBECK. It is not pertinent here, but of course you are willing to admit there are a great many causes that enter into that predicament.

Mr. BOWER. There are other causes that enter into it.

Senator NORBECK. Some writers have gone so far as to say that there has actually been a climatic change in that country, and less rainfall.

Mr. BOWER. A good many scientists agree with that.

The CHAIRMAN. There is not rainfall enough there to produce a crop. I think that is admitted.

Mr. BOWER. That is true, but you must remember that the decrease of vegetation has a tremendous effect on the rainfall, and we are finding that out in these great areas where we irrigate in this country.

Senator NORBECK. Now you are getting into a most controversial point. If you can find by Government records anywhere that there has been any increase in rainfall by anything man has ever done, I want to buy you a new hat, because that is a thing I have been looking into for a great many years.

Mr. BOWER. I understand that it is a controversial question, but some scientists have taken the position that once you start crops it does have a bearing on the amount of rainfall. But that does not enter into this question at all.

It is the duty of the farmer to raise as large crops from his land as he possibly can do, but if he does that at the expense of soil fertility he is jeopardizing future production and, consequently, jeopardizing future generations.

In the Outlook of October 12, 1912, Theodore Roosevelt said:

"I have always been deeply impressed with Liebig's statement that it was the decrease of soil fertility and not either peace or war which was fundamental in bringing about the decadence of nations. While unquestionably nations have been destroyed by other causes, I have become convinced that it was the destruction of the soil itself which was perhaps the most fatal of all causes."

There has been a great deal of talk about soil fertility, and a lot of people make out that it is a hard problem, but in a way it is a simple problem.

The elements in any normal agricultural soil that are ever lacking are only three: nitrogen, phosphorous, and potash; and the only way to maintain soil fertility is to replace into that soil corresponding amounts of the elements you are taking out in crops.

Now, it is just simple arithmetic, an addition by fertilizer, legumes, manures, or some other method, and subtraction by growing crops.

The difficulty with commercial fertilizers, which I will discuss a little more fully when I get to it, has been the low grade material and the high prices charged for it. It is not generally realized that in this country to-day, speaking from a practical standpoint, and from a general standpoint, our entire acreage of productive land is practically under cultivation to-day. We can add some few thousands or hundreds of thousands of acres by such irrigation projects as are practical. In my own State of Virginia we can drain the Dismal Swamp area, and the land will probably be very rich when drained, but that is just a drop in the bucket compared with meeting our increased food consumption demands, and consequently the fertilizer-using farmers and the use of fertilizer as an economic crop production method has no longer got to compete in this country with virgin fertile lands brought under cultivation.

Fertilizer consumption in the eastern States is very seriously handicapped and always has been seriously handicapped by the gradual westward trend of crop production onto the very fertile virgin plain in the eastern Mississippi Basin, through the corn belt, Illinois, Indiana, Ohio, etc., then across the Mississippi into Iowa and Missouri and the great wheat-producing sections of the country, but that is no longer an increasing competitor, and in fact the use of commercial fertilizers is gradually extending through that territory. It is becoming very extensive now through the States of Ohio, Indiana, and Illinois. And in Missouri they are beginning to use fertilizers. They are beginning to realize the exhaustion of their soil. The important thing in the discussion of fertilizer centers around price. That is the crux of the whole question. There is nothing else that is one-half as important; in fact, there is nothing else that is one-tenth as important as the price of the fertilizer compounds.

All the consumption estimates which have been presented to various committees studying this have neglected to consider that factor. I believe they state the use of nitrogen fertilizer doubles about every 10 years; that is, nitrogen in the commercial form. That is true, if the price is to be maintained at the level at which it has been maintained, but if you cut the price of nitrogen fertilizer compound to any extent, even one-fourth or one-third, the expansion of the use will grow tremendously, because it is largely used now on all crops where it will pay a commercial return, and the reason it is not used on wheat is because it won't pay a commercial return except on land that has got to have it in order to grow wheat; I would not recommend to any farmer in Senator Norris's State of Nebraska that he should put nitrogen at 20 cents a pound under wheat, because the increased yield of wheat on an average normal condition

would just about break even, and if he had any climatic difficulty, like a slight drought even, he would lose the investment in his fertilizer.

But I would recommend to the farmers in Senator Norris's State of Nebraska that if they could buy nitrogen at 10 cents a pound they put it under wheat, because it would pay.

That is the whole situation as to price. That price is the determining factor of what a fertilizer—

Senator NORBECK. Price is the determining factor of everything. If land was cheaper we would buy some land, too, and it is the same thing all over the country. The question here is what is the possibility of reducing the price, and what is the best method of doing it? We will admit all that you say.

Mr. BOWER. I will come to that. But the reason I am emphasizing this is because of the position of the National Fertilizer Association in their long testimony before the House committee. I don't know whether they have requested hearings before this committee or not, but Mr. McDowell, the president of that association, was before the House committee, and he neglected absolutely the whole price phase of it. He set up what the farmers could do and should do and how it should be done. But the price phase did not enter into his mind at all.

The three fertilizers, as I have said, are nitrogen, phosphorus, and potash, and I want to impress upon the committee that of those three nitrogen holds the most prominent position. Potash is almost negligible. Phosphorus is important, but nitrogen is the crux of the whole situation in fertilizer.

Just to illustrate that, in the first place on most agricultural soils that need commercial fertilizer, nitrogen is the limiting factor of crop production. That is, it is the element that is most lacking, and it does not do any good at all to put a phosphorus fertilizer on to grow plants on soils that are lacking in nitrogen. The old illustration used by all the experiment colleges, and the best and the simplest one, is to picture the soil fertility as a barrel with three broken staves. The one broken off about one, third the way up the barrel is the nitrogen stave. The stave broken off about halfway up the barrel is the phosphorus stave. The stave broken off, say, three-fourths of the way up the barrel is the potash stave. Picture the growing of the crop as the filling of that barrel. Your crop will grow right up to the point where nitrogen gives out, and it does not make any difference that the phosphorus stave is here halfway up to the top of the barrel; the crop grows right up to the nitrogen stave, where it ceases to get the nitrogen it requires.

If you put the nitrogen stave in all the way up to the top of the barrel, the crop will grow and will reach halfway up to the top of the barrel and will stop growing where the phosphorous rock stave is broken.

If you put the phosphorous stave in it will run up clear up to three-fourths the height of the barrel, where the potash breaks through, and if you put that stave in, you get the full normal crop; and when I say normal crop, you get a crop that is normal as far as the elements of fertility are concerned, aside from the rainfall and other factors are concerned, but so far as the soil fertility elements are concerned, you get a crop that will run out at the top of the barrel.

A 100-bushel crop of corn in grain and stalk will take out of the soil 148 pounds of nitrogen, 23 pounds of phosphorus, and 71 pounds of potassium. One hundred and forty-eight pounds of nitrogen to 23 pounds of phosphorus and to 71 pounds of potash.

You may question why I said potash was negligible. In most all of our normal soils potash is a very, very heavy component of the soil itself. It is often unavailable in the form that it is in the soil, but it is there in large quantities and with proper soil treatment and soil handling the potash can be made available, so that although the crop takes out a very large amount, it is very seldom a limiting factor, and the principal limiting factor is the nitrogen and phosphorus.

In 1909 corn, wheat, and oats, three cereal crops in the grain alone, took from the soil 3,965,000,000 pounds of nitrogen, 606,000,000 pounds of phosphorus, and 875,000,000 pounds of potassium.

This nitrogen would require, in ammonium sulphate, 9,912,500 tons per annum to replace. That is a indication of the actual demand for nitrogen on the American farms. That is replaced through nitrogen bacteria acting in the soil itself, which is nature's own way; it is replaced by the growing of legumes and the plowing under of clovers, alfalfa, cow peas, soy beans, and many other leguminous crops; and it is replaced by the application of commercial fertilizer.

The difficulty with the replacing of nitrogen in the soil has been the price of nitrogen. I think right there I would like to quote from the president of the American Cyanamid Co., Mr. Frank Washburn, in hearings before the Committee on Agriculture of the House on February 9, 1916. Mr. Washburn stated:

"I believe, therefore, that the best way in which I can contribute something of possible value to your deliberations is to confine myself in the main to what is possibly the most important single difficulty the farmers of this country face in the matter of fertilizing their crops, and the most effective single remedy therefor. I refer to the always high and frequently prohibitive cost of the nitrogen fertilizer as the difficulty and to Government cooperation in the establishment of nitrogen industry within the borders of the United States as the remedy."

Then he goes on to say:

"The answer to the fertilizer problem, to be of any practical and immediate value, must lie in revolutionizing present conditions instead of a slow evolution proceeding under their domination."

I want to refer back to that last statement a little later.

Then, with that situation, the question resolved itself into what can be done, as Senator NORBECK stated. What assurances have we got? What have we got on which to base our belief that development and operation of this plant will result in lower-priced nitrogen?

In testifying on S. 4971 before this committee of the Senate on March 16, 1916, Mr. Washburn stated, on page 5:

"What has been obtained, economically speaking, is this: That the factory costs (that is, of cyanamid) under most favorable conditions, those which are not only theoretically obtainable, but actually obtainable in some parts of the world, everything, including overhead and superintendence and all that sort of thing inside the factory, but not including interest on investment, for producing nitrogen, comparable to the nitrogen that is in the Chilean nitrates is about one-third of the ordinary market price of the Chilean nitrates.

"Senator SMITH of South Carolina. You mean to say that the factory cost is about a third of the selling cost?"

"Mr. WASHBURN. Of the selling cost of Chilean nitrate."

Senator NORBECK. He meant there, if I understand the point you are trying to make, that the cost of the investment was the larger cost of the fertilizer?

Mr. BOWER. No. This was factory cost. He was giving the factory cost without including the interest on the investment, because previously we did not have figures as to what the plant investment would be.

Senator NORBECK. Is he the same man who testified before this committee?

Mr. BOWER. Yes, sir; in 1916.

Senator NORBECK. Do you mean this man who testified a week or so ago?

Mr. BOWER. That was Mr. Hammitt, representing the same corporation.

Senator NORBECK. His testimony was that they were practically shut down because they were unable to produce nitrate that would take care of their overhead. They shut down and not only failed to pay dividends, but failed to pay operating expenses, and it was for that reason they shut down.

Mr. BOWER. There are some interesting features in regard to that.

Senator NORBECK. He took the position before this committee that if costs could be reduced it would be decidedly to their advantage to run without a loss rather than to stand still and have a loss.

Mr. BOWER. Sure. There is no question about that.

Senator NORBECK. But they found themselves unable to do so; therefore they have that big investment standing idle.

Senator KEYES. Mr. Bower, does the witness whom you quoted there state what countries he refers to as "some foreign countries"?

Mr. BOWER. Yes; and he goes on and explains that this favorable location, etc., is the Muscle Shoals location. He was testifying on the Muscle Shoals development at that time before this same committee.

There appeared before this Senate committee in 1916 Doctor Backeland, one of the great independent consulting chemists of the country, and on page 113 of hearings on S. 4971 he says:

"The statement is made by the present Government monopoly in Germany that after the war is over and after what they know now about the synthetic manufacture of nitrogenous fertilizer from the air, after all the experience they have acquired during the war while making nitric acid, that they will be in such condition that they intend to furnish to the farmers of Germany nitrogen fertilizer at about one-half the price it is costing the consumer here in the United States. If Germany can do that, gentlemen, there is not the slightest doubt in my mind that we can do the same here or that we can do better."

As confirmation of the fact that Germany is doing that I have here a brief prepared by the Koppers Co., of Pittsburgh, Pa., designers and builders of by-product coke and gas oven plants, one of the largest designers and builders of by-product coke oven plants, asking for protection on ammonium sulphate in the tariff law. One

of the reasons why they ask for protection by legislation was the German nitrogen fixation plant.

The CHAIRMAN. Who is that?

Mr. BOWER. The Koppers Co.

The CHAIRMAN. Who was testifying there?

Mr. BOWER. This is a brief prepared by the Koppers Co. and argument in support of a duty on ammonium sulphate and ammonia products.

The CHAIRMAN. What company is that?

Mr. BOWER. The Koppers Co.

The CHAIRMAN. Yes.

Mr. BOWER. That is the largest—well, now, I am not sure whether it is the larger of the two great companies in this country who design and direct and operate under contract the great by-product coke ovens.

The CHAIRMAN. They made their product from the coke?

Mr. BOWER. Yes, sir; from coking coal, and they are asking protection in the present tariff bill on ammonium sulphate, their nitrogen product, against German air fixed nitrogen into this country.

The CHAIRMAN. Can you tell us whether they succeeded in getting the committee to put a tariff on it?

Mr. BOWER. They succeeded, Mr. Chairman, in the House committee, without a hearing, in securing \$12 duty a ton on ammonium sulphate in the bill as it passed the House.

The CHAIRMAN. What did the Senate do?

Mr. BOWER. The Senate, after we had made a vigorous fight against any duty on ammonium sulphate, have reported it out with a duty of \$5 a ton on nitrogen.

They cite, as one reason why protection by tariff is needed, that—

“The cost of operating these plants is relatively low, so that even to-day sulphate of ammonia is being sold in Germany at half the price in the United States, based on the present rate of exchange.”

The CHAIRMAN. Of course, that is very proper evidence and I am interested in it, but they were asking there for a tariff.

Mr. BOWER. Surely.

The CHAIRMAN. Like most of these people who are asking for a tariff on their products, it is known and considered that they are vitally interested in it, and their testimony must be weighed accordingly.

Mr. BOWER. I appreciate that, but that is the testimony, and why it is so interesting to us is that it is the testimony of the opposition who come here and tell us that they can make all the ammonium sulphate we need, and that we do not need to operate the Muscle Shoals plant, and they have gotten out briefs, and I have copies of their propaganda, in opposition to the Muscle Shoals plant, saying that they can furnish us all we need at any price we want it, and then they come here and ask and get \$12 a ton duty on the ammonium sulphate in the House, and they have got \$5 a ton as it stands in the Senate to-day.

The CHAIRMAN. I think we are all agreed that there should be operation of Muscle Shoals, but we disagree on how to do it.

Senator HEFLIN. If they get this duty that they ask for it will increase the price of fertilizer to the farmers, won't it?

Mr. BOWER. I should think there could be no question about that and, furthermore, as I see it, with the only competitor in the ammonium sulphate industry in this country to-day being Chilean nitrates, and Chilean nitrates having a price fixing arrangement of their own and a distribution arrangement of their own, the Chilean Nitrate Association would immediately take advantage of the duty on ammonium sulphate and raise the price of Chilean nitrates accordingly.

The CHAIRMAN. That means they would increase the export duty?

Mr. BOWER. Well, I don't know whether they could do that, for this reason, that they would have to increase the export duty generally. But the Chilean association could raise the price of Chilean nitrates in this country.

Senator HEFLIN. In order to meet the price advance by this other concern?

Mr. BOWER. Exactly so.

Senator HEFLIN. Which would make the price to the farmer of a ton of fertilizer higher than it is to-day?

The CHAIRMAN. I have an idea that they would increase the export duty.

Mr. BOWER. They have the difficulty there that their whole exports are not coming to this country.

The CHAIRMAN. I know, but most of them do.

Mr. BOWER. Well, I don't think, Mr. Chairman, that quite 50 per cent does come to this country.

The CHAIRMAN. Does it not?

Mr. BOWER. Not quite that.

The CHAIRMAN. I do not know that I would find fault with the Chilean Government for putting on an export duty. I am inclined to think if I was a citizen of Chile I would favor that too. They have a monopoly and they are making something out of it. Of course at some time it will be exhausted. That is pretty hard on us.

Senator NORBECK. They want to get theirs while the getting is good.

Mr. BOWER. The commerce reports of the Department of Commerce Daily Consular and Trade Reports of March 21, 1921, on page 1593, under the heading "German production of nitrogen fertilizers," there is the following:

"Mr. Howard W. Adams, representative of the Department of Commerce in Berlin, Germany, reporting under date of January 10, 1921, on the present situation in Germany in the production of nitrogen fertilizers by fixation of atmospheric nitrogen, writes as follows:

" "Calcium cyanamide factories engaged in the production of nitrogen fertilizers by process of fixation of atmospheric nitrogen were in operation in Germany before the war, but during the war these plants were extensively enlarged and are now in process of completion. The total output of these plants when properly supplied with coal is estimated at 600,000 tons, with a nitrogen content of 120,000 tons. Several plants representing this production, together with the possible output of each are as follows:"

Then there follows a list of five plants, the largest having a capacity of 175,000 tons and the smallest having a capacity of 60,000 tons.

"At the present time these plants are producing approximately 500,000 tons of calcium cyanamide, with a nitrogen content of 100,000 tons."

The CHAIRMAN. What process were they using?

Mr. BOWERS. The calcium cyanamide process.

Then they have, or had, two large plants in Germany under the Haber process, one at Oppau, and another one twice as large at Merseberg. The annual output of nitrogen in both of these plants is 300,000 tons.

The CHAIRMAN. Give the source of your information.

Mr. BOWER. This is from that same commerce report.

The CHAIRMAN. I know it is, but it does not so appear in the record when you were giving it.

Mr. BOWER. Yes. The statement about the Haber process is also from this same consular report.

The CHAIRMAN. Read that. What does he say about the Haber process?

Mr. BOWER (reading). "The Badische Anilin und Sodafabrik is the only concern producing nitrogen fertilizers by the Haber-Bosch process. Its first factory for this purpose was constructed at Oppau. Operations began at this plant in 1913. A second plant known as the ammonia works of Merseberg, which is twice the size of the Oppau plant was later erected and has been in operation since 1917. When properly supplied with raw material the annual output of nitrogen in both of these plants is 300,000 tons, corresponding to 1,500,000 tons of sulphate of ammonia."

And then it goes on to say before the war what they did, etc.

The CHAIRMAN. Read that if it has any bearing here.

Mr. BOWER. I don't know that it does.

The CHAIRMAN. We are interested in knowing what can be done with the Haber process.

Mr. BOWER. It is a very general statement, not referring particularly to the Haber process.

"Before the war Germany's annual agricultural requirements of nitrogen fertilizers were 210,000 tons of nitrogen, of which 100,000 tons were in the form of nitrate of soda and nitrate of lime (imported), 100,000 tons in the form of sulphate of ammonia from home production, and 10,000 tons in the form of calcium cyanamide, likewise of home production," etc.

Senator KENDRICK. It would seem from that that Germany does not find it necessary to import any nitrogen.

Mr. BOWER. I doubt if Germany is importing any Chilean nitrate to-day. Of course, since this was written they have left only one of the Haber process plants because, as you gentlemen know, the one at Oppau was totally destroyed by an explosion that killed 1,600 people.

The CHAIRMAN. Mr. Bower, have you studied the Haber process so you can tell, or have you any definite idea about it as compared with the cyanamid process?

Mr. BOWER. No, Senator, I have not. I believe it is included in the Ford offer. I have no prejudice against the Haber process. It is the process that will make the cheapest nitrogen fertilizer for him that the farmer is interested in and we would be in favor of, and believe it is covered under the research paragraph having all these various processes researched and determined as to what is best.

The CHAIRMAN. I think that is true under this proposal, and yet under Mr. Ford's proposal he gets title, absolute title, to the building and all the machinery that we own down there.

Mr. BOWER. In No. 1.

The CHAIRMAN. In No. 1, which is the Haber process, and there is no agreement as to what he shall use it for.

Mr. BOWER. No; but in the light of two things that happened in reference to the Haber process, I think possibly that would explain Mr. Ford's hesitancy to guarantee to operate that plant. I don't know whether it does or not. The first one is that if you will remember Dr. Arthur Graham Glasgow, who was appointed by President Wilson as nitrate administrator—and it was Doctor Glasgow that drew up bill S. 3390 and submitted it to Secretary Baker and he sent it to Congress—and Doctor Glasgow, in attempting to dispose of the nitrate plants down there went to the General Chemical Co., who owned the process, and built No. 1 plant, and offered them that plant free of any charge; they would pay absolutely nothing if they would spend, I believe it was, \$500,000 a year for three years to work it out and make it work, and they absolutely refused to have anything to do with it and left it as a white elephant on the Government's hands, and went up to Syracuse and built a new Haber process plant under what they claim is an additional modification, a different change, and then when you find the Haber process at Germany blowing up and killing as many people as it did, I don't know that I blame Mr. Ford for not wanting to guarantee to operate the plant, but I do believe that under the research section of the offer, he would want to research the Haber process, and if it would work out he would utilize it.

The CHAIRMAN. The thing that caused me to suspect that he did not intend to do it was because we have that building there now, and the steam plant connected with it, and he buys that, gets title to it, and he nowhere promises to do anything with it, and the theory has been that he is going to put a factory in it, tear out the machinery and use it for some commercial purpose. Now, I don't care how we get cheap fertilizer and cheap explosives. I am not interested in that. But I think any-unbiased juror, passing on the evidence that we have been able to get, would come to the conclusion that the prospects of improvement lie in the Haber process and not in the cyanamid process. Now, I can not reach any other conclusion from the evidence, and I don't want to give it up, and the evidence is undisputed. The Syracuse plant is operating now. They don't make it cheap enough, probably, to make fertilizer with it.

Mr. BOWER. It is a very small plant.

The CHAIRMAN. It is a small plant, but they are putting it on the market. Our experts say if we will do the same thing, if we will spend a couple million dollars to remodel plant No. 1, we can produce fertilizer there. It is an experiment and we may lose all our money, but that is the way all developments are made, by experimentation, and I don't think we ought to give up the Haber process because of the fact that somebody got killed by an explosion. That is true of powder mills and glycerin factories and all that. A fellow was blown up in a Ford, too, the other day, but that is no reason why he should stop making Fords.

Mr. BOWER. I believe the danger in the Haber process is always an element that has to be figured on. There is no question about that, and the chemists who know will agree that that is true, that that is an extremely delicate process, under tremendous pressures and heat, dealing with an explosive compound, and it always has an element of risk in it. I think undoubtedly that could be properly safeguarded against and I am not at all convinced that under the terms of the Ford proposal the Haber process would be abandoned, because, looking at it from a business standpoint, if Mr. Ford guarantees to make a certain amount of nitrogen and he can do it cheaper and better by the Haber process than he can by the cyanamid process, knowing the principles he has followed in his business, he undoubtedly would do it, yet at the same time, with the present Haber process record, I don't know if I were Mr. Ford, whether I would guarantee to run No. 1 plant or not. I doubt if I would.

Senator Keyes. As I recall Mr. Mayo's testimony it was to the effect that they intended to use No. 1 plant for manufacturing purposes, making motor parts, or something of that sort; there was no intention to use it for fertilizer.

Mr. BOWER. There is a lot of machinery at No. 1 plant, as it at present stands, that is of no value for manufacturing nitrogen, that did not work, and that the General Chemical Co., who designed it, have abandoned, and in their new design have gone over to a new change, consequently it would mean the expense of remodeling that plant. I have never discussed it with any of Mr. Ford's engineers, but my thought would be if he is going to develop the Haber process he would probably do it up at No. 2, so that he would have all the fertilizer manufacture at one place, instead of having it down at No. 1, if he has got to spend around \$4,000,000 to do it.

The CHAIRMAN. When Major Burns was on the stand he explained about the explosion over there in Germany, and I think he made it perfectly plain to the committee that it was really carelessness that brought it about. If it had been handled with ordinary care it would not have happened.

Mr. BOWER. I think that is true. I don't know about the ordinary care, Major Burns.

Major BURNS. The Oppau explosion was not caused by the Haber process. It was caused by the detonation of ammonium nitrate, which is one of the products of the Haber process, and you could get exactly the same material from the cyanamid process or any other process.

Mr. BOWER. Is it not still a disputed question, but is it not thought by a great many that one of the bombs under the Haber process was what caused the detonation of the material?

Major BURNS. The explanation that is given by those who have investigated it is that the explosion was caused by a detonation of a combination of ammonium nitrate and ammonium sulphate. I don't think it is fair to charge it up to the Haber process at all.

Mr. BOWER. Of course you gentlemen in the Ordnance Department would have superior sources of intelligence about that to we outsiders.

Major BURNS. We have received quite a number of reports from various investigating committees.

Mr. BOWER. I have seen several printed reports—I don't know how scientific it would be—in which they said it was one of the bombs that let go that caused the other detonation.

Major BURNS. They were blasting with explosives in order to put it on the fertilizer market.

Mr. BOWER. Even so, the psychological effect on Mr. Ford's mind would be such that he might not want to guarantee that proposition. He knew a Haber process plant blew up, and that is what the general people of the country know, that a Haber process plant blew up.

I think, Senators, we might drop this, because really I am hypothecating a good bit as to what Mr. Ford might do and might not do, and I am getting away from our discussion.

The CHAIRMAN. Well, if your idea is correct, that he was worried about an explosion and, for that reason, did not want to guarantee the manufacture of nitrate by the Haber process, then your idea that he wanted to move it down and do it all at one plant is certainly erroneous, because the Haber process plant is 5 or 6 miles from the cyanamid process plant, and if he was afraid of its blowing up he certainly would not put them together and blow them both up instead of blowing up one of them.

Mr. BOWER. My thought was that he would not adopt the Haber process at all until he had researched its practical operation, in which case the danger of explosion would be practically eliminated, and in that case he would want it all at one plant instead of separated; but, as I say, I think this is rather hypothetical and not especially germane to the situation before us.

I want to go back to the statement that I read from Mr. Washburn's testimony about the necessity of making this next change in fertilizer development by an extraordinary or revolutionary means and not allowing a slow process of development under the present fertilizer organization. That is not so much a criticism of the present fertilizer organizations as a result that follows from an attempt to get away from what is most harmful in the present fertilizer business, and that is largely the crux of the whole proposition.

Commercial fertilizer as it is manufactured to-day and delivered to the farmer is a mixing business. The fertilizer manufacturers buy ammonium sulphate or nitrate of soda or cottonseed meal as a source of nitrogen. Some of them mine their own phosphate rock; others buy it and they buy the potash ingredients and mix these combinations to sell to the farmer.

A great handicap is the low content of the materials out of which these fertilizers are mixed. Available phosphate fertilizer contains, the best form, only 16 per cent acid phosphate, and if you want to make a commercial fertilizer, say 2-8-2 goods, you use 1,000 pounds of 16 per cent acid phosphate, and it leaves you a resultant 8 per cent phosphate content in the mixed goods. The filler, so called, is not the crux of that situation at all, but it is the low content grade of materials that are used in mixing the fertilizer.

I have that thought illustrated here in a document from the Department of Agriculture (U. S. Department of Agriculture Bulletin 798):

"A concrete example may help to make this proposition clear. If it is desired to make a mixture containing 2 per cent of ammonia, 8 per cent of phosphoric acid.

and 2 per cent of potash (the well-known grade, 2-8-2) and the materials at hand are cottonseed meal, containing 7 per cent of ammonia, acid phosphate, containing 16 per cent of phosphoric acid, and Nebraska potash, containing 28 per cent of potash, the method of making up the mixture will be as follows: 2 per cent of a 2,000-pound ton is 40 pounds. In order to obtain 40 pounds of ammonia from 7 per cent cottonseed meal, it will be necessary to use 571 pounds of cottonseed meal. The amount of phosphoric acid desired is 8 per cent of a ton—or in fertilizer parlance, 8 units—or 160 pounds. To obtain 160 pounds from a 16 per cent acid phosphate will require 1,000 pounds of acid phosphate. The amount of potash called for is 40 pounds, and to obtain that from a 28 per cent material 143 pounds will be required. The total amount of materials used, therefore, will be 571 plus 1,000 plus 143, or 1,714 pounds. To this are added 286 pounds of filler in order to make up the ton.

"It will be seen from the foregoing statement that filler has not only a legitimate but a necessary use in the preparation of mixed fertilizer under the existing methods of manufacture. While it is likely that in the 5,000,000 tons of fertilizer produced during 1918 more than 217,000 tons of filler were used, the filler constituted only a small proportion of the inert matter in the mixture. Thus, in the example given the 2,000-pound ton contained 286 pounds of filler, while the total of inert matter was as follows: Of the 571 pounds of cottonseed meal, 531 pounds were inert; of the 1,000 pounds of acid phosphate, 840 pounds were inert; and of the 143 pounds of Nebraska potash, 103 pounds were inert, so that the total inert matter in the plant food bearing materials was 1,474 pounds, and the ton of fertilizer consisted of 240 pounds of plant food, 1,474 pounds of inert matter in the plant food bearing materials, and 286 pounds of filler.

"The fact that from three-fourths to seven-eighths of the mixed fertilizer sold to farmers consists of inert matter which does not contribute to the fertility of the soil, but on which freight must be paid and which must be ground and bagged and transported, is one of the fundamentals in the fertilizer industry. If a means were devised by which farmers could buy practically undiluted plant food and make up their own mixtures, an enormous saving would be effected, and any method that would decrease the amount of inert matter carried in fertilizers would be of great benefit to the agriculture of the country. The quantity of filler used is only a minor phase of this problem, but perhaps the part of it which is most easily susceptible of improvement while the present general methods prevail in the industry."

For instance, if you have 16 per cent of acid phosphate, the other 84 per cent of that is calcium sulphate and other impurities containing no fertilizer plant food at all, yet that has to go into this 2-8-2 mixture.

In your cottonseed meal, 7 per cent is nitrogen and there is a little percentage of acid phosphate in there and a little percentage of potash, but it is usually negligible. The balance of it is another useless material, carrying no plant food whatever, yet they have to use that as a source of nitrogen.

So these 2-8-2 and 3-8-3 goods are not the fault of the fertilizer mixers as they are to-day, but are the fault of the raw materials out of which they have to make the fertilizer and the filler, as such, which is added to bring the percentage out exactly even. Three-eighths usually does not consist of over 300 or 400 pounds of fillers if it consists that much; often only 200 pounds of sand or humus, this actual filler that is put into it. The other useless material is the result of the low grade constituents of which the fertilizer is manufactured.

Now, there is one way to get away from that and that is at one jump to make high-grade constituents. The trouble is that you can not jump from 16 per cent acid phosphate to 20 per cent acid phosphate. The next chemical combination that gives you available acid phosphate is up around 40 per cent soluble acid phosphate. The present fertilizer association adds sulphuric acid to render phosphate rock available. In the case of the Virginia-Carolina Chemical Co. they follow that clear down the line until they themselves own sulphur mines to produce their own sulphuric acid and treat rock phosphate and make 16 per cent acid phosphate.

Now, if we are going to get 40 per cent soluble phosphoric fertilizer through the electric-furnace method, their investment in their sulphur mines and the whole thing down the line has to be scrapped out; so that the fertilizer association is never going to develop this thing as long as they can hold on to their present methods of these low-grade materials. The opposition of the fertilizer association is not based on just the belief that Mr. Ford would compete with them. It is in that research and development of these high-grade plant foods and what the electric furnace will do for fertilizer compounds that they fear which they know will force them to these high-grade materials and make them scrap this sulphuric acid treatment of fertilizer compounds. That is all an economic waste, every bit of it, if you can find a method that does away with it, because, if you take a ton of raw phosphate rock and in order to make it avail-

able and send it to the farmer you add to that a ton of sulphuric acid, the rock contains 32 per cent P_2O_5 acid phosphate. The resultant 2 tons of fertilizer, acid phosphate fertilizer, only averages 16 per cent, because you have added a ton of sulphuric acid, and it carries absolutely no value whatever to the farmer, except that it makes the phosphate rock soluble and available for fertilizer.

Now, if you can, as has been testified before the House committee, both by Doctor Whitney, Chief of the Bureau of Soils, and by Mr. Swann, of Anniston, produce in the electric furnace phosphoric acid from phosphoric rock, and treat the phosphoric rock with phosphoric acid, you get a double super phosphate carrying from 40 to 50 per cent soluble phosphorus, and you have not added any useless material whatever, and you cut out an economically wasteful sulphuric acid proposition.

Then, if you can make phosphoric acid in the electric furnace, as Doctor Whitney says he can do and as Mr. Swann says he is doing at Anniston, and have a successful commercial fertilizer, you can absorb the ammonia from your air fixation process, but the ammonia with phosphoric acid would make ammonium phosphate. The present method is to absorb the ammonia with sulphuric acid to make ammonium sulphate. Again, you have an absolute economic waste to the farmer. While, under these new methods, if you take phosphoric acid from the electric furnace production and make ammonium phosphate, you have to cut out the sulphuric acid, and you carry the ammonium to the farmer and you have used two forms of plant food in one chemical combination.

The ammonium phosphate analysis is about 20 per cent nitrogen and 40 per cent acid phosphate; so, instead of buying 2-8-2 goods and 3-4-3 goods, carrying in one case, 12 per cent of plant food, and in the other case 14 per cent, we are carrying to the farmer a plant food which contains 60 per cent of plant food, with all the resultant saving of labor, hauling, bagging, warehousing, and freight, which is a big item.

I do not want to give you the name of the gentleman who told me this, but I had a confidential conversation with one of the representatives of the big fertilizer interests, who came into the farm bureau the other day to see me with reference to the potash tariff. In discussing the question he told me that the farmers were objecting to their present prices of fertilizer. The combination of 3-8-3, he said, which we were selling at \$20 before the war, and which went up to \$35 and \$40 during the war, was now only down to \$30, and they ought to be materially lower than they were before. Now, he says, "I want to tell you frankly that \$10 of that is freight on materials coming to our factories and materials going back to the farmer; that one-third of the price that we are asking to-day for our 3-8-3 material is freight."

And it is freight paid on sulphuric acid to make that 8 per cent acid phosphate and on similar materials. If we can cut out that uneconomic proposition through these new developments and get 60 per cent plant food, it will be a good thing. There is a lot of argument that the cyanamid process will not produce ammonia as cheaply as the by-product coke ovens. I tell you frankly, gentlemen of the committee, that if the cyanamid process will produce ammonia at Muscle Shoals at the same price per unit as the by-product coke ovens do, and this phosphoric acid can be produced as Doctor Whitney and Mr. Swann say, as cheaply per unit as the acid phosphate, and cheaper, and those two are combined and shipped to farmers, we will get our half price fertilizer, because the difference between the cost—handling, bags, storage, freight, etc.—on 3-8-3 goods and 60 per cent plant food will cut the price in half by the time it gets to the farmer, and when you realize that in addition to that—

The CHAIRMAN. Of course, you want us to give this contract to Mr. Ford. If nobody but Ford could do that I think we would have more argument on the fertilizer part of it any way. But is it confined to any individual? Could not anybody do that if it can be done at all?

Mr. BOWER. Nobody has offered to do it.

The CHAIRMAN. Why does not somebody do it as a matter of business?

Mr. BOWER. In the first place, the fertilizer industry will not offer to do it. They are fighting it.

The CHAIRMAN. Suppose the bill which is pending here, which I have introduced, was passed, and suppose this Government operation was handling this plant, could they not do it? Suppose anyone else; suppose Mr. Enstrom got it under his contract? Could he not do it? Is there any reason why Ford is the only man who can do that? He does not have any patent on that process that you are speaking of, has he?

Mr. BOWER. No. It is possible, though, that you might have to buy these processes. They are patented. I am just wondering, under the Government corporation, suppose Mr. Swann would ask you for \$750,000 for his patent, would the Government ever appropriate that money to buy the patent from a single man—three quarters of a million dollars?

The CHAIRMAN. This corporation would not ask the Government to do it. They would be just as free to do it, if they wanted to, as Ford would.

Mr. BOWER. Oh, I see. Of course, our thought is this, that in Mr. Engstrum's proposal you could possibly do these things, if it was accepted.

The CHAIRMAN. Now, let us take his proposal. Would it not be to his interest the same as to Mr. Ford's interest to do it, and would it not be to the interest of the Government corporation to do it if it could be done?

Mr. BOWER. Oh, there is no question about that. It would be to their interest to do it, surely; but when you realize that Mr. Ford's proposal is the one that comes up here and says "I will research, and if I discover it, I will use it," you will understand our proposition, because Mr. Engstrum's proposal does not say that.

The CHAIRMAN. Oh, yes; he makes a very elaborate proposal on the development plant end of it. That is one of the things in this bill, too, that this corporation shall maintain and carry on at all times the experimentation with a view to improving these methods, just the same as Mr. Ford's proposal. I am not criticizing Mr. Ford for doing that. That is one thing in his favor, but the same thing applies to everybody excepting, perhaps, the fertilizer people who, as you say, have an interest in it.

Mr. BOWER. They have an interest in defeating this development.

The CHAIRMAN. Yes.

Mr. BOWER. There is no question about that, and they are striving very hard to do it. That does not only apply to Mr. Ford's proposal, but, as you know, last year, Mr. Chairman, they were against the proposed Government operation. They are against this whole development.

The CHAIRMAN. They are against the bill that I have introduced just the same as they are against Ford.

Mr. BOWER. There is no question about that.

The CHAIRMAN. No; there is no question about that.

Senator NORBECK. Mr. Chairman, as I understand this matter, the so-called fertilizer people have millions of dollars invested in plants that are idle because they claim to be unable to produce fertilizers cheaply enough for the farmers to buy in quantities, owing to the low prices of the farm products. Would it not be to their decided financial interest to undertake a new method by which they could produce fertilizers cheaply enough to sell at a profit, and thereby be making money instead of having their plants standing idle and losing money?

Mr. BOWER. Senator Norbeck, I think you are confusing the American Cyanamid Co., which is not classed as one of the great fertilizer manufacturing concerns, with the great fertilizer industry of this country.

Senator NORBECK. No; but the evidence here shows that there are none of the fertilizer concerns that are able to sell their output.

Mr. BOWER. Well, that is true, under the depression of crops.

Senator NORBECK. Surely.

Mr. BOWER. Due to the depression of prices on farm crops.

Senator NORBECK. And the high producing costs.

Mr. BOWER. And their costs and the farmers' lack of producing power has undoubtedly hit them very hard.

Senator NORBECK. You feel now that they would just as soon adopt another method by which they could produce this cheaper?

Mr. BOWER. Undoubtedly.

Senator NORBECK. And by which they could sell it at a profit?

Mr. BOWER. Undoubtedly.

Senator NORBECK. Well, they do not know how to make money; that is the trouble with them, is it not?

Mr. BOWER. In the first place they would have to scrap a good bit of the capital already invested.

Senator NORBECK. Well, is not that the whole history of manufacturing in this country, to scrap investments in machinery and plant and rebuild them when they can operate more cheaply and by a better process?

Mr. BOWER. Yes. The entire history has been, though, to maintain a monopoly of that kind, where they control the whole business, as far as they can possibly do so, and to tie to their present processes of manufacture. They expect that with the resumption of agricultural prosperity, which we all hope for—I will not say prosperity, but a return to the farmer's normal condition in life, that he will be able to buy their fertilizer.

Now, I have had confidential information from three sources to the effect that this very patent of superphosphate rock production has been owned and patented by one of the large fertilizer companies of Baltimore for the last five years and they have simply pigeonholed it. They have not put it in operation at all, because it would simply mean the destruction of their whole sulphuric-acid end of the business that they have. They will not do that, but they would be forced to by this development, but unless it is developed they won't do it.

Now, it is not imagined by the farmers that at Muscle Shoals can be made all of the fertilizer you need; but if you take this step and give the farmers this kind of materials, the rest of them will have to do the same thing and come across and produce these high-grade goods, because the farmer will not stand for anything else, the farmer will not buy 2-8-2 if he ever gets hold of ammonium phosphate. There is no question about that.

Senator HEFLIN. The farmer now is paying freight on millions of tons of stuff which is useless to him?

Mr. BOWER. Absolutely so.

Senator HEFLIN. And you believe that if we place this development at Muscle Shoals in the hands of Mr. Ford, that will be eliminated very largely?

Mr. BOWER. Very largely.

Senator KEYES. Don't you think it would be eliminated by putting it in the hands of anybody who would operate that plant?

Mr. BOWER. If they would do these things, but not in the hands of the present fertilizer combination.

The CHAIRMAN. How are we going to prohibit these fertilizer people from buying Mr. Ford's corporation after he dies? They would eliminate it then and add it to the combination.

Mr. BOWER. Well, Mr. Chairman, that is along the line of the discussion that took place yesterday, and I can not see anything, except regulation when the crisis arises as the solution to that problem. I know one thing, and that is that this board of farmers, sitting in and going over the books of that concern, as far as the fertilizer side of it is concerned, will prevent their getting away with anything or putting anything over on agriculture.

The CHAIRMAN. All right. Let us take that up. I did not like to interrupt you because you said you were going to discuss it later, that paragraph 16.

Mr. BOWER. Paragraph 16, I believe.

The CHAIRMAN. You have seen men elected to the Senate and House and to other official positions on one platform and you have heard them say what great things they were going to do for the people after election: you have seen them go back on them, have you not? You no doubt could call to mind and mention by name a great many instances of that kind in your brief experience with legislators. You have often seen corporations and companies organized to carry out philanthropic purposes, and you have seen special interests get control of them, and do absolutely the opposite to what they had intended to do, and yet you have mentioned by name an organization of farmers of whom you are one of the representatives at the present time, that shall be an instrumentality in the selecting of the members of this board a hundred years from now. Can you give any assurance that the Farm Bureau that you now represent will not next year, even, be absolutely controlled and dominated by the Fertilizer Trust, or the representatives of that organization? I am not making any such charge.

Mr. BOWER. Oh, I appreciate that.

The CHAIRMAN. But the charge has already been made on the floor of the Senate that your organization now is to some extent under the domination of the fellows that control the railroads.

Mr. BOWER. Well, we simply point to our records, as far as that is concerned.

The CHAIRMAN. Yes; but these farmers' organizations that are mentioned in there very likely will not be in existence 50 years from now.

Mr. BOWER. No; but their successors will. The organization of the agricultural business is here to stay.

The CHAIRMAN. Yes; I think so; but the danger is that these very special interests that you are referring to will control your own organization, and it would be to their interest to do it if, by doing it, they could control that board.

Mr. BOWER. At the same time they would have to control the President of the United States, who makes the nominations, and the United States Senate which confirms them.

The CHAIRMAN. And that would be a good bit easier, probably, than to control your board.

Mr. BOWER. Well, if you get a combination that can control all three representatives of the people, we could not get any fertilizer from anybody anywhere.

The CHAIRMAN. You have seen Presidents of the United States controlled very easily; the people were asleep while they were getting hold of them. Now, have you ever followed a convention of the Republican Party or the Democratic Party and observed how very little the rank and file, the real people, have to say about who the nominee will be, and that will occur again when the next convention takes place? You have seen it with the Senate, have you not?

Mr. BOWER. Mr. Chairman, I would like to ask you what you would suggest instead of that. If they get control of the United States Senate and control of the President of the United States, they are going to get control of your corporation.

The CHAIRMAN. Probably, but my corporation is going to live a good deal longer than yours without a change. Now, it may change. I realize, Mr. Bower, that there is not any way under the heavens to fix it so that it can not be controlled. You mentioned the Federal Trade Commission in there. I have not as much faith in the Federal Trade Commission as you have, and I have always been one of its defenders, but I realize that in 10 years from now the Federal Trade Commission may be dominated by this corporation that you are scared to death about right now. We can not get away from it; it is an impossible thing. We hope those things will not happen, but they are liable to happen with any of us. That is the only reason why I do not want to enter into a deal that will run for a hundred years and block the people's rights.

Mr. BOWER. The paragraph dealing with the creation of this board was referred to the executive committee of the Farm Bureau Federation in session here in Washington at the time it was written, and the executive committee approved that method. We believe that if the farmers themselves sat in by invitation, with the right to go over the books and the right to appeal to the Federal Trade Commission for relief they would get relief, if there was any improper thing done.

The CHAIRMAN. As at present constituted, I think they would do it.

Mr. BOWER. As at present constituted; yes.

The CHAIRMAN. Now you can assume that the Federal Trade Commission will be a permanent body, but you can not assume that this organization is going to be permanent.

Mr. BOWER. If these interests got all of that control they would probably do away with the Federal Trade Commission.

The CHAIRMAN. If, instead of mentioning your organization or some other organization, you had left it in a general way to organizations representing the rank and file of the farmers of the country, or something of that kind, it would be a whole lot better, and if your organization represented them, well and good; and if they did not, they ought to be out, as they ought to be.

Mr. BOWER. I would like to have Mr. Silver discuss that phase of the matter.

Mr. SILVER. If you do not mind, Mr. Chairman, could we finish this direct examination?

The CHAIRMAN. Oh, yes.

Mr. SILVER. We would be glad to say something about that after we put this in in sequence and connectedly.

The CHAIRMAN. All right.

Mr. BOWER. With reference to nitrogen production, I simply want to say that, in spite of the representations that are being made in opposition to this development as a whole, there is no industry in America primarily engaged in nitrogen production. I say "primarily engaged in nitrogen production." The by-product coke ovens are the largest domestic producers of nitrogen compounds and their nitrogen is only one of numerous by-products. Their major industry, of course, is the production of coke. Mr. McDowell, president of the National Fertilizer Association, testifying before the House about the prices of the by-product coke ovens, says that they make ammonia for \$1.50 a ton. I am surprised that those figures are so low. Nevertheless I think it is quite certain that before the by-product ovens would abandon the production of ammonium compounds for fertilizer usage, the price would have to be materially lowered over what it is being sold for to-day. Of course, there is a certain fixed cost in the actual production of this ammonia that they would have to meet.

It must be remembered also, in figuring on the capacity of the ammonium sulphate ovens, that they give their capacity in terms of ammonium sulphate. For instance, they say that in 1920 their capacity was 467,000 tons of sulphate equivalent. That does not mean a production of 467,000 tons of ammonium sulphate. In 1920 the actual sulphate production was 337,500 tons. The balance was ammonia, ammonia liquor, anhydrous ammonia, and ammonia for household purposes. The ammonia liquor and the anhydrous ammonia are the first market they supply before they make ammonium sulphate. I do not mean the first in point of time, but the first in point of economy of operation. That is, they produce ammonia in the form of gas. Of course, that is not commercial. The simplest way to make it in commercial form is to absorb it in water, and when it is in that form it goes out for refrigeration and household purposes. Whatever the demand is for ammonia in that form it is supplied economically first, so that what we get is a by-product with a preferential first market from the by-product coke ovens, and we get what is left, and, as I showed at the beginning of our testimony, our demands for nitrogen far exceed the actual production

of ammonium sulphate, which in 1920 was 337,500 tons. The nitrogen required for just corn, wheat, and oats alone for one year would take over 9,000,000 tons of ammonium sulphate to supply it. Those figures that I am giving you are taken from the United States Geological Survey reports.

Senator NORBECK. The 9,000,000 tons would be the entire consumption, would it, or would you put something additional into the soil?

Mr. BOWER. No; it is this, Senator Norbeck: That is the amount of nitrogen contained in the grain alone of those three crops in one year. That is, corn, wheat, and oats, in the grain alone. I figure, though it is not true, that in that case the straw and roughage went back into the land, but there is a waste and loss in handling the manures and refuse.

Senator NORBECK. Would that mean, then, that it would take 10,000,000 tons a year to really keep the soil replenished?

Mr. BOWER. Yes; for those three crops alone, easily. Do not get the idea that there is no action in the soil that is recovering nitrogen bacterially and through legumes and other methods. Take this Leonardtown soil all through this country here. You know how absolutely exhausted it is. There is no farming here at all, and yet right down here at Mount Vernon Washington had a flour mill on his own estate, and he exported flour to England that he raised right on that farm. A chemical analysis of that soil to-day simply shows a trace of nitrogen. It is gone. It has been wiped out by 300 years of cultivation without being replaced. It is gone.

Senator HEFLIN. Do you say it would take 10,000,000 tons to answer the needs of the grain crop alone?

Mr. BOWER. Of corn, wheat, and oats alone, in the grain. In the grain it is 9,912,000 tons of ammonium sulphate. You will find it in the first part of the hearings.

Senator HEFLIN. We now make only about 8,000,000 tons of it, I believe.

Mr. BOWER. That is gross fertilizer?

Senator HEFLIN. Yes.

Mr. BOWER. That is commercial fertilizer.

Senator HEFLIN. Yes.

Mr. BOWER. This is ammonium sulphate alone which carries around 25 per cent of ammonia, while 8,000,000 tons of fertilizer would not average over 3 per cent, I believe; surely not over 3 per cent. So you see your 8,000,000 tons is wholly inadequate. If you were going to put that nitrogen in bulk 3-8-3 fertilizer you would have to multiply it over 10 times, or 80,000,000 tons.

Senator HEFLIN. How many tons of fertilizer do you believe that we could use profitably in the United States, cotton, grain, and all?

Mr. BOWER. I could not answer that question, Senator Hefflin, and would not attempt to. In the first place, the word "fertilizer" is a very indefinite word. It may mean 2-8-2, 3-8-3, 4-10-4—

Senator HEFLIN. Commercial fertilizer.

Mr. BOWER. It may mean any one of a hundred different combinations of fertilizer compounds. It may mean nitrate of soda itself.

Senator HEFLIN. Doctor Whitney stated the other day that he thought we could easily use twice as much as we are now using.

Mr. BOWER. Senator Hefflin, when the price is cut twice as much will not begin to supply the demand.

Senator HEFLIN. The need is really greater than that amount?

Mr. BOWER. Oh, undoubtedly, and the commercial utilization of it would be greater than that. For instance, careful research in Germany demonstrated that 1 pound of nitrogen applied to the soil increased the yield of wheat one-third of a bushel. Now, that is a not very good general statement to apply everywhere, but under their conditions they found that 1 pound of nitrogen added to their soil increased the yield of wheat one-third of a bushel.

The CHAIRMAN. Fifteen pounds?

Mr. BOWER. No, sir; 20 pounds.

The CHAIRMAN. Yes; 20 pounds.

Mr. BOWER. Now, 1 pound of nitrogen in commercial fertilizer costs the farmer to-day about 30 cents a pound, so you would have to be securing over \$1 a bushel for wheat before you were sure you were going to get any economic return on the labor and freight and hauling, and the application of that 1 pound of nitrogen under the wheat at 30 cents a pound.

The CHAIRMAN. Oh, yes; and you would have to be sure that you did not have a hailstorm and did not have a drought.

Mr. BOWER. Exactly so.

Mr. Bowser. Mr. of that. If they get the United States.

The CHAIRMAN than your wisdom is not any way mentioned the Federal Trade but I realize it is not any way mentioned by the Federal Trade Commission. They are liable to enter into the execution of the law. We believe over the world.

Mr. Bowser. The execution of the law. We believe over the world.

The Mr. T. a per

you did not have the rust or anything else.

so. But if you could get it for 5 cents or 10 cents a pound, he wheat, because you would take that risk, and your increased iron on the investment. Fertilizer is of no value to the farmer crop over what the crop would be without fertilizer enough to the labor of applying it, and give him a profit. It has got to do not use it. He will stop right there.

have to use it on our eastern soils is that if we do not put fertilizer we no crop; so that the addition of an application of 200 or 300 fertilizer makes a crop, and without it we get nowhere.

you could eliminate that useless material that the farmer is profit on his crop would be greater, would it not?

elimination of all the useless material would mean an increase of food in the fertilizer and a lower cost. As I say, you can not. You have got to do it at one jump. You have to jump the creek with fertilizer compounds at one jump.

hereby reducing to the farmer the cost of production?

lutely so. That would naturally follow. We have had a great out whether Mr. Ford can make this half-priced fertilizer. We under the cyanamid process, if you make ammonium phosphate, ton of ammonium phosphate from that plant, carrying 20 per cent per cent of acid phosphate. we would not have to pay freight, dealer's profit, and all of those other things on over 5 tons of the fertilizer.

on with a representative of the fertilizer interests, and he was the one of the largest fertilizer companies in the United States, and he at of \$30 per ton of 3-8-3 \$10 is freight, and you can see from that to get our half-price fertilizer.

it is another large source of nitrogen fertilizer in this country, economic waste—that it should be put on the ground. It is more for cattle and feed for sheep than it is as fertilizer, and especially when you realize that when it is fed to cattle the return in 5 per cent of the actual fertilizer elements that were in the cost start with. Only 25 per cent is digested and retained by the is fed to them, so that to put cottonseed meal into the farm with-through live stock is an economic crime. Some farmers still in- ne of it still has to be used because of the inadequacy of the sup- ners have used it for years, and they still want cottonseed ferti- u take your fertilizer compounds and put them down here at a t will switch to the live-stock industry, where it belongs, economi- ently.

DRICK. Have you any figures to show what proportion of the cot- produced is used for fertilizer and what proportion of it is used

Yes. I have not those figures with me, but I will insert them in have that material at the office.

DRICK. Very well.

regate, two-thirds of the cottonseed meal was used as feed and fertilizer.

"I believe, therefore, that the best way in which I can contribute something of possible value to your deliberations is to confine myself in the main to what is possibly the most important single difficulty the farmers of this country face in the matter of fertilizing their crops, and the most effective single remedy therefor. I refer to the always high and frequently prohibitive cost of the nitrogen fertilizer as the difficulty and to Government cooperation in the establishment of nitrogen industry within the borders of the United States as the remedy."

Then he goes on to say:

"The answer to the fertilizer problem, to be of any practical and immediate value, must lie in revolutionizing present conditions instead of a slow evolution proceeding under their domination."

I want to refer back to that last statement a little later.

Then, with that situation, the question resolved itself into what can be done, as Senator NORBECK stated. What assurances have we got? What have we got on which to base our belief that development and operation of this plant will result in lower-priced nitrogen?

In testifying on S. 4971 before this committee of the Senate on March 16, 1916, Mr. Washburn stated, on page 5:

"What has been obtained, economically speaking, is this: That the factory costs (that is, of cyanamid) under most favorable conditions, those which are not only theoretically obtainable, but actually obtainable in some parts of the world, everything, including overhead and superintendence and all that sort of thing inside the factory, but not including interest on investment, for producing nitrogen, comparable to the nitrogen that is in the Chilean nitrates is about one-third of the ordinary market price of the Chilean nitrates.

"Senator SMITH of South Carolina. You mean to say that the factory cost is about a third of the selling cost?"

"MR. WASHBURN. Of the selling cost of Chilean nitrate."

Senator NORBECK. He meant there, if I understand the point you are trying to make, that the cost of the investment was the larger cost of the fertilizer?

Mr. BOWER. No. This was factory cost. He was giving the factory cost without including the interest on the investment, because previously we did not have figures as to what the plant investment would be.

Senator NORBECK. Is he the same man who testified before this committee?

Mr. BOWER. Yes, sir; in 1916.

Senator NORBECK. Do you mean this man who testified a week or so ago?

Mr. BOWER. That was Mr. Hammitt, representing the same corporation.

Senator NORBECK. His testimony was that they were practically shut down because they were unable to produce nitrate that would take care of their overhead. They shut down and not only failed to pay dividends, but failed to pay operating expenses, and it was for that reason they shut down.

Mr. BOWER. There are some interesting features in regard to that.

Senator NORBECK. He took the position before this committee that if costs could be reduced it would be decidedly to their advantage to run without a loss rather than to stand still and have a loss.

Mr. BOWER. Sure. There is no question about that.

Senator NORBECK. But they found themselves unable to do so; therefore they have that big investment standing idle.

Senator KEYES. Mr. Bower, does the witness whom you quoted there state what countries he refers to as "some foreign countries"?

Mr. BOWER. Yes; and he goes on and explains that this favorable location, etc., is the Muscle Shoals location. He was testifying on the Muscle Shoals development at that time before this same committee.

There appeared before this Senate committee in 1916 Doctor Baekeland, one of the great independent consulting chemists of the country, and on page 113 of hearings on S. 4971 he says:

"The statement is made by the present Government monopoly in Germany that: after the war is over and after what they know now about the synthetic manufacture of nitrogenous fertilizer from the air, after all the experience they have acquired during the war while making nitric acid, that they will be in such condition that they intend to furnish to the farmers of Germany nitrogen fertilizer at about one-half the price it is costing the consumer here in the United States. If Germany can do that, gentlemen, there is not the slightest doubt in my mind that we can do the same here or that we can do better."

As confirmation of the fact that Germany is doing that I have here a brief prepared by the Koppers Co., of Pittsburgh, Pa., designers and builders of by-product coke and gas oven plants, one of the largest designers and builders of by-product coke oven plants, asking for protection on ammonium sulphate in the tariff law. One

of the reasons why they ask for protection by legislation was the German nitrogen fixation plant.

The CHAIRMAN. Who is that?

Mr. BOWER. The Koppers Co.

The CHAIRMAN. Who was testifying there?

Mr. BOWER. This is a brief prepared by the Koppers Co. and argument in support of a duty on ammonium sulphate and ammonia products.

The CHAIRMAN. What company is that?

Mr. BOWER. The Koppers Co.

The CHAIRMAN. Yes.

Mr. BOWER. That is the largest—well, now, I am not sure whether it is the larger of the two great companies in this country who design and direct and operate under contract the great by-product coke ovens.

The CHAIRMAN. They made their product from the coke?

Mr. BOWER. Yes, sir; from coking coal, and they are asking protection in the present tariff bill on ammonium sulphate, their nitrogen product, against German air fixed nitrogen into this country.

The CHAIRMAN. Can you tell us whether they succeeded in getting the committee to put a tariff on it?

Mr. BOWER. They succeeded, Mr. Chairman, in the House committee, without a hearing, in securing \$12 duty a ton on ammonium sulphate in the bill as it passed the House.

The CHAIRMAN. What did the Senate do?

Mr. BOWER. The Senate, after we had made a vigorous fight against any duty on ammonium sulphate, have reported it out with a duty of \$5 a ton on nitrogen.

They cite, as one reason why protection by tariff is needed, that—

“The cost of operating these plants is relatively low, so that even to-day sulphate of ammonia is being sold in Germany at half the price in the United States, based on the present rate of exchange.”

The CHAIRMAN. Of course, that is very proper evidence and I am interested in it, but they were asking there for a tariff.

Mr. BOWER. Surely.

The CHAIRMAN. Like most of these people who are asking for a tariff on their products, it is known and considered that they are vitally interested in it, and their testimony must be weighed accordingly.

Mr. BOWER. I appreciate that, but that is the testimony, and why it is so interesting to us is that it is the testimony of the opposition who come here and tell us that they can make all the ammonium sulphate we need, and that we do not need to operate the Muscle Shoals plant, and they have gotten out briefs, and I have copies of their propaganda, in opposition to the Muscle Shoals plant, saying that they can furnish us all we need at any price we want it, and then they come here and ask and get \$12 a ton duty on the ammonium sulphate in the House, and they have got \$5 a ton as it stands in the Senate to-day.

The CHAIRMAN. I think we are all agreed that there should be operation of Muscle Shoals, but we disagree on how to do it.

Senator HEFLIN. If they get this duty that they ask for it will increase the price of fertilizer to the farmers, won't it?

Mr. BOWER. I should think there could be no question about that and, furthermore, as I see it, with the only competitor in the ammonium sulphate industry in this country to-day being Chilean nitrates, and Chilean nitrates having a price fixing arrangement of their own and a distribution arrangement of their own, the Chilean Nitrate Association would immediately take advantage of the duty on ammonium sulphate and raise the price of Chilean nitrates accordingly.

The CHAIRMAN. That means they would increase the export duty?

Mr. BOWER. Well, I don't know whether they could do that, for this reason, that they would have to increase the export duty generally. But the Chilean association could raise the price of Chilean nitrates in this country.

Senator HEFLIN. In order to meet the price advance by this other concern?

Mr. BOWER. Exactly so.

Senator HEFLIN. Which would make the price to the farmer of a ton of fertilizer higher than it is to-day?

The CHAIRMAN. I have an idea that they would increase the export duty.

Mr. BOWER. They have the difficulty there that their whole exports are not coming to this country.

The CHAIRMAN. I know, but most of them do.

Mr. BOWER. Well, I don't think, Mr. Chairman, that quite 50 per cent does come to this country.

The CHAIRMAN. Does it not?

The CHAIRMAN. Or your organization did.

Mr. BOWER. In the testimony here last year; yes, sir. We appeared before this committee last year, asking for that S. 3390.

The CHAIRMAN. But you are opposed to it now?

Mr. BOWER. Well, we did not have the Ford proposal.

The CHAIRMAN. No; that is true.

Mr. BOWER. And Government operation—

The CHAIRMAN. You had a right to do that; I am not criticizing you at all.

Mr. BOWER. Government operation was the only thing offered to us. The farmers united, I think, in a joint appeal—the grange, the farmers' union, and the farm bureau—to the House of Representatives, asking for a hearing; I know they did, the representatives of every one of those organizations, and the national board, the National Grange, the farmers' union, and the farm bureau signed a joint appeal that went to every member of the House of Representatives asking for a hearing on this 3390.

The CHAIRMAN. That was a Government operation bill?

Mr. BOWER. That was a Government operation bill.

The CHAIRMAN. You were all in favor of it?

Mr. BOWER. We could not get a hearing before the House, and this proposition is before the same committee of the House to-day that refused to grant us a hearing even last year.

The CHAIRMAN. Please answer my question. All of these various interests were in favor of it, then?

Mr. BOWER. Yes, sir.

The CHAIRMAN. The Senate passed the bill, did it not?

Mr. BOWER. Well, the farmers would have gotten mighty little out of S. 3390, as it passed the Senate. As it passed the Senate it was not a farmer's bill.

The CHAIRMAN. I agree with you, and I think it should have been amended, and I tried to do that in this bill. Don't you think that this bill is a vast improvement over that?

Mr. BOWER. Well, S. 3390, as introduced, was not just the bill as it was passed by the Senate.

The CHAIRMAN. That is what I mean.

Mr. BOWER. That is where the interests came in and blocked everything that we tried to put in that bill.

The CHAIRMAN. What difference does it make—

Mr. BOWER. I never could quite understand the friends of that bill—who took credit for the passage of it in the Senate—because of the form in which it passed the Senate as there was very little left in it for the farmer.

Senator HEFLIN. But it could not be passed in any other way. We had hoped that in the conference with the House it would be amended.

The CHAIRMAN. Well, sometime before you get through, Mr. Bower, I wish you would take up this bill which is pending before this committee and discuss it and give out your ideas about it.

Mr. BOWER. The thing we see, is just the impossibility of getting it passed.

The CHAIRMAN. Oh, yes; that may be.

Senator HEFLIN. Just give him your frank opinion about it—that is what he wants.

Mr. BOWER. My opinion is this: With the interests that are opposed to the fertilizer developments at Muscle Shoals by Government operation, by Ford, or by anybody else, if you add and superimpose upon that the general opposition by the great body of the Members of the Senate and House to Government operation in any form, you have defeated the bill before you have started to advocate it.

The CHAIRMAN. Don't you think that in this bill that is introduced here the corporation that is set up is completely and entirely removed from any of the evils that are always alleged against Government operation of anything?

Mr. BOWER. We thought S. 3390 also was.

The CHAIRMAN. Well, I did not think so. I thought there were lots of loopholes in that myself, and if I had not been sick at the time I would have introduced a substitute, something like I have done here, at that time.

Mr. BOWER. I do not think it is a question of the form that Government operation takes. It is the conscientious objection of men who are actual friends of the farmers who are opposed to Government operation under any condition.

The CHAIRMAN. That is what this bill is intended to do, to meet those objections. I introduced the same kind of a bill to control the railroads, and I

remember distinctly several men who were bitterly opposed to Government operation, after they had examined into it were very much in favor of it. Now, when you speak of Government operation of a plant ordinarily, without looking into the form of it, lots of people are opposed to this who would favor it if they looked into it and saw that there was organized there a corporation that would be just as free from the evils, such as partisanship, as a private corporation would be, and I think more so, because the special interests that might get behind a private corporation with sinister motives would not have an opportunity to get behind this corporation. But it is a tentative plan, and now from you, who are representing a large farmers' organization, I would like to have it criticized or condemned, if you think it should be condemned. If there is any way to improve it, let us find that out. I would like to have some constructive criticisms, if there are any, that can make it into a good bill. In other words, I want it to get through the crucial test.

Mr. SILVER. Senator, if we may complete this testimony——

The CHAIRMAN. I say, I do not want you to do it now, unless you want to do it. Do it whenever you want to.

Mr. SILVER. We will be very glad to take your bill up and make a detailed report on it.

The CHAIRMAN. All right.

Senator HEFLIN. Now, Mr. Bower, Senator Norris asked you about supporting other bills, and you stated that you could not even get a hearing on that bill. Of course, that proposition had to be abandoned, and you could not get any bill then. Then when Henry Ford's offer was made you thought and you still think that your only hope to get relief from the Fertilizer Trust and to get an additional supply of fertilizer is through this Ford offer; is not that the case?

Mr. BOWER. That is my belief, absolutely. The farmers' union has indorsed the Ford proposal by a resolution at the last annual convention. The farm bureau indorsed the Ford proposal at their convention, and also reserved the right, if that proposal is rejected, to insist upon a Government-owned corporation. We do not intend to lose the opportunity to Muscle Shoals if we can help it; but we see in the Ford proposal a solution, through private industry, of the difficulties that we met with in that development.

The CHAIRMAN. Is not that mainly because this is Ford and not because of what is contained in it?

Mr. BOWER. So far as the commercial proposition is concerned, no, Senator. There will be a safeguarding of fertilizer production through this board. Of course, Mr. Ford may have a stroke of apoplexy and die to-morrow, but we figure that this thing gets started; this board of farmers is appointed; a certain program and a certain definite plan of operation are inaugurated; and the farmers will be cooperating with Mr. Ford not only to reduce the cost of production but the cost of distribution. Under this contract the farmer has a right to go over the heads of these middlemen that have been between us and the fertilizer in the past to the source of the manufacture of these ingredients, through our cooperative organizations.

Now, the board will be selected, appointed, and confirmed by the Senate, and we will sit in with Mr. Ford and start this plan. If Mr. Ford dies and this corporation, as you said, may get into the control of some antagonistic group, the moment they change the procedure and method at that fertilizer plant which was started by Mr. Ford you would have an appeal from that farmers' board to the Federal Trade Commission, and there will be an appeal from the farmers of the country to Congress on it.

The CHAIRMAN. All right; then they would have to get back to some Government corporation similar to the one I have set up here now. That is what they will be up against. I think that is probably just what would happen.

Mr. BOWER. Or a ruling issued permitting the company to do certain things or there would be a cancellation of the contract.

The CHAIRMAN. I think if you are fair you will have to admit that if this corporation to whom you are going to deed some of this property and lease the balance of it would come under the control, through the sale of stock or in any other way, of interests that were opposed to the proper development and the manufacture of cheap fertilizer, it would be a failure? It would be a failure if that happened, would it not?

Mr. BOWER. I do not think there is any question about that. I agree with you on that.

The CHAIRMAN. That is the Ford proposition.

Mr. BOWER. I think you have protection there against that in your board and the provisions for that board. Now, I am not a lawyer, but under that contract that board is provided for, and it starts out in order that the farmer may secure cheaper fertilizer, etc.; and I believe the authorities would determine the action under that proviso with reference to the board's powers.

The CHAIRMAN. Well, as I look at it, if that board were operating under an unfriendly corporation, the board would be as powerless as you would be to defend themselves against a stroke of lightning in a thunderstorm.

Mr. BOWER. There is one thing about the present fertilizer combinations and mixtures that are furnished the farmer to-day that I would like to call your attention to. For instance, take 2-8-2 and 3-8-3. Neither of those combinations are a balanced ration for the plant or a balanced fertilizer for the plant. They were so designated by Mr. McDowell in speaking before the House Military Affairs Committee—that these combinations were what the farmers were using and they were balanced. They are balanced on the basis of the cost of materials but not on the basis of the plant's requirements. That is the trouble with them.

For instance, take the food requirements of wheat, corn, oats, alfalfa, and clover. Thirty bushels of wheat require 35 pounds of nitrogen, 15 pounds of acid phosphate, and 9 pounds of K_2O ; corn, 75 bushels, 68 pounds of nitrogen, 29 pounds of acid phosphate, and 16 pounds of potash; oats, 60 bushels, 40 pounds of nitrogen, 16 pounds of acid phosphate, and 11 pounds of potash; alfalfa, taking some of its nitrogen from the soil and some from the air through its bacterial action, 4 tons, 180 pounds of nitrogen, 43 pounds of acid phosphate, and 178 pounds of potash; clover, 2½ tons, 103 pounds of nitrogen, 20 pounds of acid phosphate, and 82 pounds of potash.

So you see, in all of these typical crops the nitrogen requirements of the plant overbalance the acid-phosphate requirements of the plant to grow, and yet in our commercial fertilizer the acid-phosphate elements overbalance our nitrogen elements, and it is simply that they can put in 8 pounds of acid phosphate, under the present prices per unit of plant food, where they can only put in 100 pounds 2 pounds of nitrogen and sell it to the farmer, because 2 pounds of nitrogen costs them about 15 cents a pound, or about 30 cents to put it in there. Eight pounds of acid phosphate only costs them about 4 cents a pound. So that they do not balance these fertilizer combinations on the basis of plant food requirements, but on a combination that they can sell to the farmer.

The CHAIRMAN. Whenever you get to a good stopping place, we will take a recess, Mr. Bower.

Mr. BOWER. I will be finished in a few minutes, Senator, unless there are some further questions.

The CHAIRMAN. All right.

Mr. BOWER. We, as I say, have reached the conclusion that the Ford proposal and his method of manufacture of the fertilizers and his method of distribution as proposed in his contract, together with the guaranteeing of 110,000 tons of ammonium nitrate per annum, which does not mean ammonium nitrate, but which means 40,000 tons of ammonia in commercial fertilizer combinations, is the best offer that is presented to the farmer to-day that we have any hope of securing, and we fear that every delay will simply strengthen the opposition. We think the interest in the Muscle Shoals development will pass, and we will lose out completely, and it will get into the hands of the private interests that have been trying to get it into their hands all the time.

So, as I say, the Farm Bureau asks the acceptance of the Ford proposals.

The CHAIRMAN. Are there any other questions that any of the members of the committee wish to ask Mr. Bower?

Senator HEFLIN. I just want to say, Mr. Chairman, that Mr. Bower states that his organization of farmers inforces the Ford offer.

Now, Mr. Bower, do you feel that if Mr. Ford gets this Muscle Shoals property he will use it to the benefit of more people than it would be if operated under the control of anybody else? Do you feel that way about it?

Mr. BOWER. Anybody else who has made any proposal for it.

Senator HEFLIN. Yes; but don't you feel that the Ford offer is the only one of the offers that holds out to the farmers of the country any prospects for cheaper fertilizers?

Mr. BOWER. Absolutely.

Senator KENDRICK. Would it suit you as well, Mr. Bower, to have the plant continued in operation by the Government, plant No. 2, if the Government com-

pleted the dam and retained control of it, and then proceeded to operate plant No. 2 to something like full capacity in the manufacture of nitrates? Would it not suit the farmers equally as well as if it were in the hands of the captains of industry or in the hands of the commercial interests?

Mr. BOWER. Well, take this situation, Senator Kendrick: For this phosphorus production that I spoke about you have no plant down there. As to the successful demonstration, such as Mr. Swann could give the committee, I believe if you would have him come here, as he did before the House committee, or as Doctor Whitney would testify to, that the phosphoric acid production in the electric furnace would be successful and would be cheaper and would make these high compounds, 40 or 50 or 60 per cent, would require a phosphoric acid reduction plant at Muscle Shoals. Then you would have a real opposition to the Government making any such investment.

In your nitrogen fixation, as I stated, you have no primary industry in this country engaged in producing nitrogen, but you have capital invested all over the country in the production of acid phosphate and in sulphuric acid methods of producing this. If Mr. Ford found that should be advisable, he himself would make the investment in the phosphoric acid plant.

Senator KENDRICK. Yes; my idea is, though—

Mr. BOWER. The difficulty is the securing of the necessary additional appropriations. The Muscle Shoals horsepower development requires \$50,000,000, according to the engineers, and if you are going into the different branches of the Tennessee River and equalize that power probably \$15,000,000 to \$20,000,000 on top of that, and then your Haber process and your own testimony is \$3,000,000 on that. As to the cyanamid plant, a good many people say it will not work, but I believe it will, but I do not know about your phosphoric end of it. I do not know what it will cost.

Senator KENDRICK. But I understand that even with Ford's proposition the Government is to finish Dam No. 3.

Mr. BOWER. Under the proposal that Mr. Silver explained yesterday there would be an issue of bonds by the Government to carry that out, in which case Mr. Ford would pay interest on the bonds and retire the bonds by his amortization fund, so that it would require no appropriation from the Treasury.

Senator KENDRICK. Yes. Well, it has occurred to me in connection with the manufacture of these different products, the country seems to be very well supplied with every kind of product that enters into the manufacture of fertilizer, except nitrogen. You have stated that a number of different companies are producing different kinds of fertilizer, but it occurs to me that, even through Government operation or in any other way, that if we supplied this one commodity needful the natural laws of trade and business would take care of the others.

Mr. BOWER. Well, you would have this difficulty, that a great deal of the farmer's fertilizer—not all, but a large proportion of it—is a mixed combination of nitrogen and phosphorus compounds, and under your suggestion the nitrogen would have to go to the mixers, and on up through, and that is one of the things we were fearful about last year.

Senator KENDRICK. Is it not reasonable to suppose that if the Government were operating this plant they would be as diligent about accepting or adopting any improved methods of manufacture as individuals or corporations would?

Mr. BOWER. You may assume that.

Senator HEFLIN. But these fertilizer people who are now fighting the Ford offer would fight it just as hard if it came from the Government?

Mr. BOWER. Any time there would be a development of a new process we would have to have the game fight about giving an appropriation, unless the corporation was earning enough to make the investment itself, and in the case of the phosphoric-acid plant we would probably have a bitterer fight, because we would have a more actual American industry that this would compete with.

The CHAIRMAN. Is that all you have now?

Mr. BOWER. That is all, if there are no further questions, Mr. Chairman.

Senator HEFLIN. The people you represent are anxious to have this matter acted upon as early as possible, are they not?

Mr. BOWER. You do not know how vitally interested we are in that because in a delay we see the failure of the whole proposition. The opposition is growing and strengthening, instead of the influence of the proponents growing, I am afraid.

The CHAIRMAN. I am afraid you are mistaken about that. We were defeated before. There was a committee of the House that went down there

and investigated it, and they reported back, as I understand it, that they wanted to let the Government scrap everything, let everything go and lose all the money that was put into it. Now, since it has started up, I think it has convinced everybody that has been connected with it that no matter what we may decide as to what shall ultimately be done with it, we must go on and finish that dam.

Mr. BOWER. Why, Senator, you could get an appropriation to finish that water power, if you divorced the operation of that fertilizer plant from it, in 20 minutes in the House and Senate both, if the people that voted for it knew that the fertilizer plant was not going to run. The whole crux of the thing is in that fertilizer plant. These power companies would come in at any time and advocate the building of that power dam.

The CHAIRMAN. If that is true, then you ought to unite on getting that appropriation and start on the work right away.

Mr. BOWER. But, Senator, any farm organization can not advocate that appropriation, unless tied into it is the legislation that requires the operation of that plant.

The CHAIRMAN. Now, Mr. Bower, you are the first one that I know of—

Mr. BOWER. I am giving you my personal opinion, and what I would recommend to the farmers. I do not know that Mr. Silver would agree to it at all.

The CHAIRMAN. I do not think you would say that if you weighed your words, because, no matter what we want to do, it is a physical impossibility to get any plan through here outside of a direct appropriation to continue the work any time within the immediate future—no matter what we want to do. Let us not deceive ourselves; we do not get anywhere by making ourselves believe something that we know is not true.

Senator HEFLIN. One of the obstacles, according to Mr. Bower, is this, that these other concerns who are now fighting the Ford offer would be willing to have the dam completed if you divorced it from any idea of making fertilizer.

The CHAIRMAN. Oh, yes.

Senator HEFLIN. And if it could be completed without the understanding that it would be used for making fertilizers, then they would use their influence in keeping it for their own use, according to Mr. Bower's statement.

The CHAIRMAN. No; his language is plain. He said he was opposed to any appropriation for carrying on any of this work—

Mr. BOWER. No; to complete it.

The CHAIRMAN. Unless coupled with it—

Mr. BOWER. To complete it.

The CHAIRMAN. Oh!

Mr. BOWER. I am not referring to that other proposition, but I say if it was completed by appropriation from the United States Treasury without legislation for the operation of the nitrate plant they never will get the operation of the nitrate plant.

The CHAIRMAN. Let us see that we do not misconceive what you said in the record here, so that it will not be used against this appropriation. This committee has directed me—

Mr. BOWER. I appreciate that.

The CHAIRMAN (continuing). By a unanimous vote to offer an amendment to the military affairs appropriation bill, which will be in the Senate now within the next few days.

Mr. BOWER. I see your point.

The CHAIRMAN. To continue the work.

Mr. BOWER. Of course, \$7,500,000 won't finish it.

The CHAIRMAN. Oh, no; we do not expect it to. Are you opposed to that?

Mr. BOWER. No, sir.

The CHAIRMAN. Then that is clear.

Senator HEFLIN. You want to see the dam completed and work begun on it?

Mr. BOWER. If you complete it without legislation, then it is our fight alone. They will say it is a wonderful power, and it should not be used for the manufacture of fertilizer.

Senator HEFLIN. And after this power is provided what you want to see is to see that it is used in the manufacture of fertilizer?

Mr. BOWER. Absolutely.

Senator HEFLIN. That is your position?

Mr. BOWER. Absolutely.

Senator KEYES. That is, the only way of getting it through is to complete the dam, to make the appropriation now?

The CHAIRMAN. Surely.

Senator KENDRICK. There is another thing on which I want to be quoted here, which I think is highly important, so far as I am personally concerned. I am now and have been right along agreeable to action to make any final arrangement with Mr. Ford that will have his stamp of good judgment and common sense in connection with the manufacture of fertilizer and the operation of that dam after it is built, but there are two points which I am unwilling to go along on, and I never will go; and one is to turn over that power in the form of a monopoly to Mr. Ford or to anybody else. I do not believe that we ought to tie it up for a long period of time, and I do not believe that any Member of Congress who has the best interests of the country at heart will agree to that form of monopoly any more than any other kind. That is the thing we have been trying to fight right along.

The CHAIRMAN. We will adjourn here until to-morrow morning at 10.30 o'clock.

NOTE.—Mr. Levering's statement following was made on May 5, 1922, and is here printed to preserve continuity of his presentation.

STATEMENT OF MR. J. H. LEVERING, CIVIL ENGINEER, LOS ANGELES, CALIF.

Mr. LEVERING. My name is J. H. Levering; I live in Los Angeles, Calif.; I am a civil engineer; I have been in the practice of the profession for about 30 years or over; I have visited Muscle Shoals before the work shut down in June of last year, and I have visited it since, for the purpose of investigating the project for putting in a bid for two different clients. I am appearing in this case simply as an American citizen, to give you the benefit of any information that I may have.

The CHAIRMAN. Well, we are glad to have that kind of a witness.

Mr. LEVERING. If you would let me, I will answer a question that has been asked, two times that I know of—"why the Government engineers could not build the thing as cheap as private engineers?"—and I want to answer it. It is not because the Army engineer is not a competent man or because he is not trustworthy, or anything like that. They are as good a class of engineers as you will find anywhere. Of course, some of them are not equal to others. The reason is that the private engineer may have had experience in a certain line of work, and he knows ordinarily what equipment could economically handle that work. The Army engineer has got to investigate that and get that information together before he can go to work. It is out of his line. He is educated as a military engineer.

In the case of Dam No. 2, that equipment is already on the ground. That part is all over with. It has cost the Government a good deal of money. A private contractor could have moved his equipment in and gone to work quicker than the Army engineers did; but he is there, and the equipment is there, and it is doing good work, and with that equipment the Government can do the work cheaper than you could get a private contractor to do it. I have watched them carefully. That man you have there—his name is Colonel—

The CHAIRMAN. Colonel Barden?

Mr. LEVERING. Colonel Barden. He is an exceptionally good man. He is in a line of business that you could hardly expect him to develop as quick as he did in that line of work. I was surprised to find it. It is conscientious work and as good work as I ever saw.

They have got 30 locomotives on 28 miles of track. That is more than a private engineer would put on that amount of track. But the Ordnance Department was building the buildings at the same time the Engineer Department was building the dams, and they duplicated their construction.

The CHAIRMAN. How many engines did you say?

Mr. LEVERING. Thirty engines when I was there, and they are all in good condition, too.

Senator KENDRICK. Twenty-eight miles of track?

Mr. LEVERING. Twenty-eight miles of track; yes. But they were in a hurry.

The CHAIRMAN. I don't think there were that many there when they quit work, were there Major?

Major BURNS. Twenty-eight miles of track?

The CHAIRMAN. Yes.

Mr. LEVERING. There were at the time I was there.

Major BURNS. No; I don't think so. I will check that up.

The CHAIRMAN. I think you are right on the mileage of railroads. They connect with both railroads on each side of the river.

Mr. LEVERING. It is good track. It is all 80-pound steel; and is good, first-class track.

The CHAIRMAN. It seemed that way to me.

Mr. LEVERING. It is better than I would have put in.

Senator NORBECK. Do I understand you to say that the unusually large number of locomotives resulted from the purchase by two different governmental departments working without coordination?

Mr. LEVERING. Yes; that is all. There was no scheme there, no rivalry, or anything like that.

Senator NORBECK. They had just bought a lot of stuff they didn't need?

Mr. LEVERING. They needed them at the minute. They were in a hurry. The Ordnance Department was working on these buildings and the engineers on the dams; and it looks now, when you see them all working on the dams, as if they have got more than they need.

The CHAIRMAN. They have got 76 cars, I believe.

Mr. LEVERING. One hundred and thirteen, all told; the dump carts and all.

The CHAIRMAN. I was speaking of the cars at the dam.

Mr. LEVERING. They have got 113, including the dump cars.

The CHAIRMAN. Of course, there may have been more when you were there.

Mr. LEVERING. Yes.

The CHAIRMAN. When were you there?

Mr. LEVERING. I was there in June, I believe it was about the 1st of June.

The CHAIRMAN. That was a good while before we were there.

Mr. LEVERING. They were working when I was there. Altogether they had that many cars, dump cars and freight cars. It is absurd to say that anybody could take that equipment and cut that price very much. If he did, he would not be doing as good work as that man is doing. That man is doing good work.

Senator KENDRICK. And they certainly could not improve on the quality of the work?

Mr. LEVERING. No; they could not. I don't think so. I never saw a better piece of work done than that is in my life, and I have seen quite a good deal of it. That work is all right. I am not an Army engineer, and I am not very favorable to them, but that man is all right.

The CHAIRMAN. You say you are not an engineer?

Mr. LEVERING. Not an Army engineer, I say.

Senator NORBECK. The subject was opened up here, and we are discussing Government engineers, and I want to say that what little I saw down there I was well pleased with, but speaking of the experience of different engineers in different lines, I suppose that a man in private work has certain advantages of training that an Army engineer does not get.

Mr. LEVERING. Yes. You can get him to work quicker.

Senator NORBECK. And would it not be fair to assume that the man who has got in the habit of depending a great deal on the balance sheet, on making both ends meet, on filling the bill, gets a line of thought into his work that a man does not who has always been on a salary?

Mr. LEVERING. That is right, too.

Senator NORBECK. As a rule.

Mr. LEVERING. But that piece of work, a man couldn't beat that, the way it is being done.

Senator NORBECK. The quality of the work.

Mr. LEVERING. And its cheapness, too.

Senator NORBECK. Do you mean to say that the sixteen or seventeen million dollars that have been put in there have shown big results?

Mr. LEVERING. He has got more in equipment than I would have; but from now on, after the equipment goes in—that was charged up to that work—

Senator NORBECK. From now on, but at the beginning, you would have made certain changes, and there are some advantages that private engineers would have gained from planning, and such as that?

Mr. LEVERING. Yes, sir.

Senator HEFLIN. Do you think at the time this dam was put in, that part of it that had been completed, that private enterprise would have saved very much money on it, considering the rush and the fact that it was being built to meet the demand of war, and all that?

Mr. LEVERING. I don't believe it would very much. You must remember this, that these men were on salary. They were brought there, as they told me, and taken away quickly, and another man took his place, and they didn't really have a chance. It was not a case of ability; it was a case of hurry. I don't believe

that under those circumstances anybody could have done much better, but it has cost more to get the start, to get the work going.

Senator NORBECK. I was grieved over a few things I saw there, but they gave me such very plausible explanations, which is the easiest thing in the world to do. For instance, more than a million dollars worth of electric equipment that has laid there for two years and would not be used for two or three years more, that could now be purchased for one-half of what was paid for it at that time.

Mr. LEVERING. That is right. But that is because of the rush, and these men came there and took hold of the first thing they saw.

Senator NORBECK. I don't believe a man spending his own money would be liable to make that kind of mistakes, do you?

Mr. LEVERING. No. But these men came there in a rush and took hold of the first thing they saw.

Senator HEFLIN. Your position is that private enterprise would be able to do the work quicker than the Government?

Mr. LEVERING. If he starts from the ground up, yes; because he is trained to get equipment for that line of work.

Senator HEFLIN. Mr. Ford claims if they would turn over this dam to him down there and let him construct it under his supervision he will push it along to early completion and do the work cheaper than the Government. Do you think he can do it?

Mr. LEVERING. I don't know what experience he has had in this particular line of work. If he has not the necessary experience he will be like the Army engineer; he has got to practice.

Senator HEFLIN. Don't you think he would get the best engineer and the best help that there is?

Mr. LEVERING. I don't know. He never got me, so I don't think he has gotten them.

Senator HEFLIN. Well, he didn't get one of the best, then. If he should get you you think he would be able to do it much cheaper than the Government would do it?

Mr. LEVERING. I could not finish that Dam No. 2 a bit cheaper than the Government could. I admit that.

Senator HEFLIN. You could not?

Mr. LEVERING. No. I could not take Dam No. 2 now and finish it up any cheaper than the Government could.

Senator NORBECK. Partly because the Government has got the equipment on the ground?

Mr. LEVERING. Yes. And these men that are there—I don't know who the other man is that is helping him, but they are all right. I take off my hat to them all the time. We are just talking along here, and I don't want to criticize anybody, but I am just giving you a few little illustrations that struck me. If I was going to build Dam No. 1 down there I think I could beat the Government engineers quite a good deal, and this is the way I would do it: Here is Dam No. 2, about 95 feet, we will say, high. Then the ground drops down here until you have to put up Dam No. 1, which would be about 12 feet high, to get the back water, to get navigation to the foot of Dam No. 2. If you were to open a navigation channel to Dam No. 2 and use that rock—it is a rock-bottom river—and put that rock into Dam No. 2, you would save that. It costs you more to get the rock into the dam, but what you save on the opening of the channel would make that cheaper than it would be to build Dam No. 1.

The CHAIRMAN. You mean to build Dam No. 1?

Mr. LEVERING. Build Dam No. 1, yes. Then you add about 8 per cent to the efficiency of Dam No. 2. You have that much more of a drop.

The CHAIRMAN. In other words, instead of spending the money to build Dam No. 1, you would spend it to excavate a channel from Dam No. 2 down to where Dam No. 1 would be built?

Mr. LEVERING. Yes. I would do that if I was doing it right now, because I could put that rock back in Dam No. 2. There is a million yards to go into Dam No. 2 yet. If it was not for that, I couldn't do it.

The CHAIRMAN. Have you ever estimated what it would cost to take that rock out that it would be necessary to excavate? That would be about how many miles?

Mr. LEVERING. It is about 2 miles, I think.

The CHAIRMAN. I think it is 3.

Mr. LEVERING. I think it is about 4,000 yards.

The CHAIRMAN. Do you know, Major?

Major BURNS. I could not answer that, but I should guess it is about 2 miles.

Mr. LEVERING. I think so, but I think about 4,000 yards.

The CHAIRMAN. You would have to excavate practically the whole distance?

Mr. LEVERING. I estimate that rock taken out of there at \$4, and it is worth over \$2 in Dam No. 2, and by taking that up and charging it back to Dam No.

1—

The CHAIRMAN. You use that material and put it right into the dam?

Mr. LEVERING. Yes. But I couldn't do that after the dam was finished.

The CHAIRMAN. I understand. You have to do that now if you do it at all?

Mr. LEVERING. Yes, you would have to do it right now.

The CHAIRMAN. I never thought of that before, but it seems to me that is a very good suggestion for the engineers to consider, and of course if you did that you would add to the efficiency of the dam, because you would not be bothered with the tail water there.

Mr. LEVERING. No; and your extra fall would pay interest on your money all the time.

The CHAIRMAN. And you never would be to the expense of keeping up the lock in that Dam No. 1?

Mr. LEVERING. No, you never would.

The CHAIRMAN. You would eliminate that entirely?

Mr. LEVERING. And that tail water would keep that channel open, too.

The CHAIRMAN. That is a very fine idea.

Mr. LEVERING. That just happened to come right now. That is one thing that I would have done.

Now, I want to talk a little bit about one of these bidders, and in doing that the remarks might apply to all. There is no use to go into all of them, but I will just talk about one.

Now, I am an American citizen, and if there is anything that gets me it is the way this thing has been fooled with here before this committee, and I want to call your attention to a few things. I went to Muscle Shoals, and I might just as well tell the whole truth about it. I went to Muscle Shoals for some of the parties, and Mr. Engstrum is one of the parties that contributed to the fee. He contributed \$200 out of about a \$600 fee, and they were figuring on taking it. Now, I came back and I drew up with them a bid to offer to this committee, and we went over, or took it over, to Mr. Weeks, and I thought we had a very fair offer, and one day I saw changes in it, and I walked out of the office, and would not have anything to do with it. The thing was fooled away, practically, and I want to call your attention to the things in it that no American will stand for, and you can trace those things into the other contracts.

He says to give him, upon the signing of the contract, all of the loose personal property on the job except the food supplies, whether needed for construction or not, and he will contribute a capital of two million or two and a half million dollars. Now, that property will scrap at three and a half million dollars that you give him. You have got to give him material whether it is needed for construction or not, and he will sell it to the Government, if he finishes the dam, or sell to the contractor. That is, you give him three and a half million dollars and he will get five millions dollars out of it, and capitalize himself. He comes here with his pockets wrong side out, takes property from you, capitalizes himself and makes a big profit by selling it back to you when it goes into that dam, whether it is needed for construction or not. Those words ought to put him out of this committee. I would think so. If he said "things that you could not use for construction" there might be something in it, but he puts that in there.

Senator HEFLIN. Who said that?

Mr. LEVERING. That is Engstrum.

The CHAIRMAN. Yes.

Mr. LEVERING. Now, then, there is another thing he said. They want you to finish up the steam plant at No. 2, put in 30,000 kilowatt equipment there, and if you do that he will take it and make nitrates. Now, it will cost you—and this is a low figure—at least \$4 a ton; you can not get your coal there much cheaper. It will cost you \$6,000 a day to run that plant, and they get one-third, which is \$2,000 a day, of the product. If you sold the power for what it cost, and you would have to sell it for that, he would get \$2,000 of it, and he would reduce that 20 per cent only, which would give him still over a thousand dollars a day that the Government would have to pay him for operating that plant. That 20 per cent looks like he is dividing his profit, but he is not coming any—

where near it. You see, when you burn \$6,000 worth of coal a day, about 1,500 tons a day, you are running into \$2,000,000 a year, and you have about two years to go before you can get any power from any other source, and he is not satisfied with that profit they want you to go ahead and finish up No. 2 so that they can increase their profits that much.

Now, as to making nitrates, they are like the other contractors that are going to make nitrates for an amount which would net them money. But assume that they do. He says that he is going to generate his hydrogen by electricity. Now, this gentleman over here (Major Burns) is in the Ordnance department, and I think he will tell you I am not far from right when I say that when you commence generating hydrogen from steam generated electricity, when your equipment is steam actuated, and when you want a direct current, and have to use alternating current, your hydrogen will cost you so much that it will put your plant way to the red. It would be absurd. It would be anything but businesslike. If you had secondary power there, temporary power that you could not market safely, you could use it and work the cells that generate the hydrogen, because it would be all right in that case, but when you generate current by burning coal to make hydrogen, there never would be more expensive hydrogen in the world than that. It would be perfectly impossible—perfectly absurd.

And, as the Chairman very correctly remarked to the gentleman in his testimony, he says, "You are neither an engineer nor a chemist." That was very well put, I thought, at the time.

Now, these things sometimes ought to be given consideration. I don't see that an offer like that, that asks for all the capital to come to the Government and then a bonus besides—

The CHAIRMAN. When you come to that, isn't that pretty near true of all of them?

Mr. LEVERING. I would not be surprised but what it was. But I simply took up that one as a horrible example, that they would not have to have one cent in this, and they would have all the money they needed while they were burning up that \$6,000 worth of coal, I think. They certainly would live well. I think a thing like that either ought to go to the grand jury or the waste basket. I don't think it ought to come to this committee. I never saw a thing like that before. I would not have a thing to do with it, and it has to be pretty bad before—

The CHAIRMAN. What ought we to do with it?

Mr. LEVERING. I would send it to the grand jury, I believe.

The CHAIRMAN. I mean with the power down there? What ought we to do with that Muscle Shoals, taking into consideration here that we want it for the manufacture of fertilizer in peace times, and we want to be prepared in nitrogen in time of war.

Mr. LEVERING. I have thought that thing over for a year, Senator. I have been paid for it. It is quite a problem, and this is my opinion. Now, I have taken quite an interest in your bill. I think that all the power that could be generated in Dam No. 2 and Dam No. 3 could be used immediately—not all of it by the nitrate plant, but it all could be marketed immediately. I know that could be done, because I investigated it very carefully. It could all be marketed, and it has got capital stock there to carry that proposition. Now, in your bill—you know there are two laws in this country that have been tried out, and one of them is the national-bank law. In 1830, along there when the banks were about the only corporations doing business in the country, they were attacked by every legislative body in the country. In fact, they put the national banks out of business for a time. Then the States took it up.

Senator HEFLIN. Wasn't it about to put everybody else out of business, and was not that the reason they put it out of business?

Mr. LEVERING. It was not properly adjusted—that is, the law was not—but now you take a national-bank note, under Government guaranty and supervision, and I don't care what country you are in you get a dollar back for your bank note. It is the most perfect piece of legislation this country has ever known. It is not only good in this country but every other country looks up to our national-bank note, and that is for this reason, that the bank is partly under Government control and partly under private ownership, and the private owner can not, under any circumstances, vitiate his own security. The Government holds it in such a way—

The CHAIRMAN. Even though the bank fails the bank note is good.

Mr. LEVERING. The bank note is good. Now, I think the Senator's bill here, if it goes a little bit further and puts in the power and somebody that can use or sell that power, Mr. Ford or anybody else could sell or use it, and make that guaranty a return on the Government money going in, and it will do that if it is handled right; then put the Government authorities in there to see that they do do it right, and you could start that thing off to-day and never give up a dollar's worth of that property, and finally pay for it.

Now, I have a friend here in town who is an attorney and who has had 20 years' experience in Congress. His name is James T. Lloyd. Maybe you know him.

The CHAIRMAN. Oh, yes; we know him very well. I think we all know him. Mr. LEVERING. I went down and took your bill down to him, and gave him my ideas, and asked him to draw that bill with those suggestions in it. He told me he would do it, and would do it this afternoon, and I would like to bring it up to you.

The CHAIRMAN. All right. What modifications of the bill would you have to make to conform to your ideas?

Mr. LEVERING. I would like to fix it this way. At least, I would. I may be wrong about this, but I know that the power in excess of what is used at the nitrate plant—the nitrate plant is going to run at a loss.

The CHAIRMAN. Yes.

Mr. LEVERING. Just the same as the printing of the bank notes goes at a loss. There is no revenue in that. It is one of the charges that has got to go up against the plant, and in operating the nitrate plant that has got to be one of the charges.

Senator NORBECK. May I ask a question in regard to that matter? With the best of equipment, with the best of methods, with 4 per cent money, nitrate can not be made at a profit? Is that it?

Mr. LEVERING. No; I am not sure of it.

Senator NORBECK. Therefore, in order to get cheaper nitrate the Government must pay a bonus in one form or another? That is what you mean?

Mr. LEVERING. Yes; and I think if you would make Dam No. 3 make good now it would more than cover that deficit.

Senator NORBECK. In other words, instead of a cash bonus we might use that as a water-power bonus?

Mr. LEVERING. Exactly; because it is going to waste there and it is a menace to navigation.

Senator HEFLIN. In other words, if they finish Dam No. 3 then they can make nitrates at a profit?

Mr. LEVERING. Sure; that is, operate the plant at a profit.

Senator NORBECK. But, on the other hand, if the current generated at that plant was sold it would bring a revenue. Therefore you would get as much bonus that way as the other way?

Mr. LEVERING. Yes, sir.

The CHAIRMAN. The only difference is in this case you utilize water power that would otherwise go to waste, and if you pay a cash bonus it would be a direct payment out of the Treasury of the United States.

Mr. LEVERING. Yes, sir. Mr. Lloyd is a better talker than I am, and I am going to get him to come down and explain the bill to you. We have been working it out, and we know the power can be sold in two different places. It can be used on the ground for the manufacture of phosphoric acid and aluminum. Both raw materials are there. There is no use to let it go to waste a minute longer.

The CHAIRMAN. What is your idea, that the Government retain the ownership of everything?

Mr. LEVERING. Sure. Why, I will tell you why the Congress ought to retain the ownership. When this war was declared on the 6th of April, 1917, my wife and my boy and I went to the breakfast table, and he got up from that breakfast table and within an hour he enlisted to help this war out. I went down town, and I was a little too white headed to get into the Army, so they put me into this American Protective League, looking after the slackers and selling bonds.

The CHAIRMAN. You had a harder job than he did.

Mr. LEVERING. Yes; I did. And when I went around and saw people whose sons went into the Army, and they were afraid they would not have clothing or munitions or something, and they just cut down to the bone to buy bonds, and

then the idea of going and giving it to somebody here just makes me sick. It is sacred money. A lot of that money is blood stained, and all of it, or most of it, is sweat stained, because that is the sort of people who bought the bonds. So I say a lot of it was sweat stained. It came from that kind of people.

Senator HEFLIN. Mr. Ford's people claim that they will produce fertilizer at half that price which they now sell for.

Mr. LEVERING. Yes. I hope he will.

Senator HEFLIN. And if they do there would be a saving of about \$100,000,000 a year to the farmers of the United States.

Mr. LEVERING. That would be a good saving.

Senator HEFLIN. In a hundred years that would be billions of dollars, and at the end of a hundred years the lease expires, and Mr. Ford has paid to the Government more money by that time than the Government invested at the outset; and not only that, but the river has been made navigable for miles and miles and a great industrial community has been built up, and the whole farming population of the country has been served. Now, don't you think the Government is doing good business to go into a thing like that?

Mr. LEVERING. If that was their only remedy, I should say so, certainly, if it was the only way to get nitrates. But I feel this way. I am for this Government first and then for Mr. Ford afterwards. If the Government can do a better job and safer job than Mr. Ford can, I would let the Government do it. If they can not do it, why, then, let Mr. Ford do it.

Mr. Ford during the war went out to adjust the rights of nations. He took the authority out of Congress and went over there and tried to make peace by hand, and he couldn't do it when he got over there.

Senator NORBECK. You are afraid this might be another peace-ship affair?

Mr. LEVERING. Yes, sir.

Senator NORBECK. Well, then, he came back and made a lot of supplies and material for the war?

Mr. LEVERING. Yes.

Senator NORBECK. He rendered a great service in that, didn't he?

Mr. LEVERING. Yes, sir.

Senator HEFLIN. I take it you are in favor of Mr. Engstrum's proposition instead of Mr. Ford's?

Mr. LEVERING. No, sir. I think that if this bill was so that it could not run away with itself like the Shipping Board and the railroad control bill, if it is kept within limits like the national bank law, this is the bill that I would favor.

Senator NORBECK. The Norris bill?

Mr. LEVERING. The Norris bill; yes, sir.

Senator NORBECK. I don't understand Mr. Ford has offered to make fertilizer at half price. The only offer I have seen from Mr. Ford—as I understand it—is he will take on that work, and if he can make 8 per cent profit he will keep it going.

Mr. LEVERING. I should say for Mr. Ford that he did come here and he did make a lot of things for the Government.

Senator NORBECK. I am not criticizing Mr. Ford. I am an admirer of Mr. Ford. Other things being equal, I am for Mr. Ford.

Senator HEFLIN. His engineer has said that they can produce it at half the price it is selling for now.

Senator NORBECK. No one has ever made that statement in these hearings. I am getting tired of having this asserted day after day when it is not in the record, and was never testified to.

Senator HEFLIN. I assert that it was said by Mr. Mayo.

Senator NORBECK. I assert you said it several times.

Mr. LEVERING. Senator HEFLIN is right. Mr. Mayo did say that.

Senator NORBECK. That he would make it at half price?

Mr. LEVERING. He said he expected to.

Senator NORBECK. He hoped to. Oh, yes.

Mr. LEVERING. Yes.

Senator NORBECK. Did they agree to make it at half price? They agree to make it if they could make it at 8 per cent profit.

Mr. LEVERING. But Mr. Ford did not come here and look this committee right in the face and tell them so.

The CHAIRMAN. Oh, no. I don't think there is any doubt about the fact, now. Senator HEFLIN always says in his questions, "They claim they will be

able to do it," or "they say they will be able to do it." But they are not willing to put that in the contract and agree to do it. They do say they expect to do that, but it is not in the bid.

Mr. LEVERING. Mr. Ford did say that his excess profits of \$29,000,000 will go back into the Treasury. I believe they have not found the check yet, but probably they will.

Senator HEFLIN. But he does say he won't ask but 8 per cent profit.

Mr. LEVERING. Yes, sir; that is right.

Senator HEFLIN. If he does that he will reduce the price, because the fertilizer trust takes many times 8 per cent.

Mr. LEVERING. You are just exactly right, Senator. If the Government can not do any better than the Ford offer, as a matter of patriotism they ought to give it to him. That is right.

Senator HEFLIN. You know I feel like if they don't accept his offer there is not going to be anything done down there. Then they may get behind the bill of Senator Norris and that would be better than nothing at all; and, of course, go ahead and complete the whole thing; but suppose these fertilizer concerns and power concerns in the country—they are opposing any sort of development down there. They would rather buy it outright and let it stand idle always than to see anybody develop it. Don't you believe that?

Mr. LEVERING. Yes. You are right.

Senator HEFLIN. If that is true, Senator Norris may be gone, I may be gone, and others interested in the development may be gone.

Senator NORBECK. And Ford may be gone.

Senator HEFLIN. It may be 25 years before someone else will come along and do something with it, and here is a man that will do something with it.

The CHAIRMAN. He is just as liable to die as we are.

Let me ask you—

Senator KENDRICK (Interposing). I think I get the witness's viewpoint very well.

The CHAIRMAN. I want to ask him this question here.

Mr. LEVERING. I am not here against Ford.

The CHAIRMAN. You understand what all these offers mean?

Mr. LEVERING. Yes.

The CHAIRMAN. In your judgment, now, as an engineer, take Mr. Ford's offer. Is there not a great big thing in it financially for Mr. Ford, if we accept his offer?

Mr. LEVERING. Mr. Ford, in the first place—

The CHAIRMAN (Interposing). Just in a general way, now, in your judgment. Is there a big profit for him?

Mr. LEVERING. He would make \$50,000,000 if he never turned a wheel.

The CHAIRMAN. \$50,000,000?

Mr. LEVERING. If he never turned a wheel.

Senator HEFLIN. Let him explain that, Mr. Chairman, how he could make that \$50,000,000.

The CHAIRMAN. Let me ask this question. Suppose he organizes this corporation, or this profitable venture and then dies, as he must, within the next 20 years, and more likely within the next 10, with this big profit ahead, and the corporation is bound only by what the contract provides for, would you not expect that that corporation, with the opportunity for profit ahead of it that would last, say 85 years—that is assuming he will live 15—would become the subject of any and every profiteer in the United States who had the ability or the money to get control of it?

Mr. LEVERING. That is the history of corporations.

The CHAIRMAN. And would they not then rely not upon the dead man's word, what he said here at this table that he expected to do, but on the letter of the law, upon the thing written in the bond?

Mr. LEVERING. Like the Alabama Power Co., exactly.

The CHAIRMAN. Yes, just exactly.

Would you not expect that the Alabama Power Co. would be controlling that corporation after Mr. Ford died? Would you not expect the Alabama Power Co., with its great network of wires spreading all over that country down there, would be the one that would want to get hold of it, and would they not be willing to pay an enormous price to get hold of it?

Mr. LEVERING. They are offering to buy it now.

Senator HEFLIN. Let him show how Mr. Ford would be able to make \$50,000,000 out of it by letting it stand idle.

Mr. LEVERING. I didn't say by letting it stand idle. I mean by the time it is ready to operate. I mean the project could be bonded or sold on the basis of \$50,000,000 more than he put into it at the time it was finished, without turning a wheel.

Senator NORBECK. You mean, in other words, if the Government will give you this eighty or ninety million dollars worth of property for five or six per cent of what it cost—

Mr. LEVERING (interposing). Less than that.

Senator NORBECK. And, in addition to that, they will furnish you thirty, forty, or fifty million dollars of 4 per cent money for a hundred years—

Mr. LEVERING (interposing). You could take those two tracks and—

Senator NORBECK (interposing). Capitalize them and sell them for \$50,000,000?

Mr. LEVERING. Yes, sir; I could do it and capitalize it. I have been in railroad work a good deal and I have seen money raised on corporation property and I know the process you go through; but I never saw a man come to a bank with a proposition like this, and say, "you give me \$50,000,000 and loan me all the money I want and I will fatten on it."

Senator NORBECK. I will put some more in, and if what I put in additional will earn me 8 per cent I will make fertilizer for you.

Mr. LEVERING. I never saw anything like that.

Senator HEFLIN. You know the contract has not been drawn up with Mr. Ford.

Mr. LEVERING. No.

Senator HEFLIN. But when it is he has said here what he will do, and the Attorney General of the United States would be consulted, I suppose, and we will fix up a contract that would bind him specifically to do certain things.

Mr. LEVERING. Yes.

Senator NORBECK. And would you compel him by mandamus to sign it?

Senator HEFLIN. No. If he did not sign it he would not have the contract, but if he did sign it and give a bond we could compel him to comply with the conditions.

Mr. LEVERING. I suppose you could.

Senator NORBECK. How could you when the contract is not signed by Mr. Ford, but some new corporation to be formed with small capital?

Mr. LEVERING. He has not even agreed to go into that corporation, you will notice.

Senator HEFLIN. Could we not make the contract bind the corporation?

Mr. LEVERING. I believe you could.

Senator NORBECK. Can you bind the corporation more than its capital? If its capital is one-fifth of the property, what guaranty have you got?

Mr. LEVERING. As I say, it is not a proposition that one would go to a bank with to finance. I would not take it up with a bank except by letter. I would not show up there personally.

Senator HEFLIN. Suppose the corporation declines to comply with the contract, what do you suppose the Congress would do by joint resolution?

Mr. LEVERING. I don't know.

Senator HEFLIN. Would it not declare the contract null and void? Would it not end the life of the lease?

Mr. LEVERING. I believe you ought to.

Senator HEFLIN. There are many ways we could force compliance with the contract.

Mr. LEVERING. But he has walked away with all the property.

Senator NORBECK. But Mr. Ford has never agreed to sign any contract with the Government. It is true a corporation could be formed.

Mr. LEVERING. That is the way I want to see the contract. I am not here to fight Mr. Ford or to keep him from getting this contract if he has the best offer.

Senator NORBECK. I am in favor of Ford, but I don't want to fool myself or anybody else.

Mr. LEVERING. Yes.

Senator KENDRICK. As I understand the witness, he is not here to advocate the cause of any one of the men who have propositions before this committee; but what you want to see before this committee acts is a business proposition?

Mr. LEVERING. Yes; exactly.

Senator KENDRICK. I would like to see it myself, and I have not seen it yet.

Mr. LEVERING. I have put a lot of time in this thing, and I just felt, if I didn't do any good, I would like to come and talk to you about it. I think that the Engstrum contract would be a scandal if it was ever signed up.

Senator HEFLIN. Whose contract?

Mr. LEVERING. The Engstrum contract would be a scandal if it was signed up. This man came here and said something about Goethals. Mr. Goethals did not show up here. I noticed that.

Senator HEFLIN. You believe Goethals is not——

Mr. LEVERING (interposing). I think he is a long ways from here. I look upon Mr. Goethals as a great man, and I do not believe that he——

The CHAIRMAN (interposing). If we will treat Engstrum the same as it is desired to treat Ford, we would have to take that word for law that Goethals was going to have charge of it. They are not bound up in their contract that Goethals will have anything to do with it. On the other hand, Ford's plan says they expect to make nitrate at half price, but there is nothing in the contract that binds him to do it.

Mr. LEVERING. A number of years ago General Grant in New York got in with the banks and got tangled up, you know. Goethals may do the same thing.

The CHAIRMAN. General Grant got the worst of it.

Mr. LEVERING. Yes, sir.

The CHAIRMAN. And ruined a very beautiful life's reputation and dragged his friends down to ruin, and he died with a broken heart.

Senator HEFLIN. They say they will produce fertilizers cheaper than they are being produced now, and we do know that the Fertilizer Trust is fighting to the death Ford and his proposition.

The CHAIRMAN. Senator, if this is utilized, as I want to see it done, to make fertilizer only with the object that we will cut the price down, no matter who does it——

Senator HEFLIN (interposing). Suppose it will do that, I don't think Mr. Ford, probably, or anybody else, would sign a contract that he is going to go down there and take up a nitrate proposition and guarantee he will make it for half price, but he does say, or his representatives do, that he will make that cheaper than it is now being sold, and Mr. Mayo, his chief engineer, said about half.

The CHAIRMAN. Yes; but have we got any way of making them do it without signing a contract? We have no way to force them to do it except by a contract.

Senator HEFLIN. It is lying idle now.

Mr. LEVERING. As an American citizen I am saying that we have in this country no nitrate source. That is, we have no dependable source of nitrate. When the law was passed establishing Muscle Shoals I looked upon that as the last clause in our declaration of independence. We then were independent of every nation. Now we are not independent even of that little 2 by 4 nation in South America that makes annually millions of dollars off of our enterprises by putting an export tax on it. They have got us tied up. I was in hopes that the great purpose for which that dam was started would be carried out. It was a sacred contract, as it looked to me, to the American people, that we were at least independent of the other nations.

Senator HEFLIN. Now, then, Mr. Ford proposes to enter into a contract with the Government to turn that plant over for the purpose of making nitrates in time of war.

Mr. LEVERING. Yes. But now I want to say, supposing he should go in——

Senator HEFLIN (interposing). Would not that make us independent of Chile?

Mr. LEVERING. You know that is his opinion of when it would be ready to make nitrates. That is his interpretation of that.

The CHAIRMAN. If we turned it over, he would have to pay for it, and it is his property.

Mr. LEVERING. You would have to buy it back again.

The CHAIRMAN. And we ought not to let anybody have it.

Mr. LEVERING. He does not turn that property back at the same price you give it to him, I notice.

But I want to finish this idea. In other words, in case war comes and that plant was in the hands of a pacifist or a slacker, or somebody in whose family was a slacker, that might make it very embarrassing for the Government to get into action quickly.

The CHAIRMAN. They might destroy the machinery like they did the machinery in some of the ships.

Mr. LEVERING. The whole lifeblood of our country is right in that one plant, and I say it ought to be taken care of very carefully. That is the lifeblood of

this country if we are attacked, either internally or externally. It ought to be taken care of just exactly like the American people thought it would be when the money was voted.

The CHAIRMAN. And there is only one way to do that, and that is for the Government to retain this property?

Mr. LEVERING. There is only one way, and only one arm of this Government ought to be trusted with it, not because it is the only arm that is loyal, and I think the Army should be allowed to know all about that plant and to take care of it in that way that they can immediately know that it can be utilized.

The CHAIRMAN. There is not any assurance in any of these propositions—the Alabama Power Co.'s, Engstrom's, or Ford's—

Mr. LEVERING. The Alabama Power Co. is just as bad.

The CHAIRMAN. But what the corporation that is going to take over the property might be owned in Germany or Great Britain or France or Italy or Russia by the bolshevists, and that when we get into the next war, if we were so unfortunate as to do it, the enemy or people that we are going to war with might own the very property that we were depending on to make our explosives.

Mr. LEVERING. That is right. And I want to say that I do not see that we have any right to let that go out of Government control. If we could go out and buy nitrates anywhere in the country, that would be all right, like the cottonments, but that nitrate plant can not be built in a day or in a year.

Senator KENDRICK. Are there not two propositions here? First, you are not finding any fault with the propositions these men are making?

Mr. LEVERING. No.

Senator HEFLIN. He is just against them all.

Mr. LEVERING. Now, Senator, you are not in favor of giving it to Mr. Ford, are you?

Senator HEFLIN. I am certainly in favor of his offer. I think it is the only way that we are going to get the development and secure the production of cheap fertilizers and relieve the farmers from the clutches of the Fertilizer Trust of America.

Mr. LEVERING. If you are right, Ford ought to have that proposition.

Senator HEFLIN. I say he ought.

Mr. LEVERING. But I am not sure we are in that shape that we have to turn the functions of this Government over to any man, I don't care who he is.

Senator HEFLIN. Then you would let that property lie idle just as it is; let it go to waste?

Mr. LEVERING. You could not use it in time of war and right now.

Senator HEFLIN. Ford said he would turn it over to us at any time.

Mr. LEVERING. I know.

Senator HEFLIN. He would contract to do that, and we could go down and take charge of it. Is there any way to keep us from doing that?

Mr. LEVERING. No; there is not any way at all. But, Senator, let us, I say, first, before that goes to Ford, look at it from the Government proposition and see if we can not solve it by the people, for the people, and in the interest of the people. If we can not, then let us give it to Ford, for Ford, and in Ford's interest. That is what I say. But let us try our own interests first.

Senator KENDRICK. I started to ask you a question a while ago and I was interrupted.

Mr. LEVERING. Excuse me.

Senator KENDRICK. You are not complaining about the propositions these men make?

Mr. LEVERING. No.

Senator KENDRICK. But you insist that the responsibility of deciding this thing is upon this committee?

Mr. LEVERING. It is indeed.

Senator KENDRICK. To decide it in the interest of the Government?

Mr. LEVERING. To decide it in the interest of the Government. And it is a very important question, too. It is a very important question.

Senator KENDRICK. Incidentally I have been very greatly impressed with the idea of allowing Ford to handle this, but I want Ford to submit a business proposition before we turn it over to him.

Mr. LEVERING. They said Mr. Ford and Mr. Edison were going to do wonders. There is about—I don't know how many thousand acres of land down there cut up into little bits of lots already, when Ford goes there—

Senator NOBBECK. Do you think that some of these people, when they say Ford and Edison will do wonders, mean by wonders that they will boost the price of land they have for sale?

Mr. LEVERING. The other day I saw a man who had lots for sale near Ford's plant. I said: "Who is boosting Ford?" I meant to bring some of the circulars down here and show them to you. I believe the propaganda that is going out in favor of Ford, lots of it is from men who will make ten or fifteen millions of clean-up on the sale of land. He says: "Mr. Ford will have to have part of this land, and if you will buy it now you can get a good price for it later."

The CHAIRMAN. You could hold up Ford?

Mr. LEVERING. Yes; I suppose he wants to hold up poor old Ford.

Senator HEFLIN. Is not that the case always where industry springs up?

Mr. LEVERING. Yes, sir; it is.

Senator HEFLIN. Is it not legitimate speculation by people who have money to go down and get in on the ground floor? Is not that usual?

Mr. LEVERING. Well, it is the practice. I never built a railroad into a town in my life—

Senator HEFLIN. Do you blame those people who have got money and think that it is a good investment down there for going and putting it in real estate?

Mr. LEVERING. I don't like it, and I will tell you why.

Senator HEFLIN. You don't like it?

Mr. LEVERING. No, sir.

Senator HEFLIN. Would not that put that money into circulation, and don't we need it in these depressed times?

Mr. LEVERING. Well, it is not good money. I have built railroads many times and always there was a boom in lots when we got in. I don't know how many times; but so many times, and the man that bought that lot is the man I felt sorry for. It never came up to his expectations.

I went to Los Angeles in 1878 and bought some property, and I still own property there. That one town did come up to expectations.

Senator HEFLIN. It is the fear you have for the poor fellows that will be hurt that causes you to feel that way?

Mr. LEVERING. The suckers; yes.

Senator HEFLIN. You don't want the suckers to get caught. You would rather just let it all grow up to weeds down there?

Mr. LEVERING. No, sir, Senator. I think that sucker money is behind all this inflammatory propaganda that has gone out. I think so.

The CHAIRMAN. You don't think it is necessary to have suckers in order to prevent the weeds from growing up?

Mr. LEVERING. No; I don't think so.

The CHAIRMAN. If we just keep the plant and operate it ourselves we will have neither weeds nor suckers?

Mr. LEVERING. Yes.

Senator HEFLIN. How would a lot of big fish live if it were not for the suckers?

Mr. LEVERING. That is right. That is the way they keep going.

The CHAIRMAN. Well, let us not help them any.

Mr. LEVERING. I want to say another thing. Of course, it is your business to give this to the best offer that comes along, and if Mr. Ford's is the best offer you would be derelict in your duty if you did not give it to him.

Senator HEFLIN. Which one do you think is the best offer?

Mr. LEVERING. I believe I would decline to vote in this case if it was up to me and I was in the Senate.

Senator NORBECK. You think you would prefer Senator Norris's bill to any of them?

Mr. LEVERING. Sure, I prefer Senator Norris's bill, but I think that really could be improved some. I think the Senator will admit that himself. I believe there is some improvement that could be made, Senator Norris, so that it would not be open to the objection that it would be open to in its present condition. I believe it is a lack of confidence in the Government to say to any man that we can not handle it, "You come and run this business for us."

Senator NORBECK. Do you live in Washington?

Mr. LEVERING. No, sir; I live in Los Angeles.

Senator NORBECK. I believe the people of Los Angeles have managed their business pretty well, haven't they?

Mr. LEVERING. The city does very well. They own most of their utilities, their electric lights and water.

Senator NORBECK. And they built that water enterprise at a very large expense, and did it economically, and have handled it efficiently?

Mr. LEVERING. They did it pretty fair.

Senator NORBECK. And saved the people a lot of money over what they would have been compelled to pay had it been done by some corporation.

Mr. LEVERING. It has been a great asset to the city. The city has gone to a great deal of expense. It has been one of the public utilities that has been built so as not to bring discredit on the city. It could have been better. There is nothing perfect in this country or in this world. We don't expect that.

Senator HEFLIN. I didn't hear your opening statement. What business connections have you?

Mr. LEVERING. I am a civil engineer. I went down to Muscle Shoals in June of last year, before the work stopped.

The CHAIRMAN. He went all over that before you came in, Senator. That is all in the record.

Senator HEFLIN. You are in no way connected with any electric or power company?

Mr. LEVERING. No, sir.

Senator HEFLIN. Nor any water-power proposition in the country?

Mr. LEVERING. No, sir.

Senator HEFLIN. Nor any fertilizer proposition?

Mr. LEVERING. I will tell you what I did do: I went to Wilmington, Del., and took it up with the engineers of the Du Pont Co.—one of the parties I wanted to know about the nitrate business. I thought I could get them to take it.

Senator HEFLIN. The Du Pont Co.?

Mr. LEVERING. Yes, sir. I went over there, and I went over that nitrate business very thoroughly with them. They have about \$50,000,000 invested in Chile, and they have tried air nitrate work a good deal, and they gave me the benefit of their experience, and their verdict was that they could not lose money much faster than by getting into Muscle Shoals.

Senator HEFLIN. Don't you think they don't want anything over here developed that would be in competition with their interests in Chile?

Mr. LEVERING. Sure, they don't.

Senator HEFLIN. They don't like to see Muscle Shoals developed and turned over to Ford, do they?

Mr. LEVERING. I will tell you just what they told me. I give it as their talk to me; and I think it is perfectly honest—that they did not want to go into Muscle Shoals. They made no offer for it, and I couldn't see why they didn't. They explained to me why they didn't. They could beat—even paying \$11 import duty from Chile—they could still beat anything that was developed yet in air nitrate manufacture.

Senator NORBECK. Even with 4 per cent money they could not make fertilizers as cheap as they could ship them into this country from Chile? Was that their position?

Mr. LEVERING. That was their position; and I talked it over with them several days and went over the thing very carefully, and they convinced me. They might have been wrong, but I think if they could have got that supply of nitrates cheaper here than in Chile they would shut down in Chile in a minute and begin getting their nitrates here. But it was a matter of dollars and cents with them.

Senator HEFLIN. Why didn't you go to Mr. Ford and talk with him about it?

Senator NORBECK. This was after Ford was back with his peace ship?

Mr. LEVERING. I will tell you why I didn't go to Ford. I knew Mr. Worthington was talking with Ford, and I saw Mr. Ford's proposition earlier than a good many of you think I did. I thought that the Ford proposition was not in my line. I was not working with Mr. Ford, or anything.

Senator HEFLIN. Did you talk with Mr. Ford?

Mr. LEVERING. No; I never did.

Senator HEFLIN. Did you talk to any representative of Mr. Ford?

Mr. LEVERING. I have talked with Mr. Worthington and Mr. Mayo.

Senator HEFLIN. Did you ever intimate to them that you would be glad to join them in any work they were doing down there?

Mr. LEVERING. No; I never did.

Senator HEFLIN. Would you, if they had offered you sufficient inducements, have joined them in their project down there?

Mr. LEVERING. I would work for them, if I got the money I wanted, you see, but I have no idea—

Senator HEFLIN (interposing). That would have had some influence with you?

Mr. LEVERING. It might have.

Senator HEFLIN. It probably would have weighed more heavily on your constitution than the situation now does?

Mr. LEVERING. Well, it probably would. But I want to say one thing, that there is no vacancy in the Ford work there.

Senator NORBECK. Are you looking for a job?

Mr. LEVERING. Not there; I am not.

Senator HEFLIN. You say there is no vacancy in his forces?

Mr. LEVERING. Not that I have heard of.

Senator HEFLIN. It looks like a closed proposition to you, then?

Mr. LEVERING. Yes; it looks like no chance to get in there, and I have never tried to get in. I have never endeavored to get in. I think they have got good men and their business is well handled. They don't need anybody else that I can see.

The CHAIRMAN. You think they don't have need of your services; they have enough good men already?

Mr. LEVERING. Yes.

Senator HEFLIN. But you did try to get the Du Pont Power Co. to take it?

Mr. LEVERING. I tried to get them to take over the nitrate plant or assist in operating the nitrate plant for the Arkansas Light & Power Co. The nitrate business kind of stuck them, and I went over to see what the Du Ponts would do to make up a combination, and that was all. I went there and talked it over with the Du Ponts with that idea in view. They treated me very nicely and went into the details of their manufacture very carefully.

Senator NORBECK. And it convinced you that you could not manufacture nitrate in competition with the Chilean product?

Mr. LEVERING. Could not. They could not do it.

Senator HEFLIN. I thought you said awhile ago if they got all these dams completed down there they could compete with anybody.

Mr. LEVERING. That would be as a plant; not as nitrate per se.

The CHAIRMAN. He means, as I understand, if you put it all together, you could make enough money on the water power to keep your nitrate plant going, and make money out of the whole operation.

Mr. LEVERING. Yes. You could then amortize the investment.

The CHAIRMAN. Yes.

Mr. LEVERING. But you could not amortize the investment on Dam No. 2.

Senator NORBECK. But if you had water power that the Government gave you you could hook up the whole proposition and make it pay?

Mr. LEVERING. Yes.

Senator HEFLIN. You are merely giving your opinion about that. You may be mistaken as to whether they could make that profitably or not?

Mr. LEVERING. It looks to me like they could.

Senator HEFLIN. You understand he has another process for making fertilizer ingredients and can make it much cheaper than the present plant. If he has got that you are mistaken, are you not?

Mr. LEVERING. Yes; I would be very badly mistaken if he has it.

Senator HEFLIN. You doubt that, do you?

Mr. LEVERING. Yes, sir; I do, and I will tell you why. The cyanamid process can be cheapened, that is certain. It can be cheapened and, as Mr. Mayo said when he was here, it is possible to work nitrate and aluminum together, but it is neither good aluminum nor good nitrate process. If you are going to be in a rush for nitrates, you would be tied down with your aluminum end of it. I think that the cyanamid process can be cheapened, but I don't believe that it could ever be brought down to the figure that a process similar to the Haber process can be brought down to. The Haber process is going to be a success or not depending on one thing: If you are going to have secondary power enough and often enough to generate your hydrogen. In the Haber process about 70 per cent of the money or 50 per cent, anyway—25 per cent of it goes into the generating of hydrogen.

Senator NORBECK. May I ask do you mean to say that there is a much larger per cent of power in that, so that cheapening the power will reduce the product more in the Haber process than in the other?

Mr. LEVERING. Yes. As I say, if you substitute power for the coke method of getting out the hydrogen. If you get cheap enough power. I want to explain to you now that 25 per cent of the cost of nitrates under the Haber process is chargeable to the generating of the hydrogen, and when it is generated it carries carbonic dioxide monoxide, then 50 per cent of the cost is in purifying

the hydrogen, making altogether about 70 or 75 per cent of the process, is getting your pure hydrogen. If we have excess—which you would have an excess of secondary current when you put both dams in operation, you would then get your hydrogen almost for nothing, and you cut off your 75 per cent plus the cost of maintaining the cells, so that I think it would be a very safe figure to say that if both dams were in operation and you had that excess of secondary power, you could cut the price down to about 50 per cent of what it is now.

The CHAIRMAN. The experts gave us the information that in the Haber process power was a very inconsiderable item.

Mr. LEVERING. It is now, because they generate the hydrogen from the coke process, you see.

The CHAIRMAN. Yes.

Mr. LEVERING. But I say if you can substitute that—

The CHAIRMAN. Can you, now? Is that a practical proposition?

Mr. LEVERING. Sure. This gentleman [Major Burns] can explain that to you. That may be done if you have the current cheap enough, but you can not, as Senator Butler says, generate your current with coal and do it.

The CHAIRMAN. I understand now, but if you get your hydrogen—

Mr. LEVERING. You could cut off 50 per cent of the cost.

The CHAIRMAN. Fifty per cent of the cost?

Mr. LEVERING. Yes, sir.

The CHAIRMAN. In doing that the question of power is the primary consideration?

Mr. LEVERING. Yes; that would be.

The CHAIRMAN. You propose to do that with secondary power?

Mr. LEVERING. Yes.

The CHAIRMAN. That is, power that can not be used all the time?

Mr. LEVERING. Yes.

The CHAIRMAN. Then you would only operate part of the time?

Mr. LEVERING. You would only operate cells part of the time.

The CHAIRMAN. Is this true: You would be operating those cells part of the time, but you would get a supply of hydrogen in excess of that which you could use while you were operating them; so that, say, you operated those for 10 months in the year you would have a supply of hydrogen enough to last you in finishing your process for 12 months? Is that true?

Mr. LEVERING. It would be a matter of adjusting the plant to do that thing.

The CHAIRMAN. In that way you would utilize your secondary power?

Mr. LEVERING. Yes. And then you could sell that primary power.

Senator HEFLIN. Then you would make it cheaper than Mr. Ford says he can?

Mr. LEVERING. You can cut off 50 per cent.

Senator HEFLIN. He says 50 per cent.

Mr. LEVERING. Under this basis.

Senator NORBECK. Couldn't you do that under the Norris bill as well as under the Ford plan? I say couldn't you do the same thing under the Norris bill as under the Ford offer?

Mr. LEVERING. Yes. I think the Norris bill—or, excuse me, the chairman's bill—could be adjusted just a little bit, and I believe that Senator Hefflin would get right up and talk for it quicker than anybody.

Senator HEFLIN. I see the great good that will come from this making the river navigable, which is worth a great deal to the future of that whole country. It will bring down freight rates, and it will add this power that is going to waste, will put it to making fertilizers in time of peace and nitrates in time of war, and build up an industrial city there. It looks to me like the greatest hope we have is in the Ford offer. We are going on under the amendment that Senator Norris has already offered to complete Dam No. 2. I am talking about operating and doing something after we get through with this, and I feel that unless the Ford offer is accepted influences will be brought to bear, just as you suggested a while ago, from the Du Pont Powder Co. and every big and powerful political influence in this country, that will keep anything from being done at Muscle Shoals, unless a man like Ford, who has got the money to do it himself, gets hold of it.

Senator NORBECK. What might those influences do when Ford leaves it?

Senator HEFLIN. The corporation will be there then, and you have got it in a contract.

Mr. LEVERING. I want to say that I have been around the world a little bit, you know, and I may express this opinion, and it is just my opinion only, and is

nothing but that, but as long as we are talking the matter out, if I know anything about anything at all it is railroad construction, add a little bit about the operation of it, and when I read in the papers that Ford had bought a railroad and was going to make a big per cent on the money clear, I watched the matter very thoroughly and saw in the report of the Interstate Commerce Commission some time afterwards where he had a deficit of \$135,000 in one month in his operations, I said to myself, "Mr. Ford, your efficiency is in ringing the bell and blowing the whistle," and it may be that way here.

Senator NORBECK. You think he has got to make a great deal better success with the fertilizer business than he did with the railroad business or it will be a fiasco?

Senator HEFLIN. But his railroad is a paying investment now, is it not?

Mr. LEVERING. I think it came back to normal in the last month; I mean to making a profit. I think it did.

Senator HEFLIN. Well, you are talking about when he first got it and commenced to operate it.

Mr. LEVERING. No. The first month he ran ahead. He did not put up much money.

Senator HEFLIN. As soon as he learned the business he made it a paying investment, did he not?

Mr. LEVERING. Any road once in awhile will pick up, you know, but I do not think that the road, for the three months that he has had it, has been a profitable proposition. I do not think any railroad in the country is paying very much.

The CHAIRMAN. I do not think this has anything to do with this hearing, but don't you think in that very railroad operation there that Mr. Ford performed an example for the country that was very valuable, when he showed that he could take a railroad that was run down and operate it efficiently, making it successful, without any great deal of financial legerdemain about it, when he has made a success out of what had been a failure before when the magnates were operating it?

Mr. LEVERING. I hope he did.

The CHAIRMAN. Well, it looks to me as if he did it in that operation.

Mr. LEVERING. Of course, he has not gone broke yet.

The CHAIRMAN. No.

Mr. LEVERING. But the railroad has not accumulated any money yet, either.

The CHAIRMAN. Well, he took a railroad, as I understand it—I do not know anything about the details—when it was wrecked financially, was it not?

Mr. LEVERING. Yes; it was.

The CHAIRMAN. And doing nothing.

Mr. LEVERING. No; it was operating, I think.

The CHAIRMAN. Well, I think it was about to stop operations.

Mr. LEVERING. I do not know.

Senator NORBECK. To what extent is that additional efficiency due to his shipping his own heavy freight shipments over that line?

Mr. LEVERING. Well, he saved up his business, I imagine, and when he opened it he had a lot of good business to put in there. It was business that paid a big freight rate, and it was all first-class freight.

Senator NORBECK. Was it not somewhat like the short lines of the packers in Chicago, which they used to switch their cars on, in order to get a split of the freight rate, and which made the short-line operation a profitable one?

Mr. LEVERING. I do not know. I just cited that instance, that I noticed that there was a \$135,000 deficit in one month, and I was just wondering whether Muscle Shoals would not have its bad months, too, if he had it. I was just wondering about that; I don't know. But I want to say that I am an American citizen, and if our Government can not function we ought to get Ford to do it and keep the country going.

The CHAIRMAN. Well, if we had to turn it over to somebody I would just as soon turn it over to Mr. Ford as to anybody I know, and I would much rather turn it over to him than to a lot of others; but I do not want to turn it over to anybody. Are you in doubt about our ability to function here?

Mr. LEVERING. No.

The CHAIRMAN. If we can not function we might as well go back to England and become one of her colonies again and let the King run it.

Mr. LEVERING. No; I have not said that you should give it to anybody, and have it run for you.

The CHAIRMAN. No; I know you have not.

Senator HEFLIN. It has been a good while since we shut down work there, and I have not heard you complain about the Government failing to function.

Mr. LEVERING. Well, I went down there and looked it over and I was surprised. I know, of course, that there was a lot of extra money invested on it that would not have been invested if it was done quietly in times of peace, but I do not believe there was a dollar of that money that was squandered. I do not believe there was any graft down there at all. There were just acres of material there and miles of sewers.

The CHAIRMAN. There were lots of instances, I suppose, where they probably used bad judgment.

Mr. LEVERING. Yes; but you must remember that during that time the flu came on and there were from 40 to 70 funerals every day.

The CHAIRMAN. Is that so?

Mr. LEVERING. Yes.

Senator HEFLIN. Yes; they had an epidemic down there.

Mr. LEVERING. And they were all trying their very best to get out of there.

The CHAIRMAN. If I did not know that they had that difficulty in addition to the others.

Mr. LEVERING. Yes. I came back and a man asked me what I found there. I said I found a railroad, a club house, engines and sewers, and every damned thing but a dam. I could see that they were afraid of their lives there; they did not know who would be in the box next day. Now, you could criticize a lot of that work that you would not dare to criticize if you had been on the ground at the time. I am not at all dubious about that Dam No. 2 being built right.

Senator NORBECK. Was it a mistake to start the dam right during the peak of prices, when the dam could not be used in connection with the plant, anyway?

Mr. LEVERING. Well, I was not responsible for that.

Senator NORBECK. But that was a mistake in judgment, was it not?

Mr. LEVERING. I should think so, looking back at it now; but it might have been different then.

The CHAIRMAN. I suppose even though it did not commence operations—and I do not want to criticize anybody unless I have a reason for it—

Mr. LEVERING. Yes; that is right.

The CHAIRMAN. I suppose, however, it did not commence until after the armistice, when the preparations were all made.

Mr. LEVERING. Yes, sir.

The CHAIRMAN. And everything was done.

Mr. LEVERING. Yes.

The CHAIRMAN. The railroad was built across the river?

Mr. LEVERING. Yes.

The CHAIRMAN. And the mixing machines were all ready to go?

Mr. LEVERING. Yes, sir. But I want to say, gentlemen, that any man that would shut that plant down and turn back and depend on Chile, had better try to cut out our Constitution and turn us back to England. I will tell you it was a very embarrassing thing—

Senator NORBECK. The Government ought to make sure that we have plenty of nitrate plants in the country.

Mr. LEVERING. Yes. What is the use of having a gun without ammunition, and what is the use of putting your ammunition into the hands of a man if you can not tell whether he is loyal or not?

Senator HEFLIN. Don't you think the Government is functioning when it goes ahead and completes this dam, and then leases this property to Mr. Ford to make something that will cut prices to a great number of people in this country, that will make the river navigable, that will help commerce, and that will keep the plant open for the purpose of making nitrates in time of need? Is not it functioning when it does that?

The CHAIRMAN. If we were pushed up against it and there was only one way to do it and that was by a man who had to do it, that would be the proper thing to do, but it does not follow that we have to turn it over to a certain man just because we want to get a certain result.

Mr. LEVERING. If we have to get one man for all of our brains and enterprise, I think we had better get a king.

Senator HEFLIN. I am not suggesting that, but we are suggesting a proposition here to utilize this power down there.

Mr. LEVERING. It ought to be utilized to-day, even.

Senator HEFLIN. Suppose the Government should complete it and the Government went into the manufacture of fertilizers, how long do you believe it would

be before influence would be exerted here to stop the Government from competition with private industry?

Mr. LEVERING. I want to be honest with you, Senator, and I feel that that might creep into the Norris bill. I am afraid that that might. That is the reason why I would like a guarantee behind that, to shut that out. That is the only reason.

Senator HEFLIN. You mean, to keep the Government from being in competition with private industry?

Mr. LEVERING. To keep the Government from being imposed upon.

Senator HEFLIN. Then the Government would have to keep it idle.

Mr. LEVERING. No. If the Government does that it had better give it to Ford a thousand times over.

Senator HEFLIN. But you would have the Government go into the manufacture of fertilizers, then?

Mr. LEVERING. In a way, I would like to have the Government watch that thing and be a part of it, so it could not be stopped.

Senator HEFLIN. Suppose the Government would start to manufacture fertilizers, don't you believe that every fertilizer manufacturer in the country would come down to Washington and use his influence to get the Government out of competition with them?

Mr. LEVERING. No; I do not.

Senator HEFLIN. And don't you think that, in due time, the plant would be shut down under the public opinion that would be created?

Mr. LEVERING. No. I do not think so, Senator, because, as I say, I was making an investigation to see what could be done with that nitrate, and I do not think anybody would want to shut it down if they could get nitrates.

Senator HEFLIN. In other words, they would like to have it run on a small scale; they are afraid that Mr. Ford will be a great competitor; is not that true?

Mr. LEVERING. No; I think the nitrate people—and I have been talking with them—would just as lief buy their nitrates here as in Chile.

Senator HEFLIN. Don't you believe that the fertilizer concerns are opposed to Mr. Ford's going into this thing for the purpose of making fertilizers?

Mr. LEVERING. I believe they are.

Senator HEFLIN. Don't you think it would be against their interests if he gets it?

Mr. LEVERING. Yes; I think so.

Senator HEFLIN. Don't you think that that is the motive behind their actions?

Mr. LEVERING. I do not think it is anything else.

Senator HEFLIN. Now, if the Government would take it and operate it on a small scale and just make the nitrates they would not care, would they?

Mr. LEVERING. I do not think it would be on a small scale. I think it would be a bigger operation than Mr. Ford would make out of it.

Senator HEFLIN. Well, do you think these other concerns would consent to the Government operating it in times of peace, in competition with them?

Mr. LEVERING. I think so, if they would make nitrates, because there would be their source of nitrates.

Now, one thing more. I have heard this raised so many times here, and I feel that I should give you one more idea there, and that is that it is not possible nor practicable for them to make concentrated nitrates and sell them to the farmers to be mixed. You have to have mixing plants to mix them. I will tell you from my experience, and I have been an engineer and have noticed this, that in the last 20 years cement has come into use much more universally than it ever was before. We fixed, mixed, that cement with the aggregates with a shovel, turning it over, and we never could get a uniform mixture. Some samples would break easier than others; and along came the mixer man. He made a mixer, and he is getting it better and better every day. Now, that cement is mixed so that one sample is just as good as another, practically.

When we come to mix that little particle of active chemical so that it will not burn the root of that little plant you have to mix it very evenly over your aggregates, and I believe instead of selling to the farmer, that every county or community would have a mixing plant. In California the farmers sell their oranges and other fruit and vegetables through a farm bureau. They have their refrigerating plants and packing houses, and in almost every town they have a committee of farmers, a community service. I believe we could just put a mixer in there, and they could buy that and give it to the farmers and save freight in that way. Then you would have a well-mixed fertilizer.

but when you have to put it in the wagon bed and mix it up, you can do it in a way that will not help the little plant that gets the live chemical against it.

The CHAIRMAN. You may kill rather than nourish.

Mr. LEVERING. Yes. I know that from my experience in the mixing of cement. I know that that machine will mix it, and by and by you will work this out in that way. Every community will have a mixer, like a mill where you have your corn ground. There would be no use in mixing at Muscle Shoals and shipping it out. That would be wrong.

I am through now, I believe.

The CHAIRMAN. All right; we are very much obliged to you, Mr. Levering.

Mr. LEVERING. I thank you.

Senator HEFLIN. Mr. Levering, I believe you stated at the outset that you were not appearing here for any special interest?

Mr. LEVERING. No. I might say that I am appearing here for Senator Norris's bill.

Senator HEFLIN. You are?

Mr. LEVERING. Yes, sir; I will back that bill.

Senator HEFLIN. But you do not represent any other outside interest?

Mr. LEVERING. None at all.

The CHAIRMAN. We will adjourn here until 10.30 o'clock to-morrow morning.

STATEMENT OF MR. JAMES T. LLOYD, ATTORNEY AT LAW, WASHINGTON, D. C.

Mr. LLOYD. Mr. Chairman, for the record I suppose I should state something about who I am.

The CHAIRMAN. Yes, sir. Of course we all know that, Mr. Lloyd, but you had better put that in the record. Your own experience tells you just what you ought to put in the record.

Mr. LLOYD. Senator, you know, but there are some members of your committee who do not.

The CHAIRMAN. I presume that is true. They have come in since you went out of Congress.

Mr. LLOYD. My name is James T. Lloyd. I am a practicing attorney in Washington, D. C., formerly of Missouri, a practicing lawyer there; for 20 years I was a Member of the lower House of Congress, from 1897 until 1917. I have been practicing law in Washington since retirement from Congress.

You naturally wish to know at this time, and have a right to know, how it happens that I appear before you. I became interested in the power proposition while it was attempted to secure the legislation which would authorize the construction of what is known as the Keokuk Dam across the Mississippi River at Keokuk, Iowa. I had something to do with the preparation of that bill and its passage through the lower House of Congress. Since that time I have been interested in the water-power proposition, and while I was never on the Interstate and Foreign Commerce Committee of the House, which had charge of such bills, as a Representative I was deeply concerned in securing to the people of the United States the benefits which might accrue from the use of power which might be generated by the use of the falls in various navigable rivers of the country.

I have not had any direct connection with the Muscle Shoals proposition. I have none now. I have the interest that any public citizen, I think, should have in a matter of so great importance as this. I am not attorney for anyone. I am not interested for any interests that are concerned in securing any kind of control of the Muscle Shoals proposition. My immediate connection with this matter was brought about by a conversation which I had with Mr. Levering, who has previously testified before this committee. He came to me and talked to me about the Muscle Shoals situation and expressed a desire to bring about, if possible, some kind of proposition which would be practicable and would be workable and that would be acceptable to the Government and to business interests which might be connected with the enterprise. He has talked to me from time to time since that, covering a period of perhaps a month, about the situation and about the suggestion of what kind of a plan that might be effective.

It might seem a little strange that I should interest myself in a matter where I am not employed as an attorney and where I have no interest, either direct or prospective.

The CHAIRMAN. Now, Mr. Lloyd, to those member of the committee who are as well acquainted with you as I am, that is not surprising at all. I assume that you have the interest here of an American citizen interested in the welfare of the people and the preservation of whatever, in your judgment, ought to be preserved in the way of the rights of the people, and any man who looks up your record while you were serving in the House of Representatives would understand why you would volunteer to come here if you thought you had any ideas that might be beneficial.

Mr. LLOYD. May I say, in addition, that I think I have a little more than the ordinary interest of an American citizen because of my connection with the legislative bodies and because of the interest that I have taken in the question of water power and the use of it.

I have sufficiently, I think, explained why I am here.

My impression is that there are three things in which this committee and the Congress and the country are especially concerned: First, and primarily—I think we ought to say primarily—is the improvement of the navigation of the Tennessee River; second, the use of the power that may be generated at Muscle Shoals; and, third, the nitrate products that might result from the location of plants at Muscle Shoals which are in construction at the present time. I do not believe that the Government can afford or would desire to abandon the enterprise at Muscle Shoals, because it has too much money invested there, and because of the fact that so much of benefit may come to the American people in the development of what has been undertaken.

It was suggested yesterday that you needed additional scientific information. About that I do not know. That is a matter for your committee to decide. But I do not know of any committee at any time that has apparently given more thoughtful, serious, and determined interest in an enterprise than this committee has, to try to determine what should be done at Muscle Shoals. Personally—and I imagine that is the opinion of the committee—I believe that you are not interested in men; you are interested in achievement; you have no personal concern that anybody shall be accepted or rejected, but that this committee of the Congress is anxious to do that which is in the interest of the American people.

There is vast power at Muscle Shoals which should be utilized. I think all concede that fact. It is the duty of the Government, it would seem to me at the present time, to develop that power and to carry out, through some kind of means, the enterprise which it has begun. Whether it will do it as a Government enterprise, or whether it should be done as an individual enterprise under Government control is a matter to be determined by the committee. Personally, I do not believe that the American people would be content if this enterprise were abandoned. In the next place, I do not believe they would be content if it were turned over to private interests without Government control and Government supervision. Some kind of a scheme ought to be worked out, as I see it, that would give the Government control, would retain the ownership of the title to the property in itself, and that no scheme should be adopted that is not in the nature of a lease.

I examined with considerable interest the bill that was introduced by the chairman of this committee, and with many parts of it I am in full accord. I know of his conscientious endeavor, his devotion to his duty, and his painstaking efforts to accomplish results in the interest of the people; and there are other members of this committee who are equally interested, equally conscientious, equally devoted to the discharge of the obligation resting on them. Mr. Levering has developed a plan which he believes is practical and which he is fully satisfied can be carried out. Under that plan there is to be ownership in the Government; there is to be part control by the Government, and there is to be constant supervision by competent Government officials. In the bill which he will propose later he starts out with your bill, Mr. Chairman, and instead of providing that it shall be conducted by a board of directors of three he provides for a board of directors of seven, three of whom shall be officials of the Government, one of these directors to be selected by the Secretary of Agriculture, one by the Secretary of War, and one by the Secretary of the Treasury. The other four will be named by the stockholders of the corporation which he proposes, a corporation with capital stock of \$5,000,000, \$1,000,000 of which must be paid in cash within 30 days, and the other \$4,000,000 of which must be paid in cash within 12 months. In addition to that, in order to protect the Government, he provides that this company shall give a bond for the faithful performance of the provisions of its agreement with the Government in

the sum of \$1,000,000, and that each one of the seven directors shall give a bond of \$25,000 for the faithful performance of his duty as a director.

This bill places the control of the sale and distribution of nitrates in the hands of the three Government directors.

The general business of the corporation will be done by the seven directors, each having the same power.

The bill provides a salary for each of the directors of \$12,000 per annum. The directors are limited to their salaries in emoluments.

The bill provides for a 50-year lease and payment to the Government annually of a sum which at the end of the 50 years will have fully paid every cent that the Government has expended on Muscle Shoals.

With reference to the power there is a provision which authorizes the Government to use that which will be necessary for its own uses and provides a limitation of cost.

The company will take charge of the construction, if the Government desires it, of the unfinished portions of the enterprise which were begun at Muscle Shoals, both for the generation of power and for the production of nitrates.

Now, Mr. Chairman, I have not gone into the details of this bill. It will be presented in regular form and you will want to examine it. I have only given you a general outline of the bill, and this bill is intended to safeguard the Government at every point and furnish, if the corporation is properly handled, a sufficient profit to satisfy investors to invest in the enterprise.

The bill provides that in the construction of the unfinished portions of the work, the work shall be done at a fixed sum on each of the enterprises, which sum is less than the estimates which have been made by the Government as to the cost of the completion of the dams and the nitrate plants.

Now, I believe that covers the proposition in a general way.

The CHAIRMAN. Have you a copy of the bill, Mr. Lloyd?

Mr. LLOYD. We have a copy of the bill, but it needs some little correction. In the first instances we prepared what would be a contract between the United States Government and the corporation, and then it was changed to the form of a bill, and in transcribing it portions of the contract are expressed in the terms of the contract rather than in the terms of the bill which would become a law, and those little changes, which are only small, we will fix up for you to-day.

The CHAIRMAN. Then you will hand it to the reporter and it can be printed in the hearings.

(The bill referred to is as follows:)

[S. 3585, Sixty-seventh Congress, second session.]

A BILL To provide for the manufacture of explosives for the use of the Army and Navy, to provide for the manufacture of fertilizer for agricultural purposes, to incorporate the Federal Chemical Corporation, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That there is hereby incorporated and created a corporation by the name, style, and title of the Federal Chemical Corporation (hereinafter referred to as the lessee). Said corporation shall exist and have succession for a period of fifty-five years after the passage of this act.

- (1) To adopt, use, and alter a corporate seal;
- (2) To sue and be sued and to complain and to defend in any court of law and equity within the United States;
- (3) To make and enforce such contracts as may be necessary to carry out the provisions of this act;
- (4) To appoint and fix the compensation of such employees, attorneys, and agents as are necessary for the transaction of the business of the corporation, to define their duties, require bonds of them, and fix the penalties thereof; but in no case shall any such employee receive a salary in excess of \$12,000 per annum;
- (5) To prescribe, amend, and repeal by-laws not inconsistent with this act for the conduct of its business; and
- (6) To exercise all the rights, powers, and privileges conferred upon it by this act, and such additional powers, including the right of eminent domain for itself and the Government, as may be necessary to carry out the provisions of this act.

SEC. 2. That the business of said corporation shall be transacted by a board of seven directors (hereinafter called the board), one to be selected by the

Secretary of the Treasury, one to be selected by the Secretary of War, and one to be selected by the Secretary of Agriculture. These three directors are hereinafter referred to as the Government directors, and are to hold office during the pleasure of the Secretary controlling the appointment. Any Government director may be removed from office at any time, either with or without cause, by the Secretary controlling the appointment.

SEC. 3. That the Government directors shall have the same powers as the other directors of the corporation, and in addition thereto they shall control the sale and distribution of the nitrates, fertilizers, and other products of lessee: *Provided*, That they shall not have authority to bind their successors as to the sale or delivery of nitrates or other products manufactured by lessee for the Government except upon the written authority of the three Secretaries controlling their appointments.

SEC. 4. That when the flow of the Tennessee River at Dam No. 2 is less than 25,000 second-feet the Government directors shall have authority to regulate the amount of water used by lessee to generate power at Muscle Shoals so as to conserve the water and protect and regulate navigation.

SEC. 5. That the Government directors shall not own, control, or in any way be interested in the stocks, securities, or profits of the lessee or receive from it any commissions, extra compensation, or perquisite, or from any transaction in which it is a party, other than the salary provided by law.

SEC. 6. That the Government directors shall give their time, exclusive of all other business, to their duties as members of the board and as representatives of the department from which they received their appointment.

SEC. 7. That the four members of the board, other than the Government directors, shall be selected at the annual meeting of the stockholders of the corporation, as provided by the by-laws, and shall hold office for one year or until their successors have been elected and qualified: *Provided*, That any member of the board may be removed at any time by a concurrent resolution of Congress.

SEC. 8. That the board shall select one of its members as president. It shall select a secretary and a treasurer and as many assistant treasurers as it deems proper. The treasurer and assistant treasurers may be corporations or banking institutions and shall give such security for the safe-keeping of the moneys of the corporation as the board may require.

SEC. 9. That the power required to amortize the capital and make the payments to the Government by lessee and for the operation and maintenance of the plant shall be used or sold by lessee.

SEC. 10. That the board can not create or incur any indebtedness, liability, or expense against the Government unless authorized by an act of Congress.

SEC. 11. That each member of the board shall give a bond, to be approved by the Secretary of the Treasury, in the sum of \$25,000 for the prompt and faithful performance of his official duties.

The salary of each member of the board shall be \$1,000 per month, payable monthly, from the receipts of lessee as an operating charge unless changed by an act of Congress.

SEC. 12. That in the appointment of officials and the selection of employees for said corporation and in the promotion of any such employees or officials no political test or qualifications shall be permitted or given consideration, but all such appointments and promotions shall be given and made on the basis of merit and efficiency. The board shall give publicity to any request, coming from any source, asking for any favor in behalf of any person or the promotion of any employee. Any member of said board who permits the use of political or partisan influence in the selection of any employee, or in the promotion of any such employee of said corporation, or who gives any consideration to political considerations in the official action of said board, or who, knowing that such political influence has been or is attempted, does not give publicity to the same, shall be deemed guilty of a misdemeanor and upon conviction thereof shall be fined in a sum not exceeding \$1,000 or be imprisoned not to exceed six months, or both such fine and imprisonment, and the conviction of any member of said board of the offense herein defined shall have the effect of removing such member from office.

SEC. 13. That the board shall make a full, complete, and detailed report of its operation as soon after the close of each calendar year as possible to the Congress of the United States. In addition to the report so made the Secretary of the Treasury shall, at least once each year, make a complete audit of all

the accounts and all the financial operations of said corporation, and shall include in his annual report to Congress a detailed statement thereof.

SEC. 14. That the principal places of business of said corporation shall be established by the board at or near Muscle Shoals, Alabama, and the city of Washington, D. C.

SEC. 15. That the capital stock of the corporation shall be \$5,000,000, divided into 50,000 shares of the par value of \$100 per share, all of which must be subscribed before execution of the lease, and at least \$1,000,000 of which must be paid in within thirty days thereafter, and the remaining \$4,000,000 or such parts thereof as may be required to transact the business of the corporation and to enable it to comply with the terms of this contract, must be paid into the treasurer of the corporation upon thirty days' notice, to be given by the Government directors.

SEC. 16. That by authority of this act and the execution of a lease hereunder the lessee may, within thirty days after the passage of this act, lease from the Government all the property, real, personal, and mixed, now owned or that may hereafter be acquired by the Government in connection with or forming part of the Muscle Shoals project, or the possession, use, construction, maintenance, operation, or extension of that project, or any part or appurtenance thereof, including all rights the Government has or may acquire to the steam plant located at Gorgas, Alabama, on the Warrior River, together with the connecting transmission lines. Said property is included or intended to be included and described in the maps, deeds, descriptions, invoices, lists, and schedules furnished to the lessee by the Government, and when receipted for by the lessee shall be a part of its agreement and bind both parties as truly as if they were written herein, and which are hereinafter referred to as the "property."

SEC. 17. That the lease is to continue in full force for a period of fifty years from the date the lessee acquires possession of that portion of the property located at Muscle Shoals. The lessee shall return said property at the termination of this lease to the Government in good operating condition, subject only to such damage or loss as may have resulted without the fault, action, or neglect of the lessee.

SEC. 18. That the lessee shall, for and in consideration of the lease, construction, operation, rights, privileges, payments, and other considerations herein-after mentioned or otherwise provided for in this act, construct all dams, power stations, and such other structures now under construction or agreed to be constructed by the lessee at Muscle Shoals, on the Tennessee River, in the State of Alabama.

SEC. 19. That the lessee must, within six months from the execution of the lease, submit plans and specifications for Dam Numbered Three, together with power station, locks or lifts, and other equipment, but will show an estimated increase of the primary hydroelectric power that could be generated under the present plans of Dam Numbered Two of not less than 30 per centum, and if such plans are approved by the engineer representing the Government, the lessee must build Dam Numbered Three, power station, and equipment, in accordance therewith, at actual cost without profit, or for a definite price of \$25,000,000, as set out in section numbered 38 hereof.

SEC. 20. That should the plans of the lessee for Dam Numbered Three be rejected by the Government engineer, and the Government offer other plans in lieu thereof, the lessee must build Dam Numbered Three, power station, and equipment at actual cost and under all conditions of this act, and such plans will become a part of the lease and bind both parties as though such construction, agreement, and plans were set out in this act: *Provided*, That the cost of maintenance, repairs, and replacement will be paid by the Government and not become a liability of the lessee.

SEC. 21. That lessee must either construct Dam Numbered One or in lieu thereof open a navigation channel from the railroad bridge below Muscle Shoals up to the locks or lifts at Dam Numbered Two, the cost of which is included in the construction cost set forth in section 38 thereof.

SEC. 22. That the lessee must construct for the Government the locks or lifts for the purpose of maintaining navigation over the dams to be constructed under this act, the cost of which is set out in section 38 hereof.

SEC. 23. That should the Government acquire, by litigation or otherwise, all adverse interest in the Gorgas power plant, transmission lines, and coal mines, that lessee must pay a reasonable cost to be approved by the Government

directors for not to exceed \$5,000,000, unless by special agreement between the Government and the lessee acquiring the title, and the lessee must operate such plant as a part of the Muscle Shoals property included in this act, and repayment will be made by the Government to lessee at the termination of the lease of such amounts as lessee may have expended in acquiring such title.

SEC. 24. That the lessee must operate and maintain for the Government, and under the authority of the Government directors, the nitrate plants now, or which may hereafter become, a part of the property, and commence refitting them to make the required fertilizer compounds as soon as the plans for the work have been approved by the Government directors, and when they have been refitted to operate them as hereinafter provided.

SEC. 25. That the lessee will make such alterations, additions, or changes in the nitrate plants, or any part of the equipment or structures operated under the lease, as may be required to produce the nitrates or other compounds requested by the Government directors: *Provided*, That such changes can be made for a total expense of not more than \$5,000,000, which amount is included in the construction cost set out in section 38 hereof. After the lessee has expended the \$5,000,000 it shall make such additions or changes from time to time as may be necessary to produce the required nitrates and compounds requested by the Government directors, and such changes when made on request of the Government directors shall become an operating charge and payable from the funds on hand derived from the sale of nitrates and compounds and power not required to operate the plants.

SEC. 26. That the lessee must furnish the Government directors copies of the plans and specifications of the proposed changes to be made in the nitrate plants to fit them to produce the compounds or other products required by the Government. Such alterations are to be so designed that the nitrate plants can be refitted to produce explosive compounds with the least delay and expense.

SEC. 27. That the lessee must maintain and operate a research department in cooperation with the Agricultural and War Departments of the Government for the purpose of developing the processes for the fixation of atmospheric nitrogen and the manufacture of such fertilizer or other compounds as may be required by the departments of Agriculture and War, the cost of research work to be charged to operating expenses of the plant.

SEC. 28. That said lessee must begin construction within sixty days from the time it is given possession of that portion of the property located at Muscle Shoals and to continue such construction in a diligent, businesslike, and workmanlike manner until the construction work provided for under this contract shall be completed according to terms hereinafter set forth, within the time prescribed in section 38 hereof.

SEC. 29. That if at any time during the construction, in the opinion of either the lessee or the Government engineers, any of the structures provided for in the plans have become, or are liable to become, weak, dangerous, uncertain, or inefficient, or their efficiency or utility may be increased, they may request changes, extensions, or additions to be made in the plans for the purpose of increasing the strength, stability, duty, endurance, or efficiency or usefulness of the dams, locks, power stations, or other structures to be built by lessee under provisions of the contract, such changes, extensions, or additions shall be submitted to the engineer representing the other party and to the surety companies furnishing the bond of the lessee and other constructors, and if such changes, extensions, or additions shall be approved by the engineer representing the other party and the surety companies, they are to become a part of the construction contract and binding on both parties and the surety companies as if originally written therein, but in no case shall such changes, extensions, or additions, when they have been approved by the Government, lessee, and the surety companies, add to the cost of the work or in any way change the dates and amount of payments provided for in this act.

SEC. 30. That should the request for changes, extensions, or additions in the plans for any of the purposes set forth in the foregoing section of this act have been approved by the surety on the bond of the lessee and other contractors, and not been approved by the engineers representing both the Government and lessee, then the questions of endurance or strength of such material or members as can be determined by physical test shall be submitted to the United States Bureau of Standards for final determination, and all questions as to the effect of the proposed changes, extensions, or additions upon the increase of strength, stability, duty, endurance, or efficiency of the dams, locks, power stations, or other structures to be built under the contract; also

the plans and specifications for the changes as requested shall be submitted to the engineering faculty of one or both of the following-named universities or schools of technology; Massachusetts Institute of Technology, Cambridge, Massachusetts; Cornell University, Ithaca, New York; and the report of such faculty or faculties, if submitted to more than one, together with the report of the Bureau of Standards, shall be final, and if such report of the Bureau of Standards and faculties of technical schools mentioned herein show that the proposed changes, extensions, or additions will materially increase the strength, stability, duty, endurance, or efficiency of the structure affected by the changes, extensions, or additions, then such changes, extensions, or additions shall become a part of the working plans of the contract, the same as if they were originally written therein or had been approved by the engineers of both parties and the surety companies without increasing the contract cost.

SEC. 31. That the cost of testing, consulting, or other expenses caused by the request for changes in the plans, as provided for in this act, shall be borne by the party making the request.

SEC. 32. That during the time of construction the Government and the lessee shall each designate an engineer to represent it on the work, and the acts of such engineer shall be binding as to the party designating him as a representative.

SEC. 33. That the lessee shall not be required to expend in the manufacture of nitrates or other fertilizer compounds or other products any money other than that received from the sale of the products of the nitrate plants, plus the amount received from the sale of power in excess of that required to operate the plant.

SEC. 34. That the lessee shall sell fertilizer compounds produced by the plant at the price and terms that may be fixed by the Government directors.

SEC. 35. That should the development of power for use and sale from this plant, together with the receipts from the sale of its products, be insufficient to produce the amount of fertilizer compounds or other products requested by the Government, necessary to meet its requirements, the lessee agrees to construct under special contract other power plants upon sites owned by the Government and selected by the Secretaries of War and Agriculture and itself, said plants to be construed and operated under the general terms of this act for the purpose of enabling the lessee to comply with the Government requests. And the authority of the contract shall include all such sites but shall not require the Government to incur any further liability or expense.

SEC. 36. That all investments made by the lessee for the purpose of complying with the requirements of this act, and the protection and maintenance of the property, excepting the construction work set out in paragraph 18 of this contract, or other work specially contracted for, shall, unless otherwise provided, become the property of the Government at the expiration of the lease upon paying the lessee the amount invested.

SEC. 37. That the lessee shall have the right to place any desired improvements on the leased property for its own use and at the expiration of the lease the Government will either purchase such improvements at the actual value or allow the lessee to remove the same.

SEC. 38. That the lessee shall build Dam Numbered One, or in lieu thereof to open a channel for navigation from the railroad bridge below Muscle Shoals to the locks or lifts at Dam Numbered Two, for the sum of \$4,000,000.

The lessee shall complete and equip Dam Numbered Two ready to generate, in conjunction with Dam Numbered Three, not less than six hundred thousand horsepower for \$23,000,000.

The lessee shall build Dam Numbered Three as set out herein for \$25,000,000.

The lessee shall build the locks or lifts to maintain navigation over the dams for \$3,000,000.

The lessee shall reconstruct and extend the nitrate plants not to exceed in expense the sum of \$5,000,000.

SEC. 39. That the construction by the lessee, authorized by this act, shall commence within sixty days after it is given possession of the property located at Muscle Shoals and it shall continue such work in a diligent, business, and workman like manner until the construction work provided for under this act is completed, as herein set forth. Within two years the hydroelectric plant shall be equipped and ready to generate one hundred thousand horsepower. And within three years from date of possession by the lessee the plant shall be equipped and ready to generate two hundred thousand horsepower; and within five years from date of possession by the lessee the plant shall be

ready to generate six hundred thousand horsepower, and the construction shall be complete in all details as set forth and described in the plans and specifications which are a part of the contract between the Government and lessee.

SEC. 40. That the lessee shall purchase, at a total cost of not more than \$5,000,000, the title or easements to the land that will be submerged or flooded by the construction of the dams mentioned in this act. All such expenditures shall be approved by the Government directors and shall be repaid to the lessee at the termination of the lease authorized by this act.

SEC. 41. That whenever nitrates can be made at a profit, or when the cost of the same has been so reduced that the funds arising from the sale of excess power and fertilizer compounds or other products are not needed in whole or in part for financing such productions as herein provided, or upon request of the Government directors, the said funds, or any part thereof, shall be paid by the lessee into the Treasury of the United States.

SEC. 42. That the engineer representing the Government shall on the first of each month give the lessee an estimate of the work performed, material furnished, and expenditure authorized by the contract and a statement of the amount earned by it during the preceding month and the amount due lessee from the Government.

SEC. 43. That payments under the contract authorized by the act are to be made monthly in cash by the Government unless it should issue bonds for the construction work. Then the lessee will receive such bonds, including accrued interest, in payment for any of the obligations incurred by operation of the contract in lieu of cash at the market value at the option of the Government.

SEC. 44. That all stores, supplies, equipment, and loose personal and floating property, including all engineers' supplies, instruments, and files, now on or about the premises shall be included in the lease.

SEC. 45. That the lessee shall have the right to sell or exchange at its discretion all worn, useless, or excess personal property and shall use the proceeds to purchase other supplies required to operate the plant or for such other purposes as may be approved by the Government directors, and will, at the termination of the lease, deliver to the Government all property on hand which may be needed to operate the plant.

SEC. 46. That the lessee shall retain the proceeds received from the sale of power not required for Government use, and the tolls received from the Government for power consumed by it in excess of eight hundred and seventy-six million horsepower hours during any one calendar year, exclusive of the power required to operate the locks or lifts. One-half of the net receipts received by the lessee in excess of \$250,000 from the sale of power or tolls from the Government or other sources during any one year shall be used to finance the production of compounds or other products, or paid into the United States Treasury, as requested by the Government directors.

SEC. 47. That lessee shall operate and maintain the hydroelectric and steam plants for the compensation set forth in this act, except the cost of fuel, which shall be charged against the sale of power, and is to be paid by the consumers of power in proportion to the amount used.

SEC. 48. That should the Government require more than one hundred thousand horsepower exclusive of the power to operate the locks or lifts, it will, unless in times of emergency, give the lessee six months' notice to furnish the estimated increase of power, provided it can be furnished without interfering with any valid contracts for the sale of power. The lessee shall receive 1 mill per kilowatt hour for the extra power so furnished, which shall be full compensation for all loss or damage sustained by the lessee by reason of the diversion of the power to the use of the Government. And the lessee shall continue to operate the property at its own expense exclusive of the cost of fuel.

SEC. 49. That all necessary expenses, including reasonable attorneys' fees, incurred by the Government and required to perfect and enforce its rights to the possession and enjoyment of any portion of the property included or intended to be included in the lease authorized by this act, or in acquiring land for the development or operation of the property, shall be charged to the construction account of the project, and not to be included in the construction cost set out in section 38 of this act.

SEC. 50. That the lessee shall place the property, or any part thereof, at the disposal of the Government in the event of war or any other public emergency, and during the period the plant is not operated by the lessee the proceeds from the sale of excess power to be paid into the United States Treasury.

SEC. 51. That after the completion of Dam Numbered Three in accordance with plans that have been approved by the lessee, it will sell or use not less than two hundred and fifty thousand horsepower of primary power, and at an average of 2 mills per horsepower hour.

SEC. 52. That the lessee shall give to the Government for its protection a good and sufficient surety bond in the sum of \$1,000,000, to be approved by the Secretary of the Treasury, for the faithful performance of the provisions of the lease authorized in this act, and which shall be renewed every five years. In event the bond is not renewed at the expiration of any five-year period, or for any other reason becomes uncertain or inefficient, and the lessee fails to renew the security after ninety days' notice, then this lease shall terminate and the Government may take possession of the property without further notice or delay: *Provided further*, That the lessee may deposit with the Treasury of the United States cash or Government bonds of the market value of \$1,000,000 in lieu of a surety bond.

SEC. 53. That should the lessee operate other dams or storage reservoirs than those included in the lease, the waters of which will discharge into the Tennessee River above the dams of the Muscle Shoals project, it will have the right during the period of the lease to pass such discharge waters through the power stations of the Government plant upon payment of one-half mill per kilowatt hour for the power so generated: *Provided*, That such use will not hinder or reduce the capacity of the hydroelectric-power stations.

SEC. 54. That the Government experts, inspectors, and accountants can at all reasonable times examine the books, papers, accounts, meters, and such other accessories of the plant necessary to satisfy them whether or not the lessee is executing the lease in good faith and capacity.

SEC. 55. That any time after five years from the date of possession by lessee the Government may, after giving six months' notice to the lessee of its intention, terminate this lease upon the same terms and conditions as if it had expired by limitation, and in addition thereto pay the lessee the sum of \$50,000 for each year of the unexpired term of the lease.

SEC. 56. That the lessee shall not, in whole or in part, sell, transfer, sublet, or delegate its rights, interests, or authority in this lease except to the Government.

SEC. 57. That the lessee shall use or sell all primary power that can be generated by the hydroelectric plants, supplemented by a reasonable use of the steam plants, and now or hereafter included in the lease, in excess of the one hundred thousand horsepower required to operate the plant, such use or sale to be under the terms and for the period of the lease.

SEC. 58. That should the present foundation of Dam Numbered Two be found defective or show excessive leakage during the five years succeeding the execution of the lease, the Government will pay to the lessee the expense of the necessary repairs, including a reasonable allowance for overhead.

Senator HEFLIN. Who is to be the head of your corporation, Mr. Lloyd?

Mr. LLOYD. I don't know. I explained at the outset that I had no personal knowledge of anything, or of any interest, because I was not connected with any interest, and I do not appear here for anybody, and if I did appear for anybody, or if it appeared that I did, it would be for Mr. Levering, and I explained in the outset, before you came in, Senator Heflin, how I happened to come in contact with him.

I have no employment as attorney at all, and no prospect of employment, and no prospect of compensation in any way, so far as I know.

Senator HEFLIN. What is this offer? What does the offer that you provide for amount to in dollars for the use of the—

Mr. LLOYD (Interposing). The construction cost is \$60,000,000, including everything; including the plants and dams.

Senator HEFLIN. You provide that the Government should furnish that \$60,000,000?

Mr. LLOYD. We provide that the Government shall furnish the \$60,000,000; yes, sir.

Senator HEFLIN. After that is done, what does this offer that you provide for amount to in dollars for the use of this property that should be leased to this corporation?

Mr. LLOYD. Well, it will amount to something like \$3,000,000 a year.

Senator CARAWAY. Mr. Lloyd, if Congress were to hold up this enterprise, pass this act, what assurances have we that anybody financially responsible would come forward and take up this proposition?

Mr. LLOYD. As far I am individually concerned, I said at the outset that I had none. You may find out from Mr. Levering. He may know, and I rather suspect he does, but he has not revealed it to me. I don't know who it is.

Senator CARAWAY. This does not amount, then, to one of the measures that is designed to delay final action?

Mr. LLOYD. No. There is no intention to delay immediate action.

Senator CARAWAY. I am not accusing you of having any such intention, but will not that be the effect?

Mr. LLOYD. No; I think not. I feel very sure that this can be carried out and that the money will be forthcoming to purchase the stock.

Senator CARAWAY. Personally, I have been of the opinion all the time that all these many offers were brought forward by people to delay final action.

Mr. LLOYD. I want it distinctly understood that I have no such intention.

Senator CARAWAY. I do not accuse you of it, but I think the facts are that a great many of these propositions are put forward with the idea of preventing final action.

Mr. LLOYD. Senator, if I thought that Mr. Levering was undertaking to defeat or delay, I would have nothing to do with this matter at all.

Senator CARAWAY. Oh, I am sure of that; but what impresses me is that nobody ever made a suggestion of the use of this until now there is some chance of doing something with it, and everybody brings forward a new plan and a new bidder; which has raised in my mind, I am frank to say, and I think everybody with whom I have discussed it believes that back of it all in some way or other there is an influence that does not want it developed.

Mr. LLOYD. That may be. I do not question that. I do not know whether that is true or not, but I would suppose that it is true that each of you realizes that this is a very important matter and you want to get all the light you can.

Senator CARAWAY. Oh, yes, sir.

Mr. LLOYD. Any information that can come to you, if it is beneficial, in the way of suggestion, you would be glad to have. That is the interest I have in it as an individual. I am anxious to see something done that brings about the results and accomplishes the benefits which I mentioned before you came in. We are interested in three things: Navigation of the Tennessee River, the development of power, and the furnishing of nitrates in time of war to the Government and in time of peace to the people in different localities.

Senator CARAWAY. Oh, yes. Agriculture in certain sections of this country is going to perish if we do not do something.

Mr. LLOYD. I am exceedingly anxious about the nitrate proposition, and as an individual I am frank to say to you that I am more concerned in the nitrate situation and its fertilizer use by the farmers of the country than I am in any other end of the business.

Senator CARAWAY. So am I; and I, having seen things like the Panama Canal, for instance, held up almost half a century by interests that never did disclose their real purpose, have an impression that that is likely to be the case here.

Mr. LLOYD. There is some truth in that, because I know something about that legislation. I remember very well how long and how faithfully the Senator from Alabama worked.

Senator HEFLIN. Senator Morgan.

Mr. LLOYD. There is no man, I think, that deserves, from a statesmanship standpoint, a better monument than Senator Morgan for his splendid efforts to bring about the construction of the Nicaraguan Canal—not the Panama Canal.

Senator CARAWAY. Which resulted in this Panama Canal that we got.

The CHAIRMAN. While he labored very faithfully, he failed in getting, in the end, what he thought we ought to have.

Senator HEFLIN. That is exactly what he wanted, but his efforts resulted in having this canal constructed.

Senator CARAWAY. I think we are traveling in the same old channel.

Mr. LLOYD. Oh, I am not so sure, Senator. I was on the ground at the time. I am not so sure but what the Nicaraguan Canal would have been talked about yet if it had not been for the extraordinary efforts that were made by the then President taking the matter in his own hands.

Senator CARAWAY. I am satisfied if we had just let the people who were objecting to any construction except in their way continue we would have been arguing it to-day and twenty-five years from now; and the fertilizer trust will be presenting to us arguments why this Muscle Shoals ought not to be improved except this way or that way, and there will be forty different ways.

Mr. LLOYD. I think you will find that now. I think you will find some people who will say that is not the place for a nitrate plant. You have heard that, I think, intimated before the committee.

Senator HEFLIN. And I don't think there is a more desirable place in the world.

Senator CARAWAY. I know nothing against it except it is in Alabama.

Senator HEFLIN. Probably he thinks if it was in Arkansas it would be better.

Mr. LLOYD. What I would like to see, and which would settle the difference between these two Senators across the table would be its location out in Missouri.

Senator HEFLIN. You do not provide anywhere in your contract for the manufacture of fertilizers?

Mr. LLOYD. Oh, yes. I mentioned that; but when the bill is submitted, you will then see just what the bill proposes.

Senator HEFLIN. You mean that will be set out in the contract? You just state now what you are willing to do?

Mr. LLOYD. Yes, sir.

Senator HEFLIN. Well, that is the way Mr. Ford has done. Of course, they say here frequently that he does not say here what he will do, but he states what he is willing to do, and the contract itself will state what he has to do.

Senator CARAWAY. I was impressed with one feature of your bill—the salaries of it and the fact that they are limited.

Mr. LLOYD. The salaries are paid by the lessees.

Senator CARAWAY. Yes; I know they are, and they are limited.

Mr. LLOYD. You mean by that they are not excessive?

Senator CARAWAY. I would not say that. It has got so that anybody who is hired by the Government must have more than others.

Mr. LLOYD. It seems to me in the light of modern development that Congress would think a \$12,000 salary is a very modest one.

Senator NORBECK. It is hard for us Senators to admit that anybody should have any more salary than we have. We are prone to measure it by our own.

Mr. LLOYD. As far as I am concerned on that proposition, as far as I am concerned as a citizen and knowing something about what you people have to pass through, I would change the salary of every Senator and Member of the House to at least \$12,000.

Senator CARAWAY. I reckon you would change most of them before you would change their salaries.

Mr. LLOYD. No, sir; I am not so sure I would. It may be, now that we are going into an economical period, it might cause trouble, but I was in the House when we changed the salary from \$5,000 to \$7,500, and it was understood at that time that the men who voted for the additional increase of \$5,000 to \$7,500 would stay at home; and if there was any man who stayed at home on account of the increase of salary I do not know who he is.

Senator CARAWAY. That is not what I said.

The CHAIRMAN. All right. If that is all we are very much obliged to you, Mr. Loyd.

(Whereupon, at 1 o'clock p. m., the committee adjourned until to-morrow, Thursday, May 11, 1922, at 10.30 o'clock a. m.)

MUSCLE SHOALS.

THURSDAY, MAY 11, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in the hearing room of the Committee on Commerce, United States Senate, Capitol Building, Senator George W. Norris, presiding.

Present: Senators Norris (chairman), Keyes, Norbeck, McKinley, Kendrick, Harrison, and Heflin.

The CHAIRMAN. The committee will come to order, gentlemen. Mr. Marsh is here, and I believe he was to be heard this morning.

**STATEMENT OF MR. BENJAMIN C. MARSH, MANAGING DIRECTOR
FARMERS' NATIONAL COUNCIL, BLISS BUILDING, WASHINGTON,
D. C.**

The CHAIRMAN. You may proceed, Mr. Marsh.

Mr. MARSH. For the record, my name is Benjamin C. Marsh, and I appear as managing director of the Farmers' National Council, with headquarters in the Bliss Building, here in Washington.

Mr. Chairman and gentlemen of the committee, I confess that I am not an expert on fertilizer manufacture or anything of that sort, but the issues involved in this bill are very important. The manufacture of fertilizer is solely an incident; it is almost a negligible incident.

Senator KEYES. You spoke of "this bill." What bill do you refer to?

Mr. MARSH. The Ford proposal.

Senator KEYES. All right.

Mr. MARSH. I should have said, perhaps, Mr. Ford's contract.

The CHAIRMAN. Mr. Marsh, we have before us the bid of Mr. Ford, the bid of the Alabama Power Co., the bid of Mr. Parsons and the bid of Mr. Engstrum, and the bill that I have introduced. All of those things are pending before the committee in these hearings, and we will be very glad to hear you on any one of them or on all of them.

Mr. MARSH. I appreciate your setting me right, sir. I thought it was particularly Mr. Ford's proposition that you were discussing.

The CHAIRMAN. Well, there has been a great deal said about Mr. Ford's bid, of course, but that is not the only thing that we are considering here.

Mr. MARSH. I shall not attempt to analyze the others, but I shall analyze Mr. Ford's bid. Really, the most important thing involved is what the nation is going to do with its water power. That is one of our great natural resources.

Let me state that the Farmers' National Council indorsed the plan before Congress a year and a half or so ago, to have the Government develop water power at the Muscle Shoals project, and also, as an incident thereof, to manufacture fertilizer.

The CHAIRMAN. Those organizations then were in harmony at that time with the other farm organizations?

Mr. MARSH. We were entirely in harmony with them, and much in advance of them in our viewpoint on the question of natural resources. We regarded that as one of the methods of securing at least partial conservation of our natural resources. We based our position on the fact that the council, which is a special union of national and State farm organizations to carry out a legislative program, at its meeting here in Washington in January, 1919, adopted

the following plank on natural resources which, with your permission, I would like to read, as it is brief.

The CHAIRMAN. All right.

Mr. MARSH. It is as follows:

"NATURAL RESOURCES.

"The natural resources of the country, now in public ownership—coal, iron and copper ores, water power, timber lands, phosphate deposits, peat, ash, gas, oil, etc.—are worth hundreds of millions of dollars. It is a solemn obligation devolving upon the country not to alienate any more of these natural resources either by patent or by lease, but to develop and hold them in trust for this and succeeding generations. Such of these natural resources as are now in private ownership should be acquired by the government at the earliest possible opportunity, payment to be only for actual and prudent investment."

We were very conservative in estimating the natural resources still in public ownership at hundreds of millions of dollars. I think, if we had put it at scores of billions we would probably be more nearly accurate.

Now, I simply want to say a few things, or quote a few statements, rather, from a very eminent conservationist, Dr. Charles R. Van Hise, who, almost up to his death, a year or so ago, was president of the University of Wisconsin at Madison. Doctor Van Hise, in his book on *The Conservation of Natural Resources in the United States* discusses the control of water powers, which, of course, is vitally connected with this bill, and directly connected with it.

I would like to quote just a few of his statements. He says:

"Water powers should be controlled by the public"—

The CHAIRMAN: Give the page there.

Mr. MARSH. Page 133.

"Water powers should be controlled by the public; I do not say owned or operated by the public. The elastic word 'controlled' is used because the amount of control which is advisable or necessary is different in different cases. The North American Conservation Conference of 1909, composed of commissioners from the United States, Mexico, Canada, and Newfoundland, agreed unanimously upon the principles which should obtain as to the control of water powers. Therefore these principles may very well serve as a starting point in the discussion of the subject. 'We regard the monopoly of waters,' said the commissioners, 'and especially the monopoly of water power as peculiarly threatening. No rights to the use of water powers in streams should hereafter be granted in perpetuity. Each grant should be conditioned upon the prompt development, continued beneficial use, and the payment of proper compensation to the public for the rights enjoyed; and should be for a definite period only. Such powers should be no longer than is required for reasonable safety of investment. The public authority should retain the right to readjust at stated periods the compensation to the public and to regulate the rates charged to the end that undue profit or extortion may be prevented.'"

I will not read the whole of that.

Senator MCKINLEY. Mr. Marsh, do I understand that you indorse that?

Mr. MARSH. I indorse the principle that there should be at least control, and I would like to point out that, it seems to me, under Mr. Ford's offer there is not adequate control, and I am opposing that offer of Mr. Ford's on that score. I urge very strongly that the Government should retain all these water powers and the plants constructed there and develop water power itself. I will develop my reasons for that a little later, Senator McKinley. I am glad you raised the question.

I have seen all of these other bills, but I have not studied them as carefully as I have Mr. Ford's, believing that Mr. Ford is the one that had the chief consideration of this committee. None of these bids, if generally applicable, protect the public adequately, it seems to me.

This book, I might state, was published in 1912, and I remember that Colonel Roosevelt had Doctor Van Hise down to see him at Oyster Bay shortly after this book came out and they discussed the whole program of conversation together.

Senator MCKINLEY. Do you feel that the Federal water power act protects the public, Mr. Marsh?

Mr. MARSH. No; I do not think it does. I think we have to get control of the water powers of the Nation and they have to be developed absolutely for service and there must not be any private profit in the development of any of them.

because our coal and oil are going, and our water power in a large measure has to be relied upon in the future as motive power, and very cheap motive power. Of course, it is not universally available. We have some coal left, but, nevertheless, water power is, in a large measure, a continuing and more nearly inexhaustible natural resource than either of the others. Our oil is rapidly disappearing.

Senator MCKINLEY. Then, you would think it wrong to tie it up in anyone's hands for 100 years?

Mr. MARSH. Yes. The Farmers' National Council, in the meeting that we held here when this so-called agricultural conference was held in Washington last January, indorsed only the general principles of the Ford plan as an effort to get cheap fertilizer. We did not indorse the details of it. I was unable to get a copy of the contract until recently, and I think very few farmers have seen the contract.

The CHAIRMAN. You are now speaking of Mr. Ford's bid?

Mr. MARSH. Yes; Mr. Ford's contract or bid.

The CHAIRMAN. Yes.

Mr. MARSH. Mr. Ford's proposal.

The CHAIRMAN. Yes; we just want to understand which offer you are speaking of.

Mr. MARSH. Very few farmers have read it, and very few farmers have had the time to analyze it carefully, and I am going to take up later, with your permission, my reasons for thinking it will not assure cheap fertilizer, and I shall quote from the report of the Federal Trade Commission on the fertilizer industry situation. Needless to say, we want cheap fertilizer for the farmers. That is unquestionably an essential thing. Let me read further from Doctor Van Hise's book, on page 135:

"First. Public control is necessary to secure reasonable charges.

"Herbert Knox Smith, commissioner of corporations, states that already a large proportion of the water powers, especially the best and largest ones, are owned by a few corporations. He says that the General Electric Co. controls at least 250,000 horsepower and partly controls 420,000 more; that the Westinghouse Co. controls absolutely 180,000 horsepower and partly controls 100,000 additional; that 11 other companies control 875,000 horsepower—making a total in the control of 13 companies of 1,825,000 horsepower, or more than one-third of the entire development of the United States. Not only do these companies control adjacent powers, but by a system of coupling up they obtain a high state of efficiency. Since it is advantageous to have the power uniformly used and the call for the maximum amount of power occurs at different times in different places, by coupling up a large number of plants a much higher average use of the power is possible than if each plant were separately operated. This concentration is economically advantageous. Therefore, conservation requires us to encourage concentration and coupling in order that we may get the greatest efficiency of the water; but if we permit this, the users can only be protected by public control. Hence the conservation principles with reference to water powers are concentration and public control."

I might insert also that Doctor Van Hise's book on Concentration and Public Control, published, if my memory serves me right, three or four years after this book, The Conservation of Natural Resources of the United States, was published, discusses very thoroughly Federal control over these water-power companies and corporations doing an interstate business.

Continuing on page 136, Doctor Van Hise says:

"Also Herring says in reference to California—this is a quotation from Application of Water Power, by W. E. Herring—'on four of the rivers in northern California, where there is a possible development of over 800,000 horsepower, only 20,000 has been actually utilized, while speculative water rights are held on these streams from which over 566,000 horsepower could be developed; or, in other words, 75 per cent of the power possibilities on these streams have been alienated from public ownership and less than 2 per cent utilized for useful purposes.'"

In this connection I would like to say that I have not the details here, as I overlooked to bring with me a short description of the great campaign that is now on in California, which was explained to me by Mr. William Kent when I was out there last fall. Mr. Kent, Mr. Spreckels, the labor organizations, and the progressive farm organizations are all backing the movement to have the State invest hundreds of millions of dollars in retaining control and developing their own water power out there, as an asset which they should not permit to

be alienated at all from the State, and which should be developed, in their judgment, for the advantage of the entire public.

Continuing Doctor Van Hise's own statement, not that of Mr. Herring—and this is my last quotation:

"Therefore the economic advantage which comes from large holdings and from coupling, combined with the fact that monopoly of water power does already exist in various parts of the country, and is likely to exist elsewhere in the near future, make it absolutely necessary for the public to control the prices which may be charged for water power. The companies must not be allowed to decide the rates which they levy. If this be done extortion will be practiced."

Now, the question came up in connection with your hearings previously on all of these proposals with reference to Muscle Shoals as to whether or not the Government should control the prices of products of factories which might use any of the water power developed under Mr. Ford's proposal, assuming that it is adopted. It would seem to me that there are two distinct propositions there. It would seem to be the function of the Government, under a public commission—and when I speak of the Government I mean the Federal Government—to control the charges for motive power to be supplied by this natural resource, by this water power, but that commission could not go into the extremely complex and somewhat difficult task of controlling the charges of a hundred or five hundred or a thousand different kinds of manufacturing concerns using this water power.

You will remember that Mr. Herbert Knox Smith, when Commissioner of Corporations, advocated something which the Federal Trade Commission has advocated since—that is, the principles of what is known as the Steele bill, now before the House, should be adopted in reference to these corporations engaged in interstate commerce. It would permit them to take out an elective license. If they elect to take out a license from the Federal Trade Commission—corporation engaged in interstate commerce—and complied with the regulations and requirements of the Federal Trade Commission, they are not subject to prosecution under the Federal antitrust law. If they decline to avail themselves of the opportunity to take out such an elective license, then they are subject to prosecution. Of course that is another proposition, but I do not think it is fair to say that because the Federal Government would not control the charges which are made for electrical power or for shoes manufactured by a factory the machinery of which was driven by power derived from one of these federally operated electric power plants that the system is not sound.

The Federal Government has to retain those natural resources, and its responsibility as to these resources ends when it assures equal access at reasonable rates to the power generated through these natural resources by the Government.

Now, taking up Mr. Ford's proposal, I do not want to be understood as in any way invidiously criticizing Mr. Ford, but I can not help thinking of what my old college professor told me out in Grinnell, Iowa, when I was a junior in college. It is something I have never forgotten. He said to our class one day, "A benevolent despot is the most dangerous of despots; he is absolutely honest, and you forget to watch him."

Now, Mr. Ford is absolutely honest. I have studied Sir Conan Doyle's works and articles on spiritism, and I can not believe that Mr. Ford, after he has passed hence, can, 20 years from now, say, from the spirit world exercise any control over this corporation which is to be created. I have no doubt he would like to do it, and I can conceive that the American Farm Bureau Federation, which is so far removed from contact with the real farmers of America, might construe it that he would have that supernatural ability; but the ordinary farmer, who gets up in the morning and dresses himself and has to make his own living, will not accept that theory. They know that a corporation is a corporation, and while we believe in the transmission of traits and are willing to assume that Edsol Ford has inherited all of the splendid principles of his father, it is the question of principle that is involved; and I will say right here that the best investment that the water-power companies of America could make would be to pay a million dollars a year to any farm organization to smash and defeat the conservation policy by establishing a precedent such as would be established in this offer of Mr. Ford's, if accepted. Mr. Ford has not done it for that purpose; I concede that very frankly. But let me go through this with you a little, if I may. I will not take time to go into all of it.

I understand, too, that the Military Affairs Committee of the House has a series of subcommittees going over each of these sections, and it probably will not be quite the same as this when it comes out.

Section 1 reads:

"For the purposes of carrying out the terms of this agreement, the undersigned will form a corporation (hereinafter referred to as the company) with a paid capital stock of not less than \$10,000,000"—

And that last clause, "with a paid capital stock of not less than \$10,000,000," is inserted in typewriting, while the rest of it is printed.

"* * * to be controlled by the undersigned, which company will immediately enter into and execute all necessary or appropriate instruments of contract to effectuate this agreement."

Then, section 2 reads:

"The company shall complete for the United States the construction work on Dam No. 2, its locks, power house, and all necessary equipment, all in accordance with the plans and specifications prepared or to be prepared or approved by the Chief of Engineers, United States Army, and progressively install the hydroelectric equipment in said power house adequate for generating approximately 600,000 horsepower, all the work aforesaid to be performed as speedily as possible at actual cost and without profit to the company; it being understood that the necessary lands and flowage rights, including lands for railway and terminal connections, have been or will be acquired by the United States."

In other words, it looks to me as though we were sort of giving him a gift of 600,000 horsepower here.

I would like to say right here that I would like to know whether the Farm Bureau proposed this to Mr. Ford or whether Mr. Ford proposed this to the Farm Bureau? That is a question which I think could be answered.

I know this, that Mr. R. F. Bower has been working very hard on the Ford proposal; and I like Mr. Bower personally very much, but he has been a lobbyist for water-power companies. I think he was connected with some fertilizer companies. If I am not correct in that you can correct me, but it is nothing in derogation of a man's character to be working for some fertilizer companies at all. He ought to know a whole lot more about the fertilizer business than I do, but I will bring that up a little later in criticizing this paragraph.

Senator HEFLIN. He impressed this committee as knowing a whole lot about it, or at least he so impressed me.

Mr. MARSH. He does know a whole lot about it, unquestionably. Therefore I am rather surprised at the position he takes. If he did not know anything about it I could understand some of his statements, but he says he is an expert.

I need hardly remind you that the American Farm Bureau Federation indorsed the Cummins-Esch law, which has robbed the farmers of \$750,000,000 a year, and now they are getting all het up, so that they have to refresh themselves with an ice box, over a saving to the farmers of 10 or 15 million dollars a year, possibly 25, in fertilizers, while they let Wall Street rob them of \$750,000,000 a year under the Cummins-Esch law.

Senator HEFLIN. I am glad you mentioned that, because I see there are others that think Wall Street is working on the people constantly as well as I do.

Mr. MARSH. Yes, sir. Wall Street is in that respect like the Lord—it never slumbereth or sleepeth.

Senator McKINLEY. Is there anything to indicate—

Mr. MARSH. And let me add that it is the only respect in which it is like the Lord.

Senator McKINLEY. Do you think there will be anything in the course of the next 5 or 10 or 20 years to prevent Wall Street from getting possession of \$10,000,000 of stock of this company and control it?

Mr. MARSH. Frankly, I can not see that there is. It would not be possible during the lifetime of Mr. Ford.

Senator McKINLEY. I do not think so either. I think he is absolutely honest.

Mr. MARSH. Yes; I think so, too; but we have to recognize that 10 years is a short time in the life of a corporation, and we are dealing with the principles involved. A great effort is being made by these financial institutions to secure control of our natural resources. They have frittered away and wasted the coal and oil. They have made hundreds of millions of dollars without any corresponding or commensurate reduction in price to the users. They see those natural resources are going—particularly the oil. Of the coal, we have enough to last for years and years; but they see, too, that if they can get access on

a hundred-year basis—and that is not all; this is not a hundred-year contract. and I will read you another paragraph to show you what is involved in this—they see that you are abolishing the program of conservation for which all of the intelligent, 100 per cent Americans of this Nation have been working, and you are substituting therefor a precedent for dissipating all of our natural resources.

Senator McKINLEY. In speaking of oil, Mr. Marsh, is it not a fact that frequently disinterested men, men who have no idea of any connection with the Standard Oil Co. getting control of anything, organizing a company, and in the course of a few years something happens to them, and the stock of this company turns up in the control of the Standard Oil Co.?

Mr. MARSH. Yes; because, as Doctor Van Hise has put it, you have got to have concentration; you have to have monopoly in the development of most of these resources, to assure efficient and economical management. One great evil of our coal industry to-day is that it is utterly chaotic. It is not the fault of any one individual. I blame the coal operators not so much for the present condition of the coal industry as for the fact that they are fighting desperately in an effort to prevent the establishment of order and real business efficiency in the development of the coal industry. Of course, admittedly, they have done a lot of wicked things.

If the American Farm Bureau Federation were interested in the conservation of natural resources, I fail to see why it should not indorse the Kenyon-Newton coal bill, which, for the first time, permits the Government to take control over the development of the coal industry, and it makes the Federal Trade Commission an agency to assure continuous publicity of what they are doing.

Senator McKINLEY. Most of the trouble arising in the mining of coal is due to the fact that nobody has control of that industry.

Mr. MARSH. The price which the manufacturers have to pay for coal is one thing that has influenced the prices farmers pay when buying the things which they need.

Incidentally, speaking of this wonderful provision of the American Farm Bureau Federation, they have come out and indorsed the ship subsidy steal, if you please, which is going to stick the farmers for at least \$150,000,000 to \$200,000,000 a year. I appeared before the committee the other day, and the New York Times, which has a deadly hatred for me and acknowledges it, quotes me this morning editorially as saying it is an ocean-going pork barrel, and it said that I did speak for a class to whom Congress pays a whole lot of attention.

Now, here is a statement which I think Mr. Ford can not realize is in this proposal which he makes, and I therefore hope that it can appear in this record whether the Farm Bureau Federation proposed this proposal to Mr. Ford or whether Mr. Ford proposed it to the American Farm Bureau Federation, and I am going to call your attention to one of the reasons why the previous bill for the Government development of this water power down there—I am speaking of the general project, because I have not studied the differences between Dam 1 and Dam 2 and Dam 2, etc., but one reason that they failed was because they impugned the honesty of those Members of Congress that would not vote for the Government to put a lot of money into a specific plant, for which they got the verbal castigation of their lives. I remember Congressman James Frear, than whom there is no more honest man in America, said that he objected to having his integrity impugned by anybody because he would not vote for a big appropriation.

Here is a fact which I think ought to be called to your attention. This is spoken of as a 100-year lease. It is more than that. I will read section 3 and then turn to section 17. Section 3 of Mr. Ford's proposal reads, and I will read it in part only:

"The company will lease from the United States Dam No. 2, its powerhouse and all of its hydroelectric and operating appurtenances except the locks, together with all lands and buildings owned or to be acquired by the United States connected with or adjacent to either end of the said dam, for a period of one hundred (100) years from the date when structures and equipment of a capacity of one hundred thousand (100,000) horsepower are constructed and installed and ready for service"—

I will stop there and will take up the terms later.

Then, in section 17 of the proposal, it says:

"In order that the said company may be supplied with electric power and the farmers with fertilizers after the termination of the said 100-year leases should

the United States elect not to operate said plants, but determine, to lease or dispose of same, the company shall have the preferred right to negotiate with the United States for such lease or purchase and upon such terms as may then be agreed upon. If said leases are not renewed, or the property covered thereby is not sold to said company, its successors or assigns, any operation or disposal thereof shall not deprive the company, its successors or assigns, of the right to be supplied with electric power at reasonable rates and in amount equal to its needs, but in excess of the average amount used by it annually during the previous 10 years."

Now, as I understand it, that is a perpetual feature of the lease. I did not so construe it at first, but I cannot put any other construction on it.

I repeat that if Mr. Ford could be here to attend to this it would be one proposition, but with this great drive being made by financial interests to control all our resources it is different. Mr. Silver read into the record the other day a list of those financial interests. There are four or five pages of them and I can not give you the full list now. There are a number of big banking interests who are trying to get hold of the natural resources, quoted as opposed to this bill. There are two kinds of opposition. If I were a business man wanting to get a natural resource, I would want this principal established absolutely, which is incorporated in Mr. Ford's proposal, or, may I say, in the proposal which I believe the Farm Bureau Federation made to Mr. Ford. I have no legal evidence of that, but I know past records.

Now, as to what is going to happen in the fertilizer line, here is the joker which entitles it—

Senator KENDRICK. Before you leave that, Mr. Marsh—

Mr. MARSH. Yes, sir.

Senator KENDRICK. I want to ask you this question: Are you in favor of a longer period of lease than 50 years?

Mr. MARSH. Absolutely opposed to it. That is the maximum.

The CHAIRMAN. Your contention is that when this lease expires in a 100 years it will still be the right of that company to get the electricity generated by these dams, without limit as to time, equal to the amount of electricity that it had used on an average for 10 years just preceding the expiration.

Mr. MARSH. That is the only interpretation I can put on it, Mr. Chairman, because it says so specifically.

The CHAIRMAN. Of course, if that is a fact, it would probably be impossible for the Government to lease it to anybody else, because they could not get the electricity. Assuming that this company, during the last 10 years of the lease would use all of the electricity they have there, there would not be any to go to anybody else.

Senator HEFLIN. And I believe that Mr. Marsh is the only man who has put that construction on the offer of Mr. Ford.

Mr. MARSH. Well, in answer to that I will say that I do not want to be unfortunate in my construction, but I remember that when we were trying to get the packer-control legislation through about a year ago, we were working on a bill, a real bill, and the American Farm Bureau Federation drafted their bill—

Senator HEFLIN. Senator Kenyon's bill, are you speaking of?

Mr. MARSH. No; it was really the committee bill. Senator Norris worked on it. He was the chairman of the Senate committee, and conducted all of the hearings on it. He did yeoman work on it. The American Farm Bureau Federation put in a bill to control the packers, and one of the provisions was that no packer should be punished when convicted of a violation of any of the provisions of the act until guilty of a second offense.

Now, I was one of the representatives of the farm organizations who indicated that that was hardly a good way to protect the farmers and the consuming public, needless to say. That bill was introduced by Mr. Williams, of Illinois, and I do not blame him. However, I discussed it and I put my own interpretation on that bill. It was killed so dead that it could not be revived whatever effort were made to revive it. It is gone. May I add that it required no particular genius on my part to kill it. Mr. Silver said, "we did not intend to let that stay in"; but during the hearings I brought out that the packers had drafted that bill and they admitted it, although they first denied it, but I proved it on them.

Now, on the question of commercial fertilizer, this proposal says in section 14:

"The company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other commercial fertilizers (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum), throughout the lease period,

except as it may be prevented by strikes, accidents, fires or other causes beyond its control, and further agrees:

"(a) To determine by research whether by means of electric furnace methods and industrial chemistry there may be produced on a commercial scale fertilizer compounds of higher grade and at lower prices than fertilizer-using farmers have in the past been able to obtain, and to determine whether in a broad way the application of electricity and industrial chemistry may accomplish for the agricultural industry of the country what they have economically accomplished for other industries."

This is inserted in typewriting:

"* * * and if so found and determined, to reasonably employ such improved methods."

Now, they do not know, Ford does not know, no one knows, whether they are going to be able to manufacture fertilizer more cheaply, and we know that despite this, the American Farm Bureau Federation has the gall to say they are going to save the farmers \$150,000,000 a year on fertilizers. I want to say that that is the most conspicuous illustration of "effrontery" that I ever saw in all my life. Ford does not agree to do it. He does not even say that he is going to earn 8 per cent. [Reading:]

"(b) To maintain nitrate plant No. 2 in its present state of readiness or its equivalent, for immediate operation in the manufacture of materials necessary in time of war for the production of explosives."

I have been getting around to 30 States of the Union once or twice a year, and I am not worried over getting ready for any further war. I will say very frankly that another war would mean the abolition of the institution of private property, which would be a calamity from any viewpoint.

Senator HEFLIN. Don't you think, Mr. Marsh, that if Mr. Ford manufactures fertilizers at Muscle Shoals and charges only 8 per cent profit, that will reduce the price of fertilizers to the farmers?

Mr. MARSH. Well, I think that if Mr. Ford had full control it might, but there is something which was printed in there since the Farmers' National Council indorsed this proposal in principle which I would like to read.

The CHAIRMAN. The Farmers' National Council, Mr. Marsh?

Mr. MARSH. Has indorsed the proposal. This was written in since we indorsed the proposal—the principle, I mean. We did not indorse this whole plan. We thought it was a good thing to utilize this water power down there, but I will say right now that we do not think, knowing what is happening along the line of normalcy, that there was any chance of any Senators making a fight, such as Senator Norris to have the right sort of development of this water power by the Government.

Of course, we would now withdraw our support of Mr. Ford's proposal as it stands, because the council's preliminary plan is just what is planned for in your bill, Senator Norris.

Senator HEFLIN. Do you think there is any chance to pass a bill like Senator Norris has introduced here?

Mr. MARSH. I will say right now that I can tell you better on the morning after election. I think there is going to be an awful good chance, from what I hear all over the country; I think there is going to be an extraordinarily good chance.

Senator HEFLIN. Do you mean after the next election?

Mr. MARSH. The morning after the next election.

Senator HEFLIN. Do you think that they will vote on it before they go out on the 4th of March—most of them?

Mr. MARSH. I do not know. I do not belong to any political party, you see, and I can not tell what will happen; but I will say this: We have to look ahead two or three years. Suppose they do not do this for a year or so. I still maintain that with the present prices farmers are paying for fertilizers, and I am going to show how they are being saved by some honest farmers' organizations down South, if they buy it under present conditions for two years they will have very small cause to complain, compared with what will be the situation if you establish the principle of a 100-year lease, plus this provision in section 17, under which they get power in perpetuity.

I want the farmers to get cheaper fertilizer, and I am going to point out how I think it can be done.

I started to read section 15. Let me continue:

"In order that the farmers may be supplied with fertilizers at fair prices and without excessive profits, the company agrees that the maximum net profit which it shall make in the manufacture and sale of fertilizer products shall

not exceed 8 per cent of the fair actual annual cost of production thereof. In order that this provision may be carried out the company agrees to the creation of a board of not more than nine voting members, chosen as follows: The three leading representative farm organizations, national in fact, namely, the American Farm Bureau Federation, the National Grange, the Farmers' Educational and Cooperative Union of America, or their successors, shall each designate not more than seven candidates for said board. The President shall nominate for membership on this board not more than seven of these candidates, selected to give representation to each of the above-mentioned organizations, said nominations to be made subject to confirmation by the Senate, and there shall be two voting members of said board selected by the company."

Now, gentlemen, the American Farm Bureau Federation is chock full of bankers and business men and lawyers. I am a member of the grange. Probably 60 per cent of the members of the grange are farmers, or possibly 65 per cent.

The CHAIRMAN. Who are the balance?

Mr. MARSH. Little townspeople. I am not a farmer. I am a farmer's hired man.

Senator KENDRICK. Now, Mr. Marsh, do you think that that statement is correct?

Mr. MARSH. Yes. It is not true out West.

Senator KENDRICK. You must bear in mind that because a man is living in town and is a professional man, that that does not necessarily preclude the possibility of his being a real farmer.

Mr. MARSH. Well, I think you ought to limit the term "farmer," Senator Kendrick, to the man who is absolutely on the farm and doing work on it. I do not think you ought to include, by any means, the man who simply owns the farm and rents it out, because, as I figured out from the census figures and the reports of the Agricultural Department, the tenant farmers last year paid half a billion dollars more ground rent than they ought to. Out in Senator McKinley's own State, in Illinois, certain farmers would not rent their farms for less than \$25 an acre a year, as I was told by one of those farmers out there. Now, the men who own those farms are not farmers in that sense. They are not operating the farms. They are landlords.

Senator KENDRICK. If you will pardon me there, Mr. Marsh, I believe—

Mr. MARSH. Certainly.

Senator KENDRICK (continuing). I believe that it is quite possible that you are mixing the two questions. For instance, a man who lives in town and who finds it necessary oftentimes to stay there, does so against his will, or the man, even, who is in public service, may stay there against his will, when his inclination and his wish is to be back on his farm, and he is just as much a farmer as the man who lives right there and does the plowing.

Mr. MARSH. I believe, in fact I know, that the big fight in the farm field in the future is over the land question. Now, I have not been a farmer, although I have worked a great deal of my time in getting through college, in the summer, on the farms out in Iowa, of course, but I am pointing out that in this grange out West the members are pretty straight farmers, but in the East the membership of the grange is quite largely composed of those who are not actively working on the farms. Of course, somebody has to own the farms, that is unquestionably true, and landlords are entitled to a fair rental for them, but the tenant farmers to-day are in the most absolutely unspeakable distress throughout the Nation. They are organizing them mighty fast down in Texas. The farmers and the wage earners are effecting a combination in that State that will turn it upside down in two or three years.

Senator McKINLEY. I want to interrupt you there just to ask you whether you believe, excepting those persons who are here present, whether there is anyone in public service who is staying here against his will?

Mr. MARSH. I do not know. It is said in Holy Writ, "Whom the Lord loveth He chasteneth"; and I suppose the best way to chasten a man is to keep him here at Washington.

Senator KENDRICK. Well, I have an idea that the Senator had me in mind.

Senator McKINLEY. No; I excepted those present.

Senator KENDRICK. I know, but I have the impression that many men stay in town who, so far as they are personally inclined, would rather be on the farm. It may be that it pays them better to stay in town and it may be that they are spending the money that they make in town on the farm, but they

are just as much interested in the work of the farm and enjoy that feature and the attention necessary to give it more than anything they do. I think that is quite possible.

Mr. MARSH. I agree with you, but I have not gotten through with my statement. I did not mean to impugn the honesty of folks who rent out farms. That is perfectly legitimate. It has to be done when folks retire. They may have been bona fide farmers, but I am pointing out a fact which has been clearly established, that in these eastern States, particularly in New York and Massachusetts and the other New England States, about half or more of the members of the grange are young folks in the towns and little townspeople and shopkeepers. That point has been made, and I cite this constituency of the American Farm Bureau Federation to point out the consummate nerve of the Farm Bureau Federation who wrote this thing, excluding an organization which does not admit to membership anybody except the farmer, the National Nonpartisan League.

Now, I think there is a reason for it and I would be very suspicious of the seven men nominated by the American Farm Bureau Federation, which indorsed the Cummins-Esch law, which smashed agriculture, which fought the Norris farm products export corporation bill; which has stood for every big steal which robbed the farmers, and which opposed nearly every effort that was designed to help the farmers. I want to tell you right now that I would be suspicious of the seven men whom they would nominate.

Now, Mr. Silver said to some Senator, "Let him come and debate this." I spent three days at their convention in Indianapolis in December, 1920, on their invitation to speak and they were afraid to let me on the platform for those three days, although they have \$80,000 lawyers, and I can't talk.

Senator HEFLIN. Well, you are a pretty clever talker. Then, they are fooling lots of honest men who have appeared before this committee, if that is true.

Mr. MARSH. You mistake me, Senator. You have been good enough to put me in a class where I do not belong, and I will tell you how to get in it, and that is never to advocate anything that you do not believe in and are not sure it is right, and I guess both of us belong in the same class. I have talked to farmers by the thousands, and they have talked to me, all over this country, and we are suspicious of any organization which, like the American Farm Bureau Federation, has reported in the agricultural conference last January, received from the Chicago Board of Trade—that is, the hundred county farm bureaus, a thousand dollars apiece in cash. That is just four or five lines. May I read that, with your permission, because we would like to see what sort of men are going to be nominated to see that the farmers are protected.

This is the speech of Robert McDougal, of Illinois. They left out of here reference to the fact that he is the president of the Chicago Board of Trade:

"Attitude of the board of trade toward the farm bureau movement—The board of trade looks on the farm bureau movement as the greatest forward step taken by American agriculture in the last 40 years."

Yet you will notice that the farmers have all gone broke since it was organized.

He continues:

"The board of trade helped to start this movement and feels considerable pride in its rapid growth to power. The first farm bureau in the United States, Broome County, N. Y., recently celebrated its tenth birthday, and the speaker of the day pointed out how the financial cooperation of the Chicago Board of Trade with the agricultural and other local interests initiated this movement successfully and put it on its feet. In this way the crop improvement committee of the board of trade was a sort of grandfather to the farm bureau movement. A cash grant of a thousand dollars was made to each of the first 100 farm bureaus formed, beginning with the one in New York State and spreading to Iowa and other Middle Western States. The board of trade took no part in controlling the farm bureau, shaping its policies, or keeping any strings tied to it of any kind. I point with pleasure," asserts this president of the Chicago Board of Trade "to this farm bureau movement, not so much because of our financial investment in it, but because of the vision which was back of our activities."

Now, why stipulate that the American Farm Bureau Federation and the National Grange, both of which have indorsed the Cummins-Esch law, and both of which have opposed the Norris farm products export corporation bureau, which was the only thing which could have saved the farmers last year, should be allowed to nominate the people to decide what is an 8 per cent profit or what is a fair annual cost on fertilizer?

Senator McKINLEY. Mr. Marsh, may I ask you a question right there?

Mr. MARSH. Certainly.

Senator McKINLEY. Will the farmer or the business man buy fertilizer from Mr. Ford if he can buy it cheaper from somebody else?

Mr. MARSH. No; he probably will not. I doubt whether you could put enough propaganda across to carry that through, and if they do not buy a large supply, I doubt whether there would be a possibility of making 8 per cent, myself.

Senator McKINLEY. I think there is testimony before this committee that if we are going to compete with the Chilean nitrates and other fertilizers you must have power at three-fourths of a mill per horsepower hour, and the testimony of the Army engineers is that the cheapest rate at which power can be made is two and a half mills, or three times that cost per horsepower.

Senator KENDRICK. Does that mean secondary power, Senator?

Senator McKINLEY. I do not know, sir.

The CHAIRMAN. No, that does not mean secondary power. They have not put in any price on that.

Senator HEFLIN. It means primary power?

The CHAIRMAN. Yes.

Senator HEFLIN. You mean that that is the cheapest at which it can be produced now?

Senator McKINLEY. That is, the power.

Senator HEFLIN. Yes. They will probably be able to produce it cheaper than that at some time in the future.

Senator McKINLEY. I was wondering whether he was going to buy the fertilizer after it was made, or whether they would keep on making it and storing it up, if nobody bought it.

Senator HEFLIN. That is a pertinent inquiry, Mr. Chairman. I would like to hear the witness go into that a little.

The CHAIRMAN. That was not a question. The Senator was just wondering who was going to buy this fertilizer.

Mr. MARSH. The American Farm Bureau Federation is losing out in the Northwest; I mean the progressive farmers are getting out of it. They want to make a drive in the Southern States, and all of the farm organizations in existence that are really doing something for the farmers are opposed to them.

R. W. H. Stone is the president of the North Carolina Farmers' Union. They broke loose from the National Farmers' Union because they thought it was too conservative, and affiliated with the Farmers' National Council. The American Farm Bureau Federation is trying to get into that State, and the union is opposing it. In hearings before the House Committee on Banking and Currency a little over a year ago, Mr. Silver said he thought it was a legitimate aspiration for them to speak for all the farmers of America.

Now, to get down to the practical features of it: Mr. Stone is a practical man, and he told me he had saved the farmers of his State three or four million dollars in their fertilizer bill last year by going to a corporation and saying, in effect, "We will buy from just this one corporation, if you will give it to us at a reasonable price." Now, that was a practical proposition, and he did it. He is fighting the American Farm Bureau Federation, and he is doing that because he wants to help the farmers of that State. He is not getting \$15,000 a year, like Howard, or \$12,000 a year, like Silver, to be flunkies for Wall Street down here. That man is not getting a cent out of that farm organization in North Carolina. They can not afford it. The farmers are broke in that State, like they are all over the Nation.

Senator HEFLIN. Yes.

Mr. MARSH. Now, here is a thing that is inserted in typewriting, and I do not blame the typist for this:

"In order that such fertilizer products may be fairly distributed and economically purchased by farmers, the said board shall determine the equitable territorial distribution of the same, and may in its discretion make reasonable regulation for the sale of all or a portion of such products by the company to farmers, their agencies, or organization."

I do not know what that means. I do not believe Brother Ford read that. This was signed by Henry Ford on the 25th day of March, 1922, and this has been typewritten in that printed matter and has been inserted since the printed statement was prepared.

I might say in passing that I have sent to Mr. Ford the substance of what I have stated to you about the American Farm Bureau Federation and the Na-

tional Grange, because I make it a point never to say anything behind any man's back that I do not want to say publicly.

Senator HEFLIN. Mr. Marsh, do you object to stating the salary that you are getting?

Mr. MARSH. My total salary—I am managing director of the Farmers' National Council and I am executive secretary of the People's Reconstruction League—is \$300 a month. I do not get any salary from the council; I get it from the league, of which the council is a member and to which it contributes. I do not think that situation ought to continue, but, to be perfectly frank, I know the farmers are not in any position to pay big salaries to their representatives to-day. The average money income of the entire farm family for all of its work last year was only about \$100, and their taxes averaged \$150. I have seen desperate statements, and one man was in to see me the other day from down in Virginia, after that frost, and he said, "There are several of our fellows talking about committing suicide. They are wiped out; their whole crop is gone." Of course, I would not work permanently on the stipend of \$300 a month. They will not ask me to, but I mention that as you raised the point, Senator.

Senator HEFLIN. Yes.

Mr. MARSH. It is not germane to the principles of this proposition at all, but I am glad to answer it, because I had raised the other point.

Senator HEFLIN. Yes. You said what Mr. Silver was getting.

Mr. MARSH. But I will say this, that if they would pay \$20,000 to a man who would represent them and stand fast, it would be a good investment, but I point to their record.

Furthermore, here is this farm bureau that went into some business—the bureau which wants to nominate seven of the board of directors. They organized the United States Grain Growers (Inc.), and here is their financial report. They spent \$589,456. Their president, C. H. Gustafson, wrote me over his signature the other day that they had not sold a bushel of wheat, although they reported that that was spent to enable the farmers to sell their wheat, while the Farmers' Union in Nebraska sells 30,000,000 or 40,000,000 bushels a year. Up in the Northwest a cooperative wheat organization has sold about 20,000,000 or 25,000,000 bushels, and the Equity Cooperative Association has been selling a lot. These people squandered and wasted nearly \$600,000 of the farmers' hard-earned money without being a dollar's worth of good to them, and they come here and say, "We want to be directors of the organization to assure you that not over 8 per cent profit is made on the fair actual annual cost." I believe that is ridiculous. They have all of these economic schemes for saving the farmer, but they do not work. They remind me of the fellow out in Missouri who thought he could spit across the Missouri River and he couldn't spit across his own chin. That is true of some of these efforts to make over the whole farm field overnight. It can not be done.

The friendly feeling between Mr. Silver and myself personally was shown after I had exposed the packer control bill, when he said he was not a soap-box orator or an agitator.

Senator HEFLIN. Mr. Marsh, I understand that Mr. Silver testified before the Military Affairs Committee of the House that his salary was only \$7,500 a year.

Mr. MARSH. If I am doing him any injustice I will correct it; I will be glad to; it has been reduced very recently, then, if that is true.

Senator HEFLIN. You are trying to be as complimentary to him as you can; you are on friendly terms.

Mr. MARSH. Why, surely—on such friendly terms as those who are striving to serve the interests of the farmers ought to be.

Senator KEYES. Do you know anything about the salaries paid to other Farm Bureau officials in the States, for instance? Do you know what is paid in a State like Illinois; do you happen to know that?

Mr. MARSH. I think it is \$8,000 or \$10,000.

The CHAIRMAN. Do you know what the head of the Grange in Pennsylvania gets?

Mr. MARSH. John McSparron can not get over \$2,000 or \$2,500. It is too low a salary for a man of his ability and integrity.

Senator KEYES. I understood you to say that these men get about \$3,000.

Mr. MARSH. That is my recollection—eight or ten thousand dollars. I am not objecting to these fair salaries. I am objecting to what the folks do who draw them. It would be better to pension off a lot of these representatives of the farm organizations at \$20,000 than to let them draw the salaries which they do draw and pretend to speak for the farmers.

In passing let me instance this: America has reached the crisis which Europe reached a long time ago. All of our free land is gone. Now, that always makes a change in the economic life and in the industrial and agricultural life of a nation, when its free land is gone, and no superficial action is going to relieve agriculture. You have got to stop speculation in farm land; you have to stop speculation in transportation, which handles the farmers' products; and you must stop speculation in farmers' products and credit, and it is quite a job.

Senator McKINLEY. Mr. Marsh, I noticed the reply you gave to Senator Keyes about the salaries that these State officials are getting.

Mr. MARSH. That is not of importance. I instanced what I thought was the highest. Five or six thousand dollars is common.

Senator McKINLEY. You referred to Illinois. The head of the agricultural department in Illinois, the State department, only gets \$5,000 a year. Do I understand you to say that the president of the American Farm Bureau gets \$10,000 a year?

Mr. MARSH. Mr. Howard got \$15,000. He may have reduced it recently. Mr. Silver got \$12,000. He may have reduced it recently. If I have done him an injustice I apologize. I know they were trying to get him to reduce it, and if he has done it that is all right; but I am not raising any objection to farmers' representatives having a fair salary. Some of them are worth as much as Senators and Congressmen.

Senator McKINLEY. But we only get half of that amount.

Mr. MARSH. I know, but you are sure of your job for six years, and these fellows are not going to hang on more than six months longer, some of them. There is quite a difference, and they know it.

Senator McKINLEY. Well, that is true as to some of these Senators.

Mr. MARSH. I looked straight at Mr. McKinley, knowing what year he was elected in.

Now, here is what the Federal Trade Commission said on this fertilizer question, and I want to quote from the report of the Federal Trade Commission on the fertilizer industry to the President of the Senate, or to the Senate itself, in August, 1916. I tried to get their figures right up to date. I understand they are making a further study of this question, but they have not the data available to date. The principles are pretty well put, and I would like to put them forth. I do not mean to be bumptious about it, but I think the Trade Commission could give you in a very short time some information as to where the fertilizer situation could be most directly remedied, that is, through the existing organization of the Government departments, and the price of fertilizer, with the cooperation of the farm organizations, can be reduced.

The CHAIRMAN. Your statement reminds me that the Federal Trade Commission some time ago did make quite an exhaustive investigation of that fertilizer proposition.

Mr. MARSH. In 1916, they told me yesterday, was the last published report that they made. I realize it is just a little bit old, but I want to quote from it.

The CHAIRMAN. I think I introduced a resolution myself, and it was passed by the Senate, authorizing them to continue the investigation and bring it down to date. I do not know in regard to the fertilizer proposition.

Mr. MARSH. I know you did it on the profit of the millers.

The CHAIRMAN. Maybe that was it. I had in mind doing it in regard to the fertilizer; but perhaps I did it on the other, and not on this.

Mr. MARSH. I think it would be a favor to the farmers if you would put such a resolution in now, Senator, because we could get that information up to date, probably, in two or three months, and I think it would be very helpful.

Senator KENDRICK. Mr. Marsh, what is the name of the organization of which Mr. Gustafson is the head?

Mr. MARSH. It is the United States Grain Growers (Inc.). That is the outcome of the investigation made by the committee of 17 which was nominated by Mr. J. R. Howard as president of the American Farm Bureau Federation. There are very admirable members of that committee, and they made a very good report, unquestionably. The principle of commodity marketing is sound, Senator, absolutely sound; but, in our judgment, to scrap the State organizations, which are already doing good work, and to talk about a national organization and getting a million wheat farmers to agree to pool their wheat for five years was not a good thing for the farmers themselves.

Senator Ladd, I understand, who has been very helpful in organizing this United States Grain Growers (Inc.), like all others who have the farmers'

interests at heart, is very much perturbed over the bad financial showing which I have outlined to you, and I understand that he is having a careful investigation made, because his name was used as having indorsed the whole scheme. But the facts are there, gentlemen. Of course, I am old fashioned. I believe in starting on a small basis and working up.

Senator KENDRICK. It is your idea that the best results would be obtained through local organizations and probably eventually through amalgamation of those organizations?

Mr. MARSH. I think so, undoubtedly, Senator.

Senator KENDRICK. If it proves economical?

Mr. MARSH. If it proves economical; but of this fact I am absolutely confident, and I never reach conclusions by introspection; I have studied this question very carefully, I have talked with farmers and labor leaders and financiers almost all over the Nation, and I can not see any assurance this year of a fair price to the farmers for their products, by and large, except through legislation, such as the bill Senator Norris introduced last June. I think to create the Farm Products Export Corporation, and further action to stabilize the prices of farm products. I do not mean price fixing, necessarily. I believe that has to be done, the fixing of the price of farm products, but the alternative of this: The farmers can not get credit. The operation of the War Finance Corporation, as revived at the behest of Wall Street to defeat Senator Norris's Farm Products Export Corporation bill, has been an absolute failure. The minimum that the present Congress must do, I believe, is to create a Farm Products Export Corporation, similar to the plan devised by Senator Norris. Neither he who has pride of authorship, nor those who are indorsing it, are sticklers about the phraseology; but there must be a Government agency which will meet the pooled buying by foreign Governments of farm products, by giving to the farmers here the same sort of credit.

If you gentlemen will read the book "America and the Balance Sheet of Europe," by Bass and Moulton, you will see, as has been developed at Genoa in the last few days, that Europe is in a terrible condition and we are going down with her if we let agriculture go through the same experience that it we went through last year and the year before.

The CHAIRMAN. When you get to a good stopping place there, Mr. Marsh, I want to interrupt you, because I am satisfied that you want to be interrupted.

Mr. MARSH. Yes, sir.

The CHAIRMAN. Earlier in your testimony you referred to a particular clause in the original paragraph 17 of Ford's offer—as the offer is remodeled it is paragraph 18—by which, as you contended, the lease was, in effect, a permanent one. I did not have the Ford offer before me at that time, but I was under the impression, when you testified, that that had been changed, and I sent for it and have just received it. I agree with you that if the language was as it was originally, it would be permanent, but one of the modifications that have been made on the part of Mr. Ford is to eliminate that language. I have it here. The language that has been eliminated is as follows:

"If the said leases are not renewed or the property covered thereby is not sold to said company, its successors or assigns, any operation or disposal thereof shall not deprive the company, its successors or assigns, of the right to be supplied with electric power at reasonable rates and in amount equal to its needs, but not in excess of the average amount used by it annually during the previous 10 years."

That language has been stricken out.

Mr. MARSH. That language has been stricken out?

The CHAIRMAN. Yes.

Mr. MARSH. Well, I was not aware of that. I appreciate your calling my attention to it.

Senator HEFLIN. So it is not subject to the construction you put upon it?

Mr. MARSH. No; not in that respect, if that amendment has been made.

The CHAIRMAN. The copy that you have does not show that change?

Mr. MARSH. No.

The CHAIRMAN. It shows the other changes, but not that one.

Mr. MARSH. I thank you very much for calling my attention to it.

Senator McKINLEY. That limits it to a hundred years.

The CHAIRMAN. As it reads now, Mr. Marsh, it is like this:

"In order that said company may be supplied with electric power and the farmers with fertilizers after the termination of the said 100-year leases, should the United States elect not to operate said power plants, but determine to lease

or dispose of same, the company shall have the preferred right to negotiate with the United States for such lease or purchase and upon such terms as may then be prescribed by Congress."

Senator KEYES. Is that the revised proposal up to date?

The CHAIRMAN. Yes.

Senator KEYES. Up to the present time?

The CHAIRMAN. Yes. It still gives them a preferred right, and we have been arguing it all the way through on that theory. It still gives the company the preferred right, but it does not give them the right, in case the United States Government does lease it or sell it, to be supplied with power; but it gives them that preferred right in such a way that Congress may prescribe. That leaves it entirely up to Congress, as I understand the construction now.

Mr. MARSH. That correction emphasizes my query as to whether this proposal was made to Ford by the American Farm Bureau Federation or whether Mr. Ford made this proposal to the American Farm Bureau Federation—a matter which can be set at rest by a few questions.

Now, in this report of the Federal Trade Commission on the fertilizer industry, dated August 19, 1916, the following statement was made. I think they embodied things which we might consider, and I will try to be very brief in presenting it:

"The economic importance of the fertilizer industry, which embraces the production and sale of various fertilizer materials, as well as the manufacture and sale of prepared or mixed fertilizers, is shown by the fact that the value of all commercial fertilizers consumed in 1914 was in excess of \$150,000,000."

I understand the amount paid for fertilizers has about doubled. Needless to say we are opposed to a duty upon potash or upon any of the ingredients which enter into the manufacture of fertilizer unless there may be special circumstances which we do not know. You know the question came up during the war. Some concerns had invested a large amount of money and had very large expense and had fixed charges in an endeavor to develop the potash industry. In such a case, instead of having a tariff which would enable all the producers of potash to charge a price which they had to charge because of their war outlay I think it would be better to have Congress pay them something and not to have a general tariff on potash.

Senator HEFLIN. The farmers, as a rule, are against any tariff on fertilizers or fertilizer ingredients?

Mr. MARSH. I don't know of any exception to their opposition to that.

The CHAIRMAN. That applies particularly to potash?

Mr. MARSH. I think it would apply to all of them, Senator.

Senator HEFLIN. If you increase the price to them, they would oppose it, and certainly in the position they are in now there ought not to be any additional burdens put upon them.

The CHAIRMAN. I agree with that, but the point I make is—I may be wrong about it, and I would like to be corrected if I am, and maybe Mr. Marsh knows—what other ingredients used in commercial fertilizer besides potash and nitrates are imported?

Mr. MARSH. I don't know, Senator. I know those are the chief ingredients.

The CHAIRMAN. You don't know whether sulphate is imported or not, do you?

Major BURNS. Ordinarily there is none imported, but it depends upon the market. Last year we exported sulphate and did not import any at all.

The CHAIRMAN. Our import, then, so far as fertilizer is concerned, consists of the importation of nitrate and potash from Germany?

Major BURNS. Germany and France.

The CHAIRMAN. Yes; Germany and France.

Mr. MARSH. This continues:

"The following facts set forth by the report are of special public interest:

" FERTILIZER MATERIALS.

"1. The wholesale prices of nitrogenous and phosphatic fertilizer materials have been governed fundamentally by conditions of supply and demand during the period covered by the investigation, although artificial conditions have at times exerted at least a temporary influence.

"2. The wholesale prices of German potash salts have been arbitrarily controlled by a syndicate of producers of which the Prussian Government is a member, competition in prices having been eliminated since 1910 by an imperial law.

"3. Farmers' prices of fertilizer materials for cash purchases in carload quantities have compared favorably with wholesale prices, but farmers' credit prices have often been excessively high.

"MIXED FERTILIZERS.

"4. Most of the fertilizers used in this country are purchased in mixed form and not in the form of materials. In the mixed-fertilizer industry there are about 800 concerns operating some 1,200 plants, but the seven largest companies, with their numerous subsidiary and affiliated concerns control more than 58 per cent of the total output. The two largest sell annually over a million tons each, and in the aggregate about 34 per cent of the total output.

"5. The prices paid by farmers for mixed fertilizers have been high in comparison with the cash value of the constituent elements, partly because of credit conditions and the expensive distributing methods of the large fertilizer companies; for these reasons also the profits of the large companies have not been large.

"CREDIT CONDITIONS.

"6. Credit conditions affecting farmers are so burdensome that some action, legislative or otherwise, should be taken to remedy them."

This must sound familiar.

"Any action that would reduce the high interest rates on agricultural credits, particularly on short-time loans, would tend to reduce the farmers' prices both of fertilizer materials and mixed fertilizers.

"SELLING METHODS.

"7. Objectionable selling methods of some of the large mixed fertilizer manufacturers have been the unnecessary multiplication of brands and the operation of controlled companies as independents."

Now, I just outline their conclusions and call your attention, if I may again, to the fact that although there are 800 concerns, seven companies, with their subsidiaries control, roughly, three-fifths, or 58 per cent of the total output. This, of course, was in 1916. You have seven concerns there which really practically have a monopoly; that is, majority control.

Senator HEFLIN. That accounts for the fertilizer trust that we hear so much about?

Mr. MARSH. Yes; and two of them, the two largest, sell annually about 34 per cent of the total output.

These are figures for 1916. There may be some change, but I assume that the same ratio obtains.

The CHAIRMAN. What conclusion did the Federal Trade Commission, on that investigation, reach as to whether there was a wrongful and illegal control of the price of fertilizers?

Mr. MARSH. Senator, it has been years since I have read this, and I have not had time to go through this. I will be glad to summarize it. But may I suggest this, that conditions have changed somewhat, and the Federal Trade Commission must have some expert who could give you a good deal of information, even before they make this further inquiry, and could answer accurately your question.

The CHAIRMAN. I think we ought to send for them, probably.

Mr. MARSH. I don't like to give an opinion. It is only recollection. I simply quote it. I know that they can give it to you.

May I say this? I think that one of the great services which the Federal Trade Commission—which some special interests want to kill—can render in the future, as it has in the past, is in just giving information like this. I don't want a farmer paying \$10 a year dues to a farm organization to investigate this fertilizer situation when we have the most efficient investigating agency right here in the Federal Trade Commission, and I know they would be glad to do it and they will give you that information.

Senator HEFLIN. You say that some of these special interests have been trying to kill off the Federal Trade Commission?

Mr. MARSH. Yes, sir. The United States Chamber of Commerce has made up their minds to kill the Federal Trade Commission, but I wrote the President in effect that the party which abolished the Federal Trade Commission would abolish itself, and I think that is perfectly true. It has the entire and unquestioned confidence and respect of an overwhelming majority of the people throughout the United States, of the producers of wealth. I think that no legitimate business man objects to it. They have made their mistakes—the

commission. A lot of these business concerns would be haled into court if it was not for the Federal Trade Commission, whose method, in my judgment, is the much more effective way of handling such a situation. It is a little like this: We have the antitrust laws, and they don't know just where they are, a lot of these business interests and manufacturers. It is expensive litigation to come into court, but to be asked to answer a complaint, and, without counsel, just lay your case before a commission like the Federal Trade Commission and try to get straightened out, it seems to me is a great boon to the honest business man who may have inadvertently made some mistake in his transactions.

Senator HEFLIN. Go your way and sin no more.

Mr. MARSH. Precisely. It is only the companies who want to sin some more that we are after now.

Now, in conclusion, of course I believe we ought to recover about \$2,000,000,000 that was stolen from the Government during the war, but I don't believe they would go to jail, the fellows who stole it, and they won't.

The CHAIRMAN. You are very tender-hearted.

Mr. MARSH. Oh, no. I recognize facts. For a year now we have been trying to get the President to make the Attorney General of the United States investigate the several hundred million dollars a year which the railroads have been robbing the people of, and after I asked the President to do that, to tell the Attorney General to investigate them, what did the President—or some one else—do but have the Attorney General investigate me last summer, and I told that Ohio politician who they told me in his State could not be elected dog catcher on a bet, if he would stop wasting the taxpayers' money and investigate the lumber interests, and investigate the meat packers and all these other trusts, he would be entitled to keep on his job, otherwise he was not. But, of course, we know politics is politics, and I don't understand politics at all.

Senator HEFLIN. I recall four lines of poetry that are very appropriate:

Law imprisons man or woman
Who steals a goose from off the common;
But lets the greater culprit loose
Who steals the common from the goose.

Mr. MARSH. I wonder if that could be inscribed and sent to the Attorney General?

Now, the real issue, gentlemen of the committee, it seems to me, is this: The disposition of the natural resources of the Nation, which are worth literally billions of dollars. The Farmers' National Council is regarded as a radical organization. It is not. Our program is not as radical as that of the farmers' organizations in Canada, which have captured the Government. We believe that anything which in order to be run economically and efficiently must be conducted as a monopoly should be owned and operated by the Government. That applies to water power. It applies to the railroads. It applies, at least as to ownerships to the ships. It applies to the coal industry.

Therefore we hope that you will enact legislation to enable the Federal Government to retain the plants which we have constructed down in this Muscle Shoals project, to retain full title absolutely to the water powers of those navigable streams, and to any which may be developed, and that it may be developed as an object lesson of what can be done. I trust that before you get through you can get Sir Adam Beck, who is chairman of the Hydroelectric Power Commission of the Province of Ontario, to appear before you and tell you what they are doing.

The CHAIRMAN. Now, Mr. Marsh, that interests me. Sir Adam Beck is not in this country now, is he?

Mr. MARSH. No, I think not.

The CHAIRMAN. Are you familiar with the report made by an American engineer named Murray, selected by some American corporations, some association, I think, electrical association, or something, anyway some American business men or corporations, to make an examination of the price that the consumer had to pay under Sir Adam Beck's corporation over there in Canada, and what the consumers of America have to pay?

Mr. MARSH. I know of that report, but I am not familiar with it, Senator Norris; but I know that all these big corporations maintain what they call their statistical bureaus, just like the Bureau of Railway Economics, which is maintained by the railroads.

The CHAIRMAN. I have a copy of his report. Mr. Murray reaches the conclusion that this Government-owned system over there in Canada supplies to the consumer electricity at a higher price than the privately owned electric

establishment supplies it to the American people. What do you think about that?

Mr. MARSH. Well, I know that charge is always made, but I happened to be the other day out in your State talking to Mr. R. B. Howell, who is the head of the Omaha, Nebr., electric light plant, and—

The CHAIRMAN (interposing). Water works.

Mr. MARSH. And gas plant. He told me how they put forward the same statement, that the municipality of Omaha was paying more than other localities, and then he told me how they forced the price down all along the line. I think the only answer to that question is to have Sir Adam Beck analyze Mr. Murray's report.

The CHAIRMAN. I have thought ever since I read it two or three weeks ago that I would write to this company over there. I was not satisfied from the slight examination I made of Mr. Murray's report that it was correct at all. It seemed to me all the way through he was making an argument to demonstrate what it looked as though he might have been employed to prove. I don't know.

Senator NORBECK. Mr. Chairman, may I say here that the South Dakota Hydroelectric Commission, of which I was a member for a time, had two of their members in the Province of Ontario for a considerable length of time investigating, and they came back greatly impressed with the work that Sir Adam Beck had done up there. In fact, they were well pleased with it all the way through. There was just one problem that they felt was unsolved, and that was this: Possibly he had undertaken so much and gone so far with it that it was difficult or nearly impossible to find a successor for him when he quit. But that was the only thing. They reported that it was a real success all the way through.

Mr. MARSH. I had a friend who worked for a short time for one of those concerns until she was told how to doctor up her returns to be prejudicial to public ownership, and, like an honest person, she threw up the job.

It is, of course, a question of the greatest importance to the people.

In connection with your bill, Senator Norris, I can not attempt to analyze it, because it is a big question which I do not know about in detail. I do know this, that if we in this country have ability enough to win a war to make the world safe for democracy we must have ability enough to make it a decent place to live in after we have won the war. We have not done it yet. We have got to reduce the cost of living.

Seeing Senator Norbeck reminds me of the fact that South Dakota went over and bought a coal mine in North Dakota, and the State of South Dakota is operating it, as I remember. Am I correct?

Senator NORBECK. Yes.

Mr. MARSH. And they do not call you Socialists out there?

Senator NORBECK. Oh, yes; they call me worse things than that.

Mr. MARSH. You also own a State cement plant, do you not?

Senator NORBECK. I don't know as to that.

If you want my opinion on that subject, I want to say that I believe the Government should do a great many more things than it does, but I believe there are some very sharp limitations beyond which it is not practical for them to go; and I do not think our remedy lies in general Government ownership and management, because I think it would be a farce if carried to an extreme.

Mr. MARSH. May I state, if I am not detaining you too long, the position of the Farmers' National Council is this:

If a thing, in order to be efficiently and economically operated, must be a monopoly, such as the coal industry, or transportation, or the ships, or the water power, as brought out in testimony given by Doctor Van Hise, then the Government should own and probably operate, but certainly own them; but when it comes to private business like farming and manufacturing, with few exceptions, we say hands off by the Government. But the thing that has got to be used by everybody—

The CHAIRMAN. As I understand it, your position can be well stated in a general way by saying where it is necessary or desirable for the purpose of efficiency and economy that there should be a monopoly, you want the Government to either own that monopoly or have very complete control over it.

Mr. MARSH. Absolutely. I think that Dr. Van Hise put it admirably in the brief quotation I gave from his book this morning on the conservation of natural resources. I suppose he would go a little further than he did at that time on 'em, but he came ahead quite a little. That was written in 1912.

Senator NORBECK. We have come ahead quite a little since 1912, as public opinion has developed and as the public is prepared to adopt new ideas. When we reach the ideal state we can have socialism. When we can have people who would just as soon work for their neighbors as for themselves, we won't have any more trouble.

Our State has gone further along those lines than any State in the Union, but we have not gone ahead with anything that has fallen down. We have gone ahead with practical business methods. Our State farm loan does business on a much larger scale than the Government itself.

Mr. MARSH. About \$40,000,000 you had?

Senator NORBECK. About 40, when the other fellow put in 5 or 6. We have State insurance that saved our people \$4,000,000 and carries more than \$1,000,000 surplus in the treasury, and we have State coal business that has not done big things, but it has reduced the price \$1 a ton, and that makes the people mad. Nevertheless I am convinced that the State can not enter into anything except where you have a material advantage, and I don't believe you can take and run these railroads without greatly increasing the cost of the carrying charge.

I think Senator McKinley visited Panama and knows something about the Government-owned railroad there. The Government owns the railroads in Alaska, and we are appropriating over a million and a half to take care of its expenses. The cost per mile is way out of sight, and the Government has to pay the bill.

The CHAIRMAN. I don't know that we ought to take up our time and fill up the record with the Government-ownership proposition.

Senator NORBECK. I guess you are right.

The CHAIRMAN. But, with reference to that Alaskan situation, in actual experience private parties make failures like that, you know. Anyone is liable to make a failure, whether it be the Government or private individuals.

The operation of the Panama Railway and the ships that have been operated is by a Government corporation, just the same as any other corporation, except that the Government owns all the stock. That is the only difference. That has been conceded, as I understand it, to have been a success from the very beginning.

Senator NORBECK. Just like the Government during the war. They have more men standing around on the pay roll than they have room for.

The CHAIRMAN. But still the operation is a success. We so often forget a lot of those things that can be said truthfully against the Government operation of railroads can be said likewise against private operation. The same applies to privately owned operation. But there are some things which can be said against private operation which can not be said against Government operation. For instance, watered stock. That has no place in Government ownership.

But let us go on with the discussion of the bill.

Mr. MARSH. If I may make this statement—because I don't want to be understood as acquiescing in the judgment of Senator Norbeck as to Government and private operation of railroads—I just make the one statement: I stated that, in my opinion, Mr. McAdoo is correct in saying that Government operation per unit was approximately one-third cheaper than private operation. That is my impression. I think Mr. McAdoo proved the case.

Senator NORBECK. I wish you would help us make up the money to pay the losses.

Mr. MARSH. The fellows who were running the railroads had made up their minds, Senator Norbeck, that they were going to kill any possibility of Government ownership by sabotaging Government operation. I have learned myself from employees of the railroads how they were instructed by the men higher up to waste things and to ruin the service.

Senator MCKINLEY. Is this all going into the record? It has no relation to Muscle Shoals.

The CHAIRMAN. It is not, I guess, at all pertinent to what we are considering here and we might just let the Government-ownership testimony be all stricken out.

Senator HEFLIN. We have let a whole lot go in and we might as well let that stay in that has already gone in.

The CHAIRMAN. I have no objection to it.

Mr. MARSH. I would make one suggestion in the way of detail and that is whether, in developing this Government water-power plant to generate electricity and possibly to manufacture fertilizers it would be wise to adopt the policy, which, evidently, Canada has adopted, Mr. Chairman, and instead of providing for a board of directors of three, have one executive, like Sir Adam

Beck, up in Canada, who has had charge of the Ontario Hydroelectric Power Commission, and then to have your board of directors to supervise, but just to have one executive who will be responsible for the entire management. That does not affect any of the provisions of the bill except that.

Senator NORBECK. Then contract with the Lord to have him furnish some more Sir Adam Becks. Then we will be all right.

The CHAIRMAN. If they will let me pick them I can get a Sir Adam Beck and get one every day in the week.

Mr. MARSH. I think probably the way the Lord will answer that prayer will be to have us experiment a little, because you can not develop those men overnight. But, as Senator Norris has said, there are such men, who are to-day serving big corporations, who would love to serve the public in that way. I think that is what you had in mind—they would much rather serve the public than serve a corporation. I hope that this matter will be pressed immediately. The question is raised whether you could get public sentiment behind it. I don't know. Certainly you should. When I get out and talk the newspapers give me a lot of publicity, and I am going to be in about 17 or 18 States in a couple of weeks—as I am leaving for the coast. I hope that the proposition will be pressed. There are some changes, doubtless, that you will want to make in the phraseology of this bill but the fundamental principles are absolutely right.

The Government has invested a large sum of money. Whether it was wasted or not is not germane here at this time, because it was done under the stress of war. It should retain the plant which it has constructed. I understand they are deteriorating very rapidly, and naturally so. Four years or so have elapsed since the armistice. I think you will get very wide support for this bill, Mr. Chairman. I am sure that the American Farm Bureau Federation should be more than delighted to revert to their original position on the matter and show that they were in earnest when they indorsed it before, and I know you will have the backing of most of the large farm organizations. I call your attention to the fact that the American Federation of Labor has come out last year much more strongly than ever before in favor of the Government retaining these natural resources and developing them for the benefit of the entire public, and not for any stockholders.

If I can help you any in getting this through, I am going to mention it in my talks this summer and hope we can get it by, because it is a practical proposition; but rather than let the farmers get their fertilizers for \$10,000,000 to \$25,000,000 a year cheaper, if you please, and pay \$100,000,000 a year extra to monopolizers of natural resources, I would withdraw that offer of Mr. Ford's; I would not accept the offer of Mr. Ford, but go ahead with this Government-operation plan, and then you might possibly get Mr. Ford to run that thing. That is my suggestion.

Senator HEFLIN. If Mr. Ford should take this Muscle Shoals project for a shorter period of time, would you favor letting him have it?

Mr. MARSH. I will put it this way: I would consider very carefully Mr. Ford as the executive to administer that for the Government.

Senator KENDRICK. Would not you be perfectly agreeable to a plan under which the Government retains every right to the property, but leases it to Mr. Ford for a reasonable number of years—say 50 years—and that Mr. Ford in his agreement with the Government meets their requirements in a businesslike way, so that there would never be at any time an entire divorce on the part of the Government from control of the natural resource there?

Mr. MARSH. No, Senator Kendrick; for this reason: The issue is much more important than Ford. The issue is whether our natural resources are to be devoted to the American people.

Senator KENDRICK. I understand. Let me interrupt you there. My idea is that we are supposed in the handling of these Government resources, first, to not alienate the title. That is the first thing, and I think the most important. The next thing is to handle it in a businesslike way. Now, if we can do it through this method, that would be the way we would do it if we owned it privately and we were interested in getting the best results from it. It seems to me it might as well go to Mr. Ford as to any other individual, provided it can be done in a sensible and satisfactory way.

Senator MCKINLEY. In other words, Senator Kendrick, you mean rather under the control of the Federal Power Commission?

Senator KENDRICK. Yes; something on that order. The two points, Senator McKinley, are that under no circumstances would I want to alienate this title, even to give him a lease for a hundred years.

Senator McKINLEY. But the Federal Power Commission would retain control?

Senator KENDRICK. Your children and my children might want to and might find it necessary to act in an entirely different way in 50 years from the day this lease is made, and they ought to have the right to do so, if they wanted to change it.

Mr. MARSH. Senator McKinley, answering your question, in Mr. Ford's offer first he is going in to develop this to get power to manufacture automobiles or other things and to make all the money on them. He proposes to get this natural resource at very low terms, and he is going to make money out of it, and I don't believe that any individual, however good, is entitled to make money out of a natural resource. Therefore, if we accept this offer of Mr. Ford's, you give acceptance to the principle, which you will have hard work in denying to others who come later.

Senator KENDRICK. Mr. Marsh, I take it from your statement—as the chairman has pointed out, I do not know that it is at all pertinent, but we are discussing the best method to handle this proposition, and now following up the reason that you have advanced, the Government must necessarily, if it is unwilling for any corporation to make money out of this power, handle it all itself, control the whole situation and control the industry. After all it becomes an industrial proposition, to see that the power is properly used under the supervision of the Government to prevent unfair dealing and unfair control in the way of monopoly, under the supervision of the Government. It seems to me that our system of government has developed the fact that it is more economical to do it through individual and corporate efforts rather than through the Government.

Mr. MARSH. Well, I can only give you the opinion of our people, and I read first the actual position taken by the Farmers' National Council on the question of natural resources. We believe that the Government should develop this water power. We do not believe that it should give a lease for over 25 years. That would be the last alternative. We believe it should control this water power, should sell the product practically at cost, plus, of course, an allowance for depreciation and amortization and everything of that sort, and all fixed charges; but we do not believe that Henry Ford should be permitted, or anybody else, to get this water power and to use it to reduce the cost of manufacturing automobiles or anything else, and then retain to himself the advantages of the reduced cost, which he would do, and which he would be entitled to do; but that motive power should be made available to anyone on equal terms, by which I do not mean a man who would use 10 kilowatts would pay the same as the man who used 100,000, but for equal service equal payments should be made, and I repeat, when the question of monopolies is involved, we have reached the parting of the way in our Nation, and we might as well confess it. I have in my pocket a list of some of the American multimillionaires.

The Rockefeller family is worth from three billions to five billions; the Pratt family from three hundred million to four hundred million; Harkness four hundred million, and there is this long list. How did they get it? By control of natural resources, including transportation and pipe line as in the case of the Standard Oil. We have got to stop that. More than that, we have got to take back by taxation, through an inheritance tax, from fifty to seventy per cent of these fortunes. Why should we continue a system which has built up these dangerously large fortunes? I would just as soon trust Ford with a big fortune as anybody else, but the point is it is not a sound proposition. We want to reduce the price of things, and we have got to reduce the cost of producing those things, and the motive power is a big factor. This does not apply alone to this one State of Alabama or this one project; it applies throughout the Nation, where they are trying to grab everything.

When I was out in California last fall I saw Mr. William Kent, who told me he was going into a big fight for the State to expend \$500,000,000 in developing water in that State and Rudolph Spreckles and the labor organizations and progressive farm organizations are in for that fight. I think it would be a blow to every such undertaking, and this is only one of several, if we should alienate or turn over to private individuals this proposition down at Muscle Shoals, but I can say that, because everyone knows when we say that, that it is not a question of Mr. Ford as an individual. It is not a personal matter. It is solely a principle, because you would trust him and I would trust him with anything, personally.

Senator KENDRICK. I understand that while it is not personal so far as Ford is concerned—and it is not so with any of the members of the committee—but

following out your argument, it seems to me you would involve the Government in every kind of manufacturing enterprise in order to handle that power.

Mr. MARSH. No, Senator. I did not make that clear. I draw the line distinctly and very clearly. There is the waterpower given by God. To make it valuable there has to be some investment in plant. That investment should be made by the Government; that is, collectively for the people. The product should be sold; that is, the power should be sold at equal rates to all and on equal terms to all. There the Government responsibility ends, as far as this corporation is concerned, the Government's responsibility ends, but, as I said earlier, suppose we develop the power and we sell electric power for commercial purposes to a boot manufacturer. This commission which develops Muscle Shoals probably ought not to have anything to do with the price of shoes, but some other commission. That would be too big a proposition for one. But the Government has got to say, "Now, this water must be used to reduce the cost of living, which would mean the Government retaining it and not Ford or anybody else making a profit on the development of this water-power proposition."

Senator KENDRICK. I think I get your idea clearly now. Your idea is for the Government to complete the dam and for the Government itself to sell the power to anyone who wants it, but not all to any one person.

Mr. MARSH. No; that as far as possible it should be distributed so as to encourage small concerns, manufacturing and others, and not to give a special advantage to any big concern.

Senator KENDRICK. Then is it your idea that the Government's responsibility, so far as the price fixing of the products manufactured is concerned, ends with the sale of the power? That is your idea, is it?

Mr. MARSH. As far as this branch of the Government responsibility is concerned, it ends there, yes; but then if we give the Federal Trade Commission power to require business concerns in the United States to take out an elective license, to which I referred, which is provided in the Steele bill now pending in the House; but that is another proposal. We are sticking now to this question, How shall the motive power developed by the Nation's water power be used to the advantage of the public? Certainly one way is by making an experiment down here at Muscle Shoals, keeping the cost down all we can. You ought not to charge to the cost of production any of the cost that was due to unusual war conditions.

Senator KENDRICK. Just right there, I want to ask you one question: Would you be agreeable for the Government to operate this, to own and operate it—that is, the power plant—and to conduct the fertilizer plant under the supervision of this commission provided and to sell the balance of the power to the highest bidder?

Mr. MARSH. I think the principle of that would be the right thing.

Senator MCKINLEY. In a few words, you urge Senator Norris's plan?

Mr. MARSH. Yes sir, just as I did before.

Senator HEFLIN. You are opposing Ford's offer now?

Mr. MARSH. I am opposing Ford's offer, but I will tell you I am not opposing it just for political purposes, but I believe it is a case where the Government should go right into the proposition and run it, and I doubt if Henry Ford, a man of 60, could give the attention he has got to give to his own automobile business and this proposition. I don't think of a better way for Henry Ford to round out his career of beautiful service than to go and make a success of a proposition like this for the Government.

Senator HEFLIN. He says he will make a success of it and he will sell fertilizer to the farmers at half the cost they pay now.

Mr. MARSH. No, Senator; I don't think he says that. That statement is made by the Farm Bureau Federation, who have got to throw out a bluff to keep any of its members.

Senator HEFLIN. He has not stated it here himself, but his friends, who know him well, and who have talked to him, tell me that he will make fertilizer and sell it for half what they are paying to-day. Would not that be a great blessing to the farmers of the country?

Mr. MARSH. It would be a great blessing to the farmers of the country. Let me get this correctly. It would be a great blessing to the farmers of the country to get their fertilized at half price, but even getting fertilizer at half price would be a penalty too much for the farmers to pay if as the price therefor you are going to permit a continuance of the present system of private exploitation of natural resources.

The CHAIRMAN. Don't take that too seriously, Mr. Marsh, because Senator Heflin's question is founded on two or three things. He says his friends told him that some friend had told him that Ford had told that fellow that he could make fertilizer at half cost. Now, if that is true that is a good thing.

Senator HEFLIN. Now, Mr. Mayo, the representative of Mr. Ford, said that here.

The CHAIRMAN. There is some doubt about it being true, and some doubt even about Ford ever having said that.

Senator HEFLIN. That is what Mr. Mayo said, that he could make it at half the price. All of his friends outside who have talked to me about it tell me that he will do that, and also he says he will use 500,000 horsepower and get it out of that river.

Mr. MARSH. What is he going to pay for it?

Senator HEFLIN. Pay something that is reasonable. But here is the situation we are up against it, Mr. Marsh, using this project down there to accomplish something, or letting it lie there and never be developed. Now, it has been lying idle ever since the Government quit work on it, and not until Mr. Ford made his offer to take it up and carry it on and complete it and use it did anybody else come in and offer to do anything with it at all. Now, then, don't you believe that the fertilizer trust and other powerful concerns are doing their best to defeat Ford in the offer that he makes?

Mr. MARSH. It may be they are, and that is not involved in the question at all. They would be just as bitterly opposed and they were just as bitterly opposed to the Government doing anything.

Senator HEFLIN. Certainly. Now, won't they oppose Senator Norris's bill just like they have opposed Ford's offer?

Mr. MARSH. Unquestionably they will.

Senator HEFLIN. Is it not their purpose to defeat any step on the part of the Government or private enterprise to complete that dam?

The CHAIRMAN. Will you just permit me to suggest I wish you would make the same kind of argument for my bill, as we call it, as you do for Ford. You say we can not get this so-called Norris bill because these special interests will fight it, and then you say we have got to have the Ford offer because the special interests are fighting it.

Senator HEFLIN. Well—

The CHAIRMAN. If they can defeat my bill then they can defeat Ford's.

Senator HEFLIN. I am hoping the House will pass the Ford bill or offer, which I understand they will, and if the House goes on record for it, then that is the best thing in sight for the Senate to do, to accept the Ford offer, because then we will get something out of Muscle Shoals; but if we pass something else and the House has gone on record for another proposition, then there you are deadlocked.

The CHAIRMAN. You are for the Ford offer because the special interests are against it, and you are against my bill because the special interests are against it.

Senator HEFLIN. Oh, no.

The CHAIRMAN. The special interests objection works one way with you on one thing and another way on another thing.

Senator HEFLIN. I am for the Ford offer because I believe it is the most feasible thing. I believe we can come nearer getting it than we can anything else.

The CHAIRMAN. It is because they don't oppose it quite so hard, then, as they do mine.

Mr. MARSH. Senator Heflin, you have asked several questions and I want to answer them very specifically.

In the first place I regard the men in charge of the American Farm Bureau Federation and the National Grange as absolutely dishonest and betraying the farmers of America. If this be criminal libel I ought to be in jail, for I have said this in about 18 States, and proved it.

I am, therefore, absolutely opposed to permitting men nominated by these organizations which have indorsed, one or both of them, most of the big steals such as the Cummins-Esch law, which has crushed agriculture, and which have opposed all practical methods such as the Norris Farm Products Export Corporation bill, to help farmers from having any control over such a plant.

Senator, are the Democrats willing to permit a Republican administration to establish the principle of Government ownership and development of the water power of the Nation or are the Democrats using Mr. Henry Ford in this matter for political purposes as a possible presidential candidate in 1924? In other

words, will the Democrats—recognizing, as I do, that the Republican administration in full control is responsible and ought not to play at politics—establish the principle of the 100-year lease, or back up the plan to have the natural resource of the country developed for the people's benefit?

Senator HEFLIN. Those are questions that are rambling through your mind?

Mr. MARSH. They are rather rampant over the country. Of course, the Republicans have got to take all the responsibility for what happens under this administration, but at the same time here is a vital issue on which the Democrats are going to have a vote, and I want to make this clear, not in connection with the council, but I am also a member of this Conference for Aggressive Political Action. We are going to back Republicans and Democrats. We do not know the name "Republican" or "Democrat" for the United States Senate, for Congress, or for President, or anything else. But here is a great issue. Are we going to embark upon a policy of alienating control of our natural resources for a period of a century?

Senator HEFLIN. Well, now, I have never even heard Mr. Ford discussed amongst Democrats as a possible candidate for the Presidency. That is news to me, that you suggest here that we are trying to use Mr. Ford as a candidate. The Democrats that I know anything about and who favor the development of Muscle Shoals are doing it purely because they think it ought to be developed. It is a great power site, and it is obstructing navigation as the dam now stands, and there is power going to waste there, thousands and thousands of horsepower. The farmers of the country, whom you claim to represent in part, are absolutely at the mercy of the Fertilizer Trust. They have no way whatever to control the price they will pay for the fertilizer that they have to buy. We are trying to relieve those people from the clutches of the Fertilizer Trust: trying to lift some of the burdens off of their backs.

Mr. Mayo, who represents Mr. Ford, testified here that Mr. Ford thought he could, or intended to manufacture fertilizers and sell them to the farmer at half the price he is paying to-day. Now, then, you are willing to put your opposition against Mr. Ford, although the House may accept his offer, and it looks like the most promising proposition in sight—you are willing to put your opposition against his offer and support something else that is contrary to the position the House takes, and throw the two bills in conflict and further postpone and delay development of Muscle Shoals.

Mr. MARSH. You put it in that way. What I would do is this. I would never sacrifice dollars to be able to invite pennies. I am old-fashioned, I admit. I am never fooled by any gold brick. I know what the basis of the great fortunes of America is—control of our natural resources.

I will make this statement: If the Senate and Congress of the United States wants, it has the power, and it can reduce the price of fertilizer to the farmers 15 per cent to 25 per cent in a very short time, with the cooperation of honest leaders of farm organizations, like R. W. H. Stone, president of the North Carolina Farmers' Union. If these fertilizer men are profiteering—and some of them are—the Attorney General is not doing his duty if he does not stop it.

Second, it is pretty clear that nothing definite will be done with reference to cheaper fertilizers for the farmers under the Ford proposal for anywhere from 1 or 2 or 10 years, whereas before this Congress adjourns you can make the Attorney General prosecute this present fertilizer combination or trust, as they are called, and reduce the prices down to a fair figure. Now, that should be done immediately. But as to establishing the principle of letting a good man do a bad thing for a hundred years, our crowd won't stand for it.

Senator HEFLIN. You would rather let the dam stand as it is and the whole project lie idle for 100 years than to permit anybody to use them for 100 years and do good with them?

Mr. MARSH. It won't stand idle for 100 years. You are stating a hypothetical proposition now absolutely.

It won't do it. The American people are waking up. In 10 years there is going to be a different Congress here, and they are going to put some of these things across.

Senator HEFLIN. Yes.

Mr. MARSH. Yes; and I doubt if there will be any material delay if you do not pass this Ford plan at this time.

The CHAIRMAN. We will adjourn until 10.30 to-morrow morning.

(Whereupon at 12.45 o'clock p. m. the hearing was adjourned to 10.30 o'clock a. m., Friday, May 12, 1922.)

MUSCLE SHOALS.

FRIDAY, MAY 12, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m. in the hearing room of the Committee on Commerce, Capitol Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), Ladd, Norbeck, McKinley, Harrison, and Heflin.

The CHAIRMAN. Gentlemen, the committee will come to order and we will proceed with Mr. Swann.

STATEMENT OF MR. THEODORE SWANN, PRESIDENT OF THE FEDERAL PHOSPHORUS CO., ANNISTON, ALA.

The CHAIRMAN. Mr. Swann, will you please give your name, age, occupation, etc., to the reporter?

Mr. SWANN. Theodore Swann, president of the Federal Phosphorus Co., Birmingham, Ala., manufacturer; 35 years of age.

The CHAIRMAN. You are the youngest expert the committee has had before it, Mr. Swann, and you ought to be the most modern.

Mr. SWANN. I have been in business 31 years.

The CHAIRMAN. Ever since you were 5 years old?

Mr. SWANN. Ever since I was 4 years old; yes.

The CHAIRMAN. You know what we are considering, Mr. Swann, and I would like to have you go on and, in your own way, give us all the information you can.

Mr. SWANN. The present method of manufacturing fertilizer, as is true of many other things, will have to be revised from time to time in order to reduce the cost. You have been considering at Muscle Shoals the question of ammonia, one of the three elements that goes into the manufacture of fertilizer.

We have developed at Anniston, Ala., after more than three years experiments, the commercial production of phosphoric acid in the electric furnace. Phosphoric acid made cheap by this process can be used to fix ammonia. Briefly described, the average mixed fertilizer contains approximately 3 per cent of ammonia, 9 per cent of phosphoric acid, and 3 per cent of potash, making a total of 15 per cent of plant food that is in a ton of mixed fertilizer.

The CHAIRMAN. Is that what you call the 3-9-3 fertilizers?

Mr. SWANN. That is the 3-9-3. Down South we call it 9-3-3.

Of course there are many other mixtures for different crops in various sections of the country, but perhaps this mixture is the average used. There is a considerable quantity of nitrate of soda used directly, and some 16 per cent acid phosphate used in direct application to the soil. There are many other combinations, but I am speaking of the average in order to give you a more intelligent idea of how we propose to reduce costs not in theory, but in practice.

Of the three elements, ammonia represents, by weight, 20 per cent of the total.

First, let us consider the production of ammonia at Muscle Shoals by any of the synthetic processes. To the cost of ammonia there will be added the cost of sulphuric acid to produce sulphate of ammonia.

This extra cost we are trying to avoid, by fixing the ammonia gas with phosphoric acid and saving the cost of sulphuric acid. This is also true of ammonia from by-product coke ovens and gas works, that have a capacity estimated at 550,000 tons of sulphate of ammonia per year.

To produce a ton of sulphate of ammonia containing 25 per cent ammonia the by-product coke oven manufacturer must buy a ton of sulphuric acid as a wrapper to

wrap up the ammonia gas from the by-product coke oven. Let us assume that the average price, and of course that is subject to variation, of sulphate of ammonia is \$50 a ton and the average cost of the sulphuric acid delivered to the by-product coke oven plant is \$15 a ton. Then the by-product coke oven manufacturer only gets \$35 for the ammonia content of a ton, of sulphate of ammonia, and he must always have extensive storage facilities to store sulphuric acid and to handle it; saturators where the ammonia gas bubbles through a bath of sulphuric acid, a centrifugal for spinning and drying it, and so forth, and if he could sell all his ammonia liquid at \$35 he would have more net profit than if he sold it as sulphate of ammonia at \$50 per ton.

Let us see what happens? He buys a ton of inert material—too much of which sours the soil; he gets 25 per cent plant food from a ton of material. Out of 2,000 pounds he gets only 500 pounds of plant food. The other 1,500 pounds do no good, but costs something to sack and handle, and load on the railroad car and for freight on 75 per cent of inert material.

Senator McKINLEY. Why do they do that?

Mr. SWANN. Because up to the present time this has been the only commercial way of fixing the gas into a salt so that it can be used.

Now, we come to the process that we have developed on a commercial scale at Anniston, Ala.

The present method of making acid phosphate, the phosphoric acid content of fertilizer, is to grind phosphate rock, which contains an average of approximately 32 per cent phosphoric acid, and treat it with sulphuric acid, making an available salt by a process called acidulation, and obtain an average of 16 per cent phosphoric acid, commonly called acid phosphate or superphosphate. Then by the time it is mixed it contains about 8 or 9 per cent, or, say, an average of 9 per cent, so that, roughly speaking, the finished material contains about one-fourth of the plant food value that was in the original raw material. I do not believe you can show another great industry that dilutes its material and ships out in the finished form only one-fourth the amount of product contained in the raw material.

We charge into the electric furnace phosphate rock, using the Tennessee brown or blue lump, or Florida pebble. We charge silica rock or sand as there is an excess of lime present, and you gentlemen who are acquainted with the blast furnaces know they use limestone in fluxing out the excess silica present, whereas we have an excess of lime present and use silica rock to flux the lime.

The CHAIRMAN. You just reversed the operation?

Mr. SWANN. We just reversed the operation; yes. We also use a little coke braise—not as a source of heat, but as a reducing agent. We charge some cast-iron borings, to improve the operating condition of the furnace and produce ferrophosphorus, an alloy used in the manufacture of certain kinds of steel.

The heat of the electric furnace evolves the phosphorus present in the phosphate rock and is drawn off in the form of elemental phosphorus. In the inclosed furnace air is admitted, and when the phosphorus comes in contact with the air it burns to phosphoric pentoxide, a dense, heavy, white fume or gas. This is carried in gas mains through a cooling system and by condensation and electric precipitation is collected as a liquid, containing approximately 65 per cent phosphoric acid.

Now, let us see what we have done. The other process, using old methods—and I use the term "old method" advisedly because it is slowly but surely being superseded—dilutes it one-half, by the first conversion, from 32 to 16. By our process we raise it from 32 to 65, which not only reverses but doubles the "old method" on concentration. Our object is to get plant food delivered to the farmer in the most concentrated form, in order to save freight bags and all incidental expenses of handling it, so as to reduce the cost.

What is going to be done with this liquid phosphoric acid? The farmer won't use it in liquid form. I think later for some crops he will dilute with water and apply by spraying. But for the moment let us pass that as a dream that may come true. Here is liquid phosphoric acid, 65 per cent [indicating sample].

The CHAIRMAN. But let us pause right there. There is not any question but what if the farmer should use it, it would be a great economy, even though that economy were only in the handling and the freight alone.

Mr. SWANN. Absolutely no question about it; and I think I can satisfy this committee by explaining just the plain common sense back of it without any theory. Would you rather pay the freight on 1 ton than on 5 tons?

The CHAIRMAN. That is the point.

Mr. SWANN. That is all there is to this story; nothing else.

We take this liquid phosphoric acid and we can do three things with it that will have a tendency to cheapen the cost of fertilizer. We can grind phosphate rock just as the ordinary manufacturer does; and use liquid phosphoric acid to acidulate or

treat ground phosphate rock and make triple superphosphate containing 48 per cent phosphoric acid, or three times the strength of the ordinary acid phosphate.

Roughly speaking, of this product about two-thirds comes from the liquid and one-third from the rock, the last third being obtained very cheaply, as concentrated phosphoric acid can be used to treat ground phosphate rock and make available the phosphoric acid content in the same manner as sulphuric acid, thus using a liquid plant food instead of an inert material.

Taking up the question of ammonia gas, produced by the by-product coke oven process, the cyanamid process, the Haber process, the Casale process, or any of the processes, and you fix ammonia gas with phosphoric acid, a plant food, and use a liquid plant food to wrap up a gaseous plant food and produce a salt, ammonium phosphate, in varying proportions up to 13 per cent ammonia and 62 per cent phosphoric acid. You put into a ton of material by this process 75 per cent of plant food, containing two of the three elements of fertilizer, how are you going to get the third, potash? There are several ways to obtain potash. We were fortunate enough to build a great big plant during the war for the production of ferromanganese. This plant was finished and produced ferromanganese during the war to an extent which was quite a substantial percentage of the total of the United States. When the war demand ceased the English came into strong competition with domestic producers of ferromanganese and we found it unprofitable to continue operation and therefore had to turn our plant to something else. I started to experiment on everything that had ever been made in an electric furnace. We had a map made showing the location of the raw material, the principal points of manufacture and of consumption; you could look at this map and say, "No, we don't want to make that in Alabama. We tried to find something which could be produced on a competitive basis at our plant, and finally determined upon something that had to do with phosphate rock, because the United States is supposed to contain something over 60 per cent of the world's supply of phosphate rock, and we are substantially midway between Florida and Tennessee, which contain great phosphate deposits of the United States not taking into consideration the western deposits, because they are too far away.

We obtained from our neighboring State, Georgia, potash-bearing shale, where there is a great tonnage. There is also close to Muscle Shoals potash-bearing shale that contains an average of about 8 per cent potash, and instead of charging silica rock into the furnace to flux out the excess lime, we charged in enough potash-bearing shale so that the silica contained in the shale would flux the excess lime, and contrary to many of the experts who, at that time, said we could not do it, we collected a potassium phosphate, which is a combination of phosphoric acid and potash.

Here [indicating sample] is a product that we collected on September 12, 1919. You see it is still in solution. It contains 7.94 per cent potash and 66.7 per cent phosphoric acid.

We also charged shale into the furnace by itself, volatilized the potash and collected it by electrical precipitation, and obtained as high as 40 per cent potash. This is a powder [indicating sample]. Strange as it may seem, the liquid and the powder came from the same process in the same way, and when they are combined form a liquid potassium phosphate.

I am not prepared to say to this committee that it is the cheapest method at the moment of obtaining potash. I think that with the low rates of exchange potash can be bought from Germany or France cheaper than it can be made by this process, under present conditions. But you have always this to fall back on. They can not charge you over a certain price for potash, because if they do you can make it yourself in the most concentrated form.

The CHAIRMAN. How does the price compare with present market prices?

Mr. SWANN. Senator, we made potash when everything was high, and potash was selling for \$4 to \$5 a unit. We have not made any recently, because we have been producing the food grade phosphoric acid in order to make this development pay its own way. I will not go into detail with regard to the method that we have used in this development or how much money we have spent. We expended many hundreds of thousands of dollars in experimental work; in fact, several times our total capitalization on this development up to date.

We have not made any potash from shale due to the present price of power, nor do we expect to or intend to, except to show and prove that it can be done. Later on we are going to get some cheaper power. I will say this, that, in my opinion, with some of the cheap secondary power which is available for short periods of the year, you can afford to make potash—or, I will put it in another way. You can not afford not to utilize the power that otherwise might be lost.

I am, essentially, a power man, that being my early training. I was sales manager for the Alabama Power Co. shortly after they started, and prior to that with a company

in West Virginia, where in the same capacity, I sold the output of their plant before it was finished. Therefore my early training was in connection with the selling and utilization of power. It was only natural when entering business for myself, that I should take up electric furnace operation as I had spent 10 years in what was in effect the study of the relation of power to the product.

Furthermore, in the South we have seasonal stream flow. By that I mean a great deal more power is available for seven, eight, nine, or ten months out of the year than for the total year. I wanted to find some industry where the investment cost was so low, where the cost of equipment was low, and where the cost of labor was small, but where you could afford to use power for seven, eight, or nine months out of the year and make money on your investment. That is what I have been searching for during the past five years. It is a well-known fact that there are many power sites in the South that could be developed. There is always a certain amount of secondary power which you can not afford to make primary notwithstanding the fact that storage reservoirs will be built, which will also serve to relieve the flood conditions. This matter is before Congress and in due time will receive consideration. But you can not make all of the power primary; as it would not be profitable to store all of the water and distribute it evenly over the entire year. The fertilizer industry is a seasonal business, so it seems rather natural to develop the use of seasonal power for a seasonal business.

My whole thought has been to work my theory out, but I have had to make the operation pay. I will admit that it did not pay for a while, and in the first stages we spent all the money we had—not only that, but the money of a lot of other people; however, it is paying now, and we are making money.

I stated that we had a total of eight furnaces and that we were running one. Some one asked me when we were going to put on the second furnace, and I said when we made enough money out of the first one to put on the second one, to provide working capital. This we did.

When I was before the House Committee on Military Affairs we were operating one furnace, and we made enough money to put in a second one. Then enough to put in a third one, and we are now using over 10,000 horsepower. A lot of people said that the process was not practical, and we could not do it, but we are doing it and are making money. We are going along and allowing the other fellow to say that it can not be done.

The CHAIRMAN. Where do you get your power?

Mr. SWANN. From the Alabama Power Co.

The CHAIRMAN. What does it cost you?

Mr. SWANN. Something over 6 mills a kilowatt-hour, which is around \$36 a horsepower year. That is primary power, and we are negotiating with them for a large block of power from Mitchell Dam, their new development.

The CHAIRMAN. You are preparing to get a supply of secondary power there?

Mr. SWANN. To use secondary power only. We want to consider locating our fertilizer plant—that is, a small unit of one—at the dam and to take power directly from the generators through one transformer.

The CHAIRMAN. Your product is fertilizer, is it? Is that what you sell?

Mr. SWANN. At the present time, a large part of our output is ferro phosphorus and food grade phosphoric acid. I think I had better explain what I mean by food-grade acids. The great use of phosphoric acid is in the fertilizer industry. Roughly speaking, it would take some 600,000 horsepower to make the phosphoric acid that goes into fertilizer. Something like 25,000 to 30,000 horsepower would make the phosphoric acid for the food grade product. You would be surprised, perhaps, to know how many uses there are for phosphoric acid. If you had biscuits this morning, your baking powder was partially phosphoric acid. The selfrising flour that we use so much in the South has a certain amount of calcium acid phosphate, which is merely lime mixed with phosphoric acid. In the manufacture of hydrogen peroxide phosphoric acid is used. If you happen to drink soft drinks, there is some phosphoric acid in most of them. If you go to a soda fountain and order an orange phosphate the boy will take up a bottle and give it a few shakes. That is phosphoric acid. The sugar you use has been clarified with phosphoric acid.

The CHAIRMAN. Who are your customers, to whom you sell your product?

Mr. SWANN. We sell to the sugar refiners, the baking-powder manufacturers, the soft-drink manufacturers, the peroxide manufacturers, yeast manufacturers, and to the medicinal trade.

The CHAIRMAN. Do you sell to the fertilizer companies?

Mr. SWANN. We have sold what fertilizer we have made directly to large fertilizer manufacturers because we did not have the organization to distribute it at the time.

The CHAIRMAN. From what source do you get, of these various things that you have mentioned, your largest revenue?

Mr. SWANN. We get our largest revenue from the higher priced acids, known as food grade.

Senator MCKINLEY. What did you say then?

Mr. SWANN. Food grade; that is, phosphoric acid used for food purposes. The reason they like our acid better than they do that produced by the old method is because of the high degree of purity. Phosphoric acid is ordinarily made by acidulating or treating phosphate rock or bone with sulphuric acid. This method produces a weak solution that must be concentrated and in which many of the impurities remain. We start in with a solution five or six times stronger than the one by the old method, and the larger part of the impurities go out in the slag. The only impurities we can get in our acid are those that go over in the gas, and for this reason it is particularly adapted to food grade purposes that call for low impurities. For instance, the pure food law requires that arsenic must be less than 1.43 parts per million.

I think there is one brief statement that I can make that will size the whole situation up:

How much power does it take to make a ton of acid phosphate? Then you can compare that with the sulphuric acid method and there is the whole basis. In the first place, no one had ever developed a furnace that was a success over a period of time. We have had some seven or eight different types of furnaces. I suppose we have spent at least \$200,000 in constructing and reconstructing furnaces alone to find the correct design, to find the correct design of a furnace. There are a lot of technical details that I won't bother you with. It is just like the new ammonia process at plant No. 1, that did not quite work. I think eventually a cheap process for synthetic ammonia will be worked out. It perhaps will call for more experimentation than has been used in connection with phosphoric acid, but I am of the opinion that it will be worked out.

We wanted to develop this process commercially. We wanted to be sure, and have now gotten to the point where we know exactly how to do it. I will say frankly that what we term "condensation" is something that happened accidentally, but we finally learned how to control it. We did not know, but we simply kept looking until we found out what it was. The first step was to develop a furnace. The next step is to properly operate the furnace. I will say to you, gentlemen, that an electric furnace is as sensitive as a dyspeptic to what you feed it. We know that by sad experience. You put in a certain size of phosphate rock and you will not get results. If you have too large a quantity of fines you won't get good results. On the other hand if you put coarse coke in you will have lots of trouble. It must be coke braize, which happens to be the cheapest form of coke. We did not find that out for a long time. We tried lump coke and it did not do right; then nut coke, and finally coke braize. There are a great many of these points, and I could spend a week telling you what not to do with an electric furnace, and I could put down on a sheet of paper the things that we know how to do. It is still in its infancy; we have just started. I watched our power consumption and I wanted to find out, having been a power man, the kilowatt-hours per pound of phosphoric acid. A great many of your witnesses have spoken of it in the term "per horsepower year," but it can all be computed back to the common rate of exchange. I have watched our power consumption go down month by month, and our recovery go up. By recovery I mean that we buy from the phosphate rock miners so many tons of phosphate rock that contain so many pounds of phosphoric acid, and we ship out so many pounds of material that contains so many pounds of phosphoric acid. The difference between that we buy and sell is the recovery. For a while it was low. I will say this, that if the recovery is satisfactory phosphoric acid can be made in the electric furnace which has been developed, and that three furnaces are operating now and making high grade phosphoric acid cheaper than it is now being made by the old sulphuric acid process.

The class of power naturally plays an important part in this element of fertilizer material, but fortunately the investment in plant to make phosphoric acid is low. Therefore you can afford to have your plant stand idle a longer period of the year than you could if your capital cost was high.

The CHAIRMAN. What about the labor?

Mr. SWANN. The labor is comparatively small and will be reduced by further use of labor-saving devices.

The CHAIRMAN. You would not lose your labor organization, then?

Mr. SWANN. No. We expect, ourselves, to use a certain amount of secondary power. The question of secondary power is a very important one. If you have a lot of power and can not afford to turn it all into primary power, then the thing to do is to find out how you can use it as secondary power most economically and make the greatest profit on it.

I believe that time will prove that the manufacture of phosphoric acid by this method is the keynote to the fertilizer industry. The reason for that is this: You take liquid phosphoric acid and fix gaseous ammonia from whatever source it is obtained, or take liquid phosphoric acid and treat phosphate rock and make concentrated acid phosphate, so that it serves a dual purpose.

Coming to the point of how the farmer is going to use it, I want to say that I have great respect for the intelligence of the farmer, and I believe that when you show him that he can get something concentrated and dilute it himself at a lower price, that he will use it.

Now, take the question of the filler in fertilizer. There is a filler in the fertilizer, not because the manufacturer wants to deliberately put the filler in, but by virtue of the process that he uses in making it the filler is there. To repeat, he takes his phosphate rock, gets 16 per cent phosphoric acid, and the other 84 per cent is inert material. He takes sulphuric acid, fixes the ammonium gas from the by-product coke over, or from any of the other processes, and he gets 25 per cent plant-food material, the other 75 per cent being inert material. There is no necessity for that, and if the farmer is a dirt farmer he surely would have enough dirt on his place to mix with this concentrated fertilizer, and that is all that it amounts to, dilution—

Senator HEFLIN. And teaching him how to mix it, of course.

Mr. SWANN. Yes. I will say this, that I do not believe the average farmer will buy acid phosphate from one manufacturer, sulphate of ammonia from another, and potash from still another and then attempt to mix these together. However, when you give him something that all he has got to do is dilute it, he is going to buy it, provided he can save money.

I am making up a considerable quantity of concentrated mixed fertilizer and will send it to every experimental station and farm organization in the United States, for test purposes. The directions will say "Mix this sack with four sacks of dry dirt or dry sand." The problem is dilution, not a chemical problem of mixture or a scientific problem that calls for any great skill. You may naturally say, how far will he go to mix it? Let us suppose that the average small farmer did not mix it. Then what will you do? How are you going to cheapen the cost of fertilizer? That, I understand, is really the problem that this committee is concerned with. You are going to cheapen the cost of fertilizer by using phosphate rock as near the mine as possible, and very fortunately Muscle Shoals is well located with respect to phosphate rock; then you are going to ship to distributing points in the most concentrated form, and if you will ask some of the fertilizer manufacturers the percentage of the total cost represented by freight bags and handling you will be astonished. This can be greatly reduced by use of concentrated plant food.

I think the large users of fertilizer will buy concentrated mixed fertilizers and dilute it themselves. What the farmer wants to buy is plant food, not some particular brand of fertilizer known as the "Black Crow" or the "Green Goose" or something of that kind. He wants a fertilizer containing, for his particular crop, as much of the three elements of plant food as he needs. That is what he is interested in.

Senator NORBECK. Some people are quite partial to patent medicine labels. Is that true with fertilizer labels?

Mr. SWANN. Yes, sir; but they will get over that. It may be a slow process, but it will come, and then the farm associations and others will have simple little mixing plants and buy a carload of concentrated mixed fertilizers and dilute for use in their immediate neighborhood.

That is perhaps the logical way in which it is going to work out. I do not believe all the farmers will buy it. I might say, by way of illustration, that the ordinary grade of phosphoric acid is sold as 50 per cent. We started selling 75 per cent, because we had to dilute it from 90 per cent, and I know that some of the manufacturers would not buy the 75 per cent and we have had to add water to dilute it to the grade they had been using. I have said to a number of them, "You have water around your plant; why don't you put some in and save the freight on water? That is all we do." It was new to them; they did not know the technical side and did not realize how simple it was. I think a campaign of education will correct this.

Very fortunately this process is worked out now. We know the unit of power that is required, and that you can make fertilizer and deliver it to the farmer cheaper than it is now being delivered and at a profit. I mean that our cost of manufacture is less than the old method. I think we could very properly say the "obsolete" method. It is true there are very heavy investments in acid phosphate plants and sulphuric acid plants throughout the country, but like everything else in progress, when there is a development which makes a process obsolete it must be replaced. It is rather unfortunate for the manufacturers who own these plants, but nevertheless progress demands that the cheapest process be used.

Senator NORBECK. I would like to ask a question right here to get your viewpoint in regard to the relation of cheap power to cheap fertilizer in a little more concise form, if you can state it.

For instance, if you reduce the cost of power from 10 mills to 1 mill, what effect would that have on the cost of fertilizer by the present method and then by the method that you speak of? In other words, is power a large or comparatively a small factor in the cost of fertilizer?

Mr. SWANN. Roughly speaking 100,000 horsepower would make of the phosphoric acid content from 1,250,000 to 1,500,000 tons of mixed fertilizer of the grade now used. If you reduce the price from say \$25 a horsepower year to \$10 a horsepower year you would reduce the cost \$15 per horsepower or a million and a half dollars from the total power bill which enters into the cost of the phosphoric acid or about \$1 a ton of mixed fertilizer.

Senator NORBECK. About \$1 a ton?

Mr. SWANN. For the phosphate element alone.

Senator NORBECK. What would that reduce the ordinary commercial fertilizer per ton?

Mr. SWANN. As I say, about \$1 a ton.

Senator NORBECK. And fertilizer to-day is around \$40 to \$50 per ton?

The CHAIRMAN. Senator, he is speaking of only one ingredient there. He is not speaking of the nitrate or the potash.

Senator NORBECK. Will you apply that to the commercial fertilizer as it is now sold—

Mr. SWANN. The greatest advantage that you are going to get from concentrated phosphoric acid comes from the elimination of the sulphuric acid in the fixing of the ammonia.

Senator NORBECK. Speaking of the new process?

Mr. SWANN. Yes, whatever the cost of the ammonia may be; and I think you gentlemen can rest assured that ammonia is going to be produced cheaper than it is being made to-day. New processes are going to be worked out and old ones improved.

Senator NORBECK. Let me put my question in another way. Will the reduction come through the different process, rather than through simply the cheapening of power?

Mr. SWANN. Why, the cheapening of power bears just exactly the ratio to the cost as the amount that the power bill is reduced.

Senator NORBECK. But the thing I haven't been able to get, even under the present method, is whether the power is 10 per cent or 25 per cent of the cost, and therefore I don't know how much cheap power will reduce the cost of fertilizer. I have not been able to get that information at this hearing. I have not been able to get anybody to see, if he can reduce the cost of power from 10 mills to 1 mill, how much that would cheapen the commercial fertilizer per ton?

Mr. SWANN. I will say that our power represents from 20 to 25 per cent of our total cost to-day. There is a direct statement for you.

Senator NORBECK. Then if you reduce the cost of power one half you reduce the cost of fertilizer 12½ per cent?

Mr. SWANN. Yes, sir.

The CHAIRMAN. Now, Mr. Swann, how cheap, by your electrical-furnace method, would you have to have your power per kilowatt hour in order to produce phosphate at the same price it costs now in making fertilizer?

Mr. SWANN. Now, Senator, I am not trying to avoid that answer, but it is difficult to make a comparison, because we make a different product, a higher concentrated product.

The CHAIRMAN. You understand the importance of the question?

Mr. SWANN. I see the importance of it, and I am going to try to answer it for you.

The CHAIRMAN. If you will.

Mr. SWANN. Power at two mills per kilowatt hour is an estimate that I have used in working up the cost of a fairly large unit.

Senator NORBECK. How much?

Mr. SWANN. Two mills per kilowatt hour, which, roughly speaking, is about \$12 per horsepower year. There are 6,535 kilowatt hours in a horsepower year. But, as you all know, the furnace does not operate every minute of the time, and 6,000 kilowatt hours is generally considered good practice out of the 6,535, so that at 2 mills 6,000 kilowatt hours is \$12 per horsepower per year, and fertilizer can be made, per unit of phosphoric acid, at a cost considerably under the lowest cost that I have been able to find that acid phosphate is being made for to-day. You have only started with your advantages, and that is why I hesitated in answering that, because the fertilizer made to-day that you are comparing with ours, is 16 per cent, and ours would be 48

per cent. Now, you would have one ton to pay freight on instead of three tons. I have said that the freight paid on sulphate of ammonia in the Birmingham district from the by-product coke ovens and the cost of sulphuric acid amounted to such a large sum that you could operate the phosphoric acid plant at a loss and make money. By this statement I mean that you could operate your phosphoric acid plant at a loss and you would save so much money in fixing the ammonia with phosphoric acid thus eliminating the use of the sulphuric acid and saving two-thirds on freight, that your total profit at the end of the operation would be substantial.

Senator NORBECK. You will pardon me if I ask the question over again, but I am not sure that I understood you and want to get it clear. When you said that power was 25 per cent of your cost I think you said it was power at 6 mills.

Mr. SWANN. Yes; and that was a small operation, comparatively, to the fertilizer—

Senator NORBECK. That cost applies to your finished product here, and not to commercial fertilizer as it is sold?

Mr. SWANN. That is it.

Senator NORBECK. All right. If you succeeded in reducing your cost \$6 per ton it would be equivalent to \$2 per ton in the case of fertilizer which has a lot of filler in it: is that it?

Mr. SWANN. If you reduce your cost—no, not \$6. If you reduce your cost from \$36 for power to \$18 for power, power cost would be one-half and that would be reducing your total by 12½ per cent.

Senator NORBECK. And you are speaking of a concentrate that has three times the plant food in it that is in that ordinarily put out?

Mr. SWANN. Yes.

Senator NORBECK. And then you would put to that enough filler, in the form of something, to make three tons out of that?

Mr. SWANN. No; but in all my figures I have been attempting to go back to the ton of phosphoric acid in the finished product so as not to confuse you with these figures.

Senator NORBECK. Which is only one of the elements in the fertilizer.

Mr. SWANN. Only one of three, but which, by virtue of it being a liquid element and a saving having been made in the use of sulphuric acid and in the fixing of the ammonia element, and the saving in freight, is of great importance, greater than even the treatment of the power—

Senator NORBECK. I can see that very clearly, but what I am still trying to get is: What would free power do toward cheapening commercial fertilizer per ton, as the farmer puts it on his field?

Mr. SWANN. My direct answer was the difference between \$10 power and \$25, which would reduce the cost about \$1 a ton.

Senator HEFLIN. In a ton of fertilizer, what proportion, in pounds, is the filler?

Mr. SWANN. The average fertilizer is about 15 per cent plant food, say 300 pounds and 1,700 pounds of filler.

Senator NORBECK. If we are to have cheap fertilizer, the answer is not simply cheap power, but you have got to find the answer in other ways of offsetting cheap power? Is that it?

Mr. SWANN. It certainly is true that cheap power bears just the relation that the cost of power bears to the total cost.

Senator NORBECK. Which is comparatively small, I take it?

Mr. SWANN. Yes, sir. With respect to the other savings that have been brought about, we find that with regard to a number of them, even with the price we are paying for power, we could never have operated if the cost of power had not been comparatively small. You understand that as a buyer of power I want my power just as cheap as possible, and that I can make a legitimate profit and sell my product cheaper as I get the power cost reduced. The point I want the committee to see, which is the common sense back of it, is that there are advantages in our process, which we have worked up and which are working that are very great—

The CHAIRMAN. Your processes are patented, I presume?

Mr. SWANN. Yes, sir.

The CHAIRMAN. Have you taken into consideration the Government plants, either one or both of them, at Muscle Shoals, in connection with the use of the process that you have developed?

Mr. SWANN. Mr. Chairman, I have been in Alabama since 1913. My thoughts have been about Muscle Shoals as much as any other one project. When I was sales manager of the Alabama Power Co. I did some of the original work on the commercial side of the development. Ever since starting in my own business in 1917 I have always had in mind that sooner or later I wanted to work out something that had to do with

Muscle Shoals power. I started this company in a very small way. To repeat, I own control of it. I have not enough money to go into the fertilizer business on a large scale. All that I am trying to do is to work these processes out to such a commercial success, so there will be no question about it and make the process available on a very reasonable basis to the Government or to anyone that might get Muscle Shoals, and keep for ourselves the higher price food grade acid business.

The CHAIRMAN. Plant No. 2 is designed to produce a different element of fertilizer product, the nitrate part of it.

Mr. SWANN. Yes.

The CHAIRMAN. Would you be able, with your process, to utilize plant No. 2 without very extensive changes, to produce the phosphate part of it?

Mr. SWANN. The Government, in its estimate as to the utilization of the plant, when it was talking about operating it, called for a substantial investment to add a sulphuric acid plant to produce sulphate of ammonia. You would entirely eliminate this cost by utilizing our process for making phosphoric acid, because you would stop the cyanamid process at the point where you obtain ammonia gas and would fix ammonia gas with phosphoric acid and eliminate the cyanimid process from the point where the gas is produced.

The CHAIRMAN. It is about two-thirds through when it gets to that point, isn't it?

Mr. SWANN. Approximately.

The CHAIRMAN. How much additional machinery would they have to put in and how much machinery there now would be made useless?

Mr. SWANN. The machinery up to that point would be used.

The CHAIRMAN. Just as it is now?

Mr. SWANN. Yes; and the machinery from that point on would simply stand idle as a reserve, if the Government wanted it to.

The CHAIRMAN. In other words, the plant you have in mind would not interfere with the Government retaining plant No. 2 in a stand-by condition?

Mr. SWANN. Not at all.

The CHAIRMAN. To be used in case of war?

Mr. SWANN. Yes.

The CHAIRMAN. For the purpose of making explosives until at least they have reached a point where some cheaper method could be used?

Mr. SWANN. Until some other process is worked out and put into operation that would justify abandoning it?

The CHAIRMAN. Yes.

Mr. SWANN. As to the ammonia processes that you will eventually use, that is yet to be worked out and be made certain, you can not make sulphate of ammonia by the cyanamide process as cheaply as you can now buy sulphate of ammonia.

The CHAIRMAN. Then with respect to plant No. 1—

Mr. SWANN. Just the same thing. You could stop at the point where you get the gas, and fix the gas with phosphoric acid and produce ammonium phosphate.

The CHAIRMAN. That would cheapen it as compared with plant No. 2? How would that compare between plants 1 and 2, in cost?

Mr. SWANN. If we assume \$15 is the cost of the sulphuric acid, and to fix a ton of sulphate of ammonia containing 500 pounds of ammonia, and if we assume 3 per cent of ammonia per ton of mixed fertilizer, that would be 60 pounds of ammonia, or a ton of sulphate of ammonia would supply ammonia for about 8 tons of mixed fertilizer. Therefore, your saving in sulphuric acid would be nearly \$2 a ton.

The CHAIRMAN. As compared with what?

Mr. SWANN. As compared with the process suggested at the time the Government talked of operating Muscle Shoals for the production of sulphate of ammonia. This saving applies to any method of making sulphate of ammonia.

Senator McKINLEY. Just to get it to a point where I can understand it—that \$2 a ton, would that mean as compared with the Chilean nitrates?

Mr. SWANN. I referred to a comparison with the cost of sulphate of ammonia. Of course, in the final analysis you are concerned with a comparison in cost of the ammonia or nitrogen content. Of course, under the cyanamide process power becomes a tremendous item of the total cost. I believe the testimony of the Government experts here has been that with power at three-quarters of a mill per kilowatt-hour it would be rather difficult to compete with Chilean nitrates.

The CHAIRMAN. Yes; I think that is right.

Mr. SWANN. I do not know whether that included the cost of making it into sulphate of ammonia or not. Then if you reduce that by the cost of the sulphuric acid—

Senator McKINLEY. I do not believe I got an answer that I understood. You say that you are going to save \$2 a ton?

Mr. SWANN. I do not know what the cost of the Chilean nitrate is as compared with the cost—

Senator McKINLEY. It is perhaps \$50 a ton.

Mr. SWANN. I believe Major Burns can give us that comparison.

Major BURNS. I did not hear the question.

Senator McKINLEY. Mr. Swann stated that he could save \$2 a ton by not using sulphuric acid.

Mr. SWANN. Yes.

Senator McKINLEY. What would that mean in saving with fertilizer figured on the basis of what we know that the Chilean nitrates cost, say \$50 a ton, comparing it with the Chilean nitrates?

Major BURNS. My own opinion is that you could not make ammonium sulphate at the No. 2 plant to-day and compete with the Chilean nitrate at the present market. I do not know whether that answers your question or not.

Senator McKINLEY. At what price do you think they can make it per ton, and how would the price compare?

Major BURNS. My judgment is it would cost more to make ammonium sulphate at plant No. 2, when you include the power charges, than you could sell it for. Sulphate of ammonia is selling to-day somewhere in the neighborhood of \$55 a ton, and if you include all charges you could not make ammonium sulphate at No. 2 plant for less than \$60 per ton.

Mr. SWANN. Then if that \$60 a ton is the correct figure, and the cost of the acid is \$15—and that of course is subject to the cost of the sulphuric acid at the time—you could make it for the equivalent of \$45 a ton.

Senator McKINLEY. That would compete, all right, with the Chilean nitrate.

Mr. SWANN. You would have the added advantage of concentrated material to ship out. Instead of 25 per cent material, as they proposed to make, you would have 75 per cent of plant food to go out to the distributing points instead of 25 per cent, and if your freight rate, we will say, was \$3 a ton, you would save the equivalent of two freight rates or \$6 on a ton of material containing 75 per cent of plant food.

Senator HEFLIN. And the farmer to-day is paying freight on about 1,700 pounds out of a ton of stuff that hasn't any value as plant food?

Mr. SWANN. That is correct.

Senator NORBECK. In other words, the recent increase in freight rates added more to the cost of fertilizer than free power would reduce it under the cyanamid process?

Mr. SWANN. I haven't calculated that. Of course the freight rates made a tremendous increase in the cost of fertilizer and I believe you gentlemen will see that the freight rate is the outstanding important matter of this whole proposition.

The CHAIRMAN. As it is in almost everything else.

Mr. SWANN. It has the additional advantage that it can be diluted at or near the point where it is consumed. I think to-day, if you will permit me, although this sounds like I am boasting about my own process, that the outstanding feature in the whole fertilizer problem is the changed method of manufacturing of phosphoric acid, so that the phosphoric acid may be taken in liquid form and used to fix gaseous ammonia or to make a triple superphosphate and cheapen the total cost of your phosphoric acid.

The CHAIRMAN. At the present prices in a ton of completed fertilizer ready to put on the ground, which one of these three elements, nitrate, phosphorus, or potash, costs the most? Which is the most expensive?

Mr. SWANN. The nitrogen or ammonia is the more expensive per unit.

The CHAIRMAN. Which is next?

Mr. SWANN. I guess it is a toss-up between the potash and phosphorus.

Senator HEFLIN. If the farmer could get this fertilizer in liquid form, how would he apply it to the soil? Would he put it in a barrel and sprinkle it on the ground and plow it in?

Mr. SWANN. If you shipped it to him in this form he would dilute with water and sprinkle it on. The final product, I think, would be a salt, not unlike this [indicating] sample, containing 75 per cent plant food of the three elements, ammonia, phosphoric acid, and potash, and that if you would dump a sack of that into some sort of spraying tank on wheels and fill with water, to be regulated according to the amount desired and then sprayed on. That is for some crops. You understand I do not advocate that as a practice for everything, but I say it is coming for certain crops. I think Professor Whitney, Chief of the Bureau of Soils, testified along that line, too.

The CHAIRMAN. Your idea, as I understand it, is that the mixing of these three elements, these three plant foods, would be done at the factory?

Mr. SWANN. Yes.

The CHAIRMAN. Then the mixing of it with the filler would be done at or near the farm where it is used?

Mr. SWANN. Yes, sir. The filler could be dirt.

The CHAIRMAN. Yes.

Senator KENDRICK. But in any case it serves no useful purpose, except in the method of distribution over the land?

Mr. SWANN. That is all. I think I could go a step further. In Europe they do not use much mixed fertilizer, such as we have in this country. They use more of the concentrated fertilizer applied directly to the soil, and they buy and mix their own or apply to the soil separately. I think we are slowly coming to that. The fertilizer manufacturers are advocating higher strength fertilizer through the National Fertilizer Association. Only recently we had two very prominent engineers from Norway visit this country and our plant with a view to seeing if they could get the right to use our process in Norway, with their cheap water power. They went from our plant to Florida to see if they could buy their phosphate rock and ship it by water to Norway and use their cheap power to make liquid phosphoric acid and fix the ammonia. They had in mind getting some of their ammonia from Germany in tank ferries, making it into complete fertilizer and shipping it back to this country, and in view of low ocean freight rates as compared to high rail rates it may be that they can compete at certain points in this country.

Senator NORBECK. Why is cheap power such an important element over there, when it is such a small element here?

Mr. SWANN. They get their ammonia there, also the potash, and they ship a concentrated form at such low freight rates. The freight rates problem again. Also cheap power is far more important in the production of ammonia by certain processes than in phosphoric acid because it requires more power.

Senator NORBECK. Yes.

Mr. SWANN. They can ship their phosphate rock from Florida and their finished product back here about as cheaply as we can ship the phosphate rock from Florida to our plant. It is a question of freight rates again. That brings us up to a problem of railroad rates. Utilize the waterways to carry fertilizers. We are coming to it. That is the real strategic point of Muscle Shoals. I think, without question, we will see the day when tank barges will bring ammonia liquor from St. Louis, Chicago, Pittsburgh, and other important by-product coke oven centers to Muscle Shoals, and it will be fixed there with liquid phosphoric acid into concentrated ammonium phosphate.

The CHAIRMAN. To do that they would come down the Ohio River to the mouth of the Tennessee?

Mr. SWANN. Yes.

The CHAIRMAN. And then up the Tennessee River?

Mr. SWANN. Yes, sir. Then, that same tank will carry back a load of finished products that will be made there by some one, so you will have a haul both ways, I do not think this is an idle dream. This is a practical proposition.

Senator HARRELD. You can ship your phosphate rock from Florida up there.

Mr. SWANN. You can do that also.

The CHAIRMAN. But that would be a very long haul, if you did not haul it by water, because the mouth of the Tennessee River is so far away, that you would have to travel that distance twice.

Mr. SWANN. That is quite true, but there is a considerable distance between here and Norway.

The CHAIRMAN. Yes.

Mr. SWANN. And there is the question of inland transportation.

Senator HEFLIN. But the water rates, even then, would be much cheaper.

Mr. SWANN. The use of our waterways is coming. I think we all agree on that. The details are an incident.

The CHAIRMAN. In talking with a Government official who was operating a boat on the Warrior River from New Orleans to the headwaters of the Warrior River, which is about 50 miles from Birmingham, I learned that the great difficulty, as he put it, was that there was a haul divided between the railroad and the waterway, and that the railroad took it all and did not leave anything for the boat.

Mr. SWANN. I think that is true, and if you had gone one step further he would have told you he did not have a haul both ways.

The CHAIRMAN. Well, he hauled some coal back.

Mr. SWANN. Oh, yes.

The CHAIRMAN. I remember distinctly the one item of coffee. Birmingham gets a great deal of coffee from New Orleans, and he hauled it something like 400 miles on his boat. I believe their rate from New Orleans to Birmingham was 48 cents a hundred.

I think that is right, but I am speaking from memory only, and as long as the boat was on, the railroads put the rate down to 43 cents a hundred, and then they shipped coffee from New Orleans on the boat to within 50 miles of Birmingham, where they had it loaded onto freight cars and hauled to Birmingham; so that the railroad haul was 50 miles and the boat haul was the balance of the distance, several hundred miles, and the railroad got 38 cents out of the 43 cents, and the boat got 5 cents.

Mr. SWANN. No, Senator; the Warrior River Transportation Line can not show a profit operating on that basis, but that would be eliminated if it would come into Muscle Shoals.

The CHAIRMAN. Yes.

Mr. SWANN. You would have the entire haul?

The CHAIRMAN. Yes; but of course that is one of the things that must be regulated.

Mr. SWANN. Furthermore, you could distribute from Muscle Shoals by water a great tonnage of fertilizer. If you will just take a look at the map of the United States you will see the territory that could be serviced, especially when you not only reduce the bulk of your freight shipped, but also reduce the rate.

Now, from another standpoint, you are interested in Muscle Shoals and so am I, but you can make too much fertilizer at Muscle Shoals. You can concentrate the manufacture of too large a proportion of the total of the United States there. That will be governed by the amount of fertilizer used in the South. Slowly the Middle West and the far West will come to utilize fertilizer. This process is available to any other projects. However, Muscle Shoals, I think, can produce such a tonnage that it will be one of the controlling factors in the price of fertilizer, and with the concentration you can ship it out to territories that you can not ship to now. So there are many other projects in which there is some secondary power. You will notice that while I dwell upon secondary power I am looking for something to utilize secondary power because there is so much of it there and throughout the South. That is the basis on which I expect to be able to buy power from the Alabama Power Co.

Senator HARRELD. Most of the power in the South is secondary power, it is not?

Mr. SWANN. That is the truth about the situation. We have to have some steam plants to supplement the water powers. Of course, as you build reservoirs at the headwaters of the streams, that will be partly corrected, but I am a firm believer in the amount of power which is going to be used in the South and in the increased number of developments. Those developments are going to increase and multiply the amount of secondary power. Now, there must be some method of utilizing the secondary power from an economic standpoint.

Senator HEFLIN. You suggest that they might manufacture too much fertilizer there, Mr. Swann. Doctor Whitney, the Chief of the Bureau of Soils, testified here the other day that the farmers of the United States could, and he believed would, if they could get it at a reasonable price, use twice as much fertilizer as they have used.

Mr. SWANN. Senator, by that I mean that the cost of assembling and distribution from there would be too great, and that this process was available elsewhere. We should have been producing 10,500,000 tons instead of a maximum of 7,500,000 tons.

Senator HEFLIN. In 1920 it was nearly 8,000,000 tons, and in 1921 it had fallen off to a little over 4,000,000 tons.

Mr. SWANN. As I recall his testimony before the House Committee on Military Affairs, he testified that we should be using ten or twelve million tons now.

Senator NORBECK. Your position is this, that the farmers of the United States can be provided more cheaply with fertilizers by having a number of plants which are distributed than by attempting to do it all in one place, on account of the cost of transportation, and so forth?

Mr. SWANN. Yes; and as you work it successfully at one place, you will find other places to work it at.

Senator HEFLIN. How much can be produced at Muscle Shoals?

Mr. SWANN. That is a difficult question to answer, Senator. I should say from 1,500,000 to 2,500,000 tons. Of course, you will use a part of your power to make ammonia, a part to make phosphoric acid, and possibly a part to make potash.

Senator HEFLIN. By the use of that cheaper water power there do you not think it will do a great deal toward bringing down the price of fertilizer very materially as it is sold to the farmer?

Mr. SWANN. Yes; and what is going to bring it down, I think also, is the application of the new process, with all of the resultant savings along the line.

Senator KENDRICK. There seems to be a different kind of secondary power, graduated upon the length of time and the number of days in the year that it would be available. What would be the lowest number of days that you would consider economical to operate your plant?

Mr. SWANN. I am now designing a plant for Mitchell Dam in which I am going to try to buy five and six and seven months' power; that will average six months.

Senator MCKINLEY. What would your organization do the rest of the time, Mr. Swann?

Mr. SWANN. My organization is going to be very small. I will make up and store phosphoric acid. We will keep a small organization running throughout the year, mixing the phosphoric acid with the other fertilizer elements, and you would be surprised to know how few men will be used in a plant of that type. I can go still further and say that I think we could keep those men on pay and it would be more profitable than using primary power.

The CHAIRMAN. What would these men do who only worked five months; what kind of men are they—are they highly skilled labor or otherwise?

Mr. SWANN. No, sir; about 85 per cent of our employees are the ordinary Alabama negroes.

The CHAIRMAN. Well, they would like to have a holiday for five or six months each year.

Mr. SWANN. But labor is not a serious item in the total cost under this process. We are now putting in a mechanical stoker that will feed our furnaces, and we are going to apply the old principle of granulation of slag, where we cast our slag out in water, and it is granulated, and use some more electric power to carry it away. That is all done by hand now.

Senator MCKINLEY. You are speaking of your process now?

Mr. SWANN. Yes, gentlemen; that is what I am up here to tell you about, what we have done on our process and what we know about it in its application to the other fields and the other elements of fertilizer, and I think I can say without egotism that we have done more on phosphoric acid than anyone else in the whole world. It is not much, but it is more than anyone else has done. We have done enough to prove that it is commercially successful.

Senator KENDRICK. The principal claim of merit that you make, or one of your principal claims of merit, is the elimination of this unnecessary filler, is it not?

Mr. SWANN. That is it.

Now, there is just one other thing that I have not dwelt upon, but regarding which Doctor Whitney testified, that is important, perhaps. The phosphate rock has been mined in Florida, and in that connection I want to make this statement. The Government, in some of its publications, states that for every ton of contained phosphoric acid shipped away from the mines there are two tons left on the banks, similar to the culm banks of the anthracite coal fields in Pennsylvania. In that material, washed out, there is a lot of silica. We can take the raw rock as mined and put it in an electric furnace and we will not need to buy the sand and put it in. There is a large saving in this item.

The CHAIRMAN. Let us get that again. I do not quite see the point there.

Mr. SWANN. To prepare the phosphate rock for shipment they wash it after mining. They wash out a lot of the finer phosphorus, small particles like this [indicating]. That goes away with what is termed the gangue. They do not want that silica, and they can not afford to have that silica present in large quantities, if they are going to treat the phosphate rock with sulphuric acid to make it available; but when we charge it into the electric furnace we have to add sand, or some form of silica.

The CHAIRMAN. So you want what they throw away?

Mr. SWANN. We will not wash out what they throw away.

The CHAIRMAN. Yes.

Mr. SWANN. This is just as simple as can be. This is one of the great features of the electric furnace, and will save considerable on raw material. We are very wasteful in our methods of using our raw materials, even though we have large quantities available. That is a wasteful method, and you will find it referred to in several Government publications.

I am going to relate one more possibility, and will smile before I tell you about it, so you can smile afterwards, as it sounds like perpetual motion.

We obtain heat in the electric furnaces from the following sources: The electric power that we buy—the heat of the electric current; our means of smelting. We get some heat from the coke braise that goes in as a reducing agent. Nature gives up heat in the exothermic reaction of the carbon burning to carbon dioxide, and the phosphorus to phosphorus pentoxide. If any of you remember chemistry of your college days, you will recall the heat of the phosphorus burning to phosphorus pentoxide. There are four sources of heat. We lose heat in the radiation of the furnace and the gas mains; also that which goes out in the molten slag and ferrophosphorus which is tapped out, and there is left in the gases more heat than that which we buy as electric power.

We are getting in our process very little of the total heat generated and acknowledge it. The gases in the mains range from 1,000° to 1,200° C. We cool the gases with air and water to about a hundred degrees in order to collect the phosphoric acid. We have utilized but little of the heat, and it is a shame to waste it, but a method will be found to utilize it. This will greatly reduce the cost of making phosphoric acid.

These are some of the possibilities in the future. "Why are you not doing it right away?" you say. Well, we have done considerably more than anybody else, perhaps, but we have only scratched the surface of the possibilities.

That all has to do with the cheapening of the cost of fertilizer, and right here I want to state that there should be and there must be, if the industry is going to continue, a fair and reasonable profit to the manufacturer who produces fertilizer, but the manufacturer should and must discard the obsolete methods and adopt the most modern methods. Instead of using 8,000,000 tons of fertilizer, you would be surprised at how many millions of tons could be used. It will be a great economic advantage to this country if more fertilizer is used.

I believe one of the witnesses stated that you can grow the same crop per acre with fertilizer and you can do it with one man working as you could with two men without fertilizer. You can paint a picture of this that sounds like a Utopian dream, but there is a whole lot of truth in it.

To go back for a moment, we produced phosphoric acid on a small scale first, then built a larger furnace, and could not duplicate our first results. It was heartbreaking, putting something into it day after day and not getting anything out, but we finally found the right temperature and the right thing and that thing and the other thing. Any one of these things that I might mention would seem, even to a technical man, to be rather insignificant, but if you add them all together, they make the difference between a commercial success and one that is not. You might say, "Why have you stuck to this process?" Because we had to. We had a great big plant, nearly one-fourth as large as nitrate plant No. 2, with a capacity of 20,000 kilowatts, which is about 26,000 horsepower. We did not have anything for it to do. It was worth what we could scrap it for or what we could make it earn if we found something for it to do; so we had a prize of at least five or six hundred thousand dollars offered us to develop a commercial process. That is why we did it. Then, I was fortunate enough in having associated with me a large number of young men who did not know they could not do it, and they just kept plugging away.

Senator HEFLIN. Until they did do it?

Mr. SWANN. Yes; until they did do it. That is the strongest thing we have, our organization.

The CHAIRMAN. Now, Mr. Swann, I would like to get, if I can, in a sort of nutshell, the effect of your process upon the production of fertilizer.

Mr. SWANN. First, make a concentrated liquid phosphoric acid from phosphate rock; second, use that concentrated liquid phosphoric acid to either treat other phosphoric rock and make 48 per cent phosphoric acid as a salt three times the strength of the present method generally in use; third, use the liquid phosphoric acid to fix gaseous ammonia from any source, and save the cost of sulphuric acid; entirely eliminate the use of sulphuric acid in fertilizer, which is an inert material.

The CHAIRMAN. Now, I wish you would take those three things and give us the economy of each one of them as compared with the others.

Mr. SWANN. May I add one other there?

The CHAIRMAN. Certainly.

Mr. SWANN. Fourth, the resultant product of any of the mixtures will produce a fertilizer material running from three to five times the strength in plant food as the ordinary mixed fertilizers. There is the saving in freight, with all if the costs that go along with bagging, handling, and hauling and distribution.

The CHAIRMAN. Yes. Now, one great item involved in your process is the elimination of the high freight charges or any freight charges on unnecessary material. What other economies are involved in these four processes, or four stages of your process?

Mr. SWANN. In the making of the triple superphosphate you avoid the use of sulphuric acid, and you make the material three times as strong.

The CHAIRMAN. What I would like to do, Mr. Swann, if I can, so as to get it in a form so that we will understand it, so that an ordinary person will understand it, is to show just how much money will be saved by each one of these steps, if any, in the production of enough phosphate to make a ton of fertilizer, for instance. We are anxious to know, if we can find out definitely, just how much you cheapen the product.

Mr. SWANN. Senator, that is not a question that can be answered without putting so many "ifs" in it that the answer would not amount to much, for this reason: You have to know the freight rate on your finished material from the point where you are

going to manufacture to where you are going to ship. You have to know the cost of sulphuric acid used in fixing a ton of sulphate of ammonia, and that varies in different sections of the country. You have to know the cost of the phosphate rock delivered to point at which you are going to manufacture. There again the freight rate comes in and plays an important part. We can get phosphate rock from the Tennessee mines for \$3.08 a gross ton, and it costs over \$5 a ton from Florida.

The CHAIRMAN. Well, of course, you would buy it from the Tennessee mines.

Mr. SWANN. You can work that out by setting up one location with one freight rate and one location or several with an average, with the points where you are going to distribute.

The CHAIRMAN. Let us take Muscle Shoals.

Mr. SWANN. And then take your cost of rock and sulphuric acid and distribution.

The CHAIRMAN. Suppose the location is Muscle Shoals. The freight which you would pay under your process in shipping rock from Tennessee there would be exactly the same as under any other process? That would be exactly the same as under present conditions?

Mr. SWANN. We are working on this question now, to apply to the Mitchell Dam, but assume that we are going to make it by two processes. The Norwegians asked that very question that you have asked. To give you anything of real importance would require a lot of calculations, but I can give you the broader aspects of your concentrated fertilizer material and saving in freight rate, and I think it is very evident there is a saving.

The CHAIRMAN. Yes.

Mr. SWANN. Now, when you come down to the final analysis, the cost of phosphate rock is going to be the same. I can analyze that part of it for you. It is not that I do not want to give it to you, but I want to give you a statement that will mean something and not have so many generalities in it, which destroy the effect. The rock will cost you the same delivered to Muscle Shoals, irrespective of the process. Now the thing we want to know is whether it will cost more for sulphuric acid to acidulate phosphate rock than it will cost by electric power for operating the furnace.

The CHAIRMAN. What I am anxious to know is, by the utilization of your process how much that will cheapen fertilizer to the farmer as compared with what he has to pay for it now. You have told us very plainly, and I think it is quite plain to all of us, that one great item that would be saved would be freight, because it would be shipped in a concentrated form. Now, what is the reason that the present manufacturers can not ship these three necessary ingredients of fertilizer and mix them close to the place?

Mr. SWANN. I am glad you asked that question, because, under the present method, the best they can do, at a reasonable cost, is to make 16 per cent acid phosphate. We make 48 per cent.

The CHAIRMAN. So they can not do it in as concentrated form?

Mr. SWANN. The best they can do with sulphate of ammonia is 25 per cent, so the greatest amount of plant food in a ton is 25 per cent. We can easily ship 75 per cent. That is the real answer.

The CHAIRMAN. Yes.

Mr. SWANN. The elimination of sulphuric acid, which makes a dilute material, by the fact that you have used it.

The CHAIRMAN. The sulphuric acid itself is of no value as a fertilizer?

Mr. SWANN. Quite the contrary; too much of it sours the soil and is a detriment.

The CHAIRMAN. Yes.

Mr. SWANN. But, to answer your question, I have done a great deal of figuring on it because I thought I would be asked this question. I think, conservatively, you can say that you will make by this process complete fertilizers and deliver them to the farmer at at least one-fourth less than they are now being made for. I am talking about costs, eliminating all profit because, after all, there must be a profit on top of the cost.

The CHAIRMAN. Yes; of course there must be a profit.

Mr. SWANN. Now, the cost of your ammonia has a great deal to do with the total cost, and that depends on the process used for producing ammonia.

The CHAIRMAN. I do not know whether you have studied this question but, if you have, I want to get your viewpoint on this: Compare the cyanamid process of producing ammonia and the Haber process, as we have them down there, or not as we have the Haber process, because it is admitted to be incomplete, but supposing it was changed and remodeled in an up-to-date way.

Mr. SWANN. Senator, I do not pose as an expert on this question. My knowledge comes largely from association with men who know, and that is the most important point that we as a company have to decide, whose process is the best for us to join

with, or to use for our phosphoric acid, because I think I have made it clear here that ammonia can more economically be fixed with phosphoric than sulphuric acid, and that the two are companions to each other.

Now, I do know that the cyanamid process is being abandoned in Europe, and that the Haber process, or the so-called modified Haber process, is going forward in tonnage much more rapidly than the other, and my own opinion, which is based upon information from my associates, and I have one very prominent consulting engineer advising me on this subject, is that unquestionably the cyanamid process is a back number, and that either the modified Haber process, the Claude, or some of the other processes will supersede it.

The CHAIRMAN. Now, applying that opinion to the work of this committee on the job that we have before us, would it result in this, that, as representing the Government, we ought to advocate the complete reorganization of nitrate plant No. 1, so that we could make ammonia according to the modified and most up-to-date system, and the holding of nitrate plant No. 2 in a stand-by condition purely and exclusively as a war proposition? Would that be the result of your judgment?

Mr. SWANN. If I myself controlled Muscle Shoals I would put in the modified Haber process for making my ammonia, and keep in a stand-by condition cyanamid plant No. 2, and operate it at such periods of the year as secondary power was available that could not be used otherwise, and if the cost of the ammonia in its finished form justified its operation, I certainly would keep the plant in a stand-by condition until such time as it was definitely proved that you could afford to scrap it.

Now, I think this, that the use of phosphoric acid to fix the gaseous ammonia may—there is a great big question mark after the word “may”—give the cyanamid process a little lease of life at Muscle Shoals by saving the cost of sulphuric acid, but eventually you are going to abandon it and use one of the other methods.

The CHAIRMAN. As a peace proposition, however much we might regret to reach the conclusion, do we have to reach the conclusion that we can not make fertilizer at plant No. 2 and be able to cheapen the product?

Mr. SWANN. That is my judgment. I do not think you can.

The CHAIRMAN. Of course, none of us want to reach that conclusion, but there is no use in lying to ourselves or in deceiving ourselves.

Mr. SWANN. I am afraid that that will be your final answer. I say that from the standpoint of Government investment.

The CHAIRMAN. The possibility of reducing the cost of fertilizer to the farmer rests on our ability to handle plant No. 2 and, if necessary, build another and a bigger one.

Mr. SWANN. Yes; and either fortunately or unfortunately, the farmer thinks he is going to get cheaper fertilizer.

The CHAIRMAN. Yes; and we ought to tell him the truth.

Senator HEFLIN. The way to get the fertilizer is to keep on fighting it, is not that true?

Mr. SWANN. Yes; and to go further than you have gone.

The CHAIRMAN. Oh, yes; we want to do that.

Mr. SWANN. When you have cheapened to cost of ammonia you have just started. You are dealing with 20 per cent of the total. Do not quit there; go on and finish the job. You can do it; the way is being pointed out here now.

The CHAIRMAN. I think so. I have not abandoned the hope at all of cheapened fertilizer. I think we are going to do that for the farmer, but first it looks to me, taking the judgment of the scientific men, that the road to travel is not along the cyanamid process of plant No. 2. The proposition was that we can do better by taking the modified Haber process, and I do not mean to be confined to plant No. 1, which is a comparatively small plant, as you know, as compared with plant No. 2; it is just a midget.

Mr. SWANN. Yes.

The CHAIRMAN. And if we can demonstrate there that we can produce it, then it is only a question of a very short time until we can erect a much larger plant, or several of them, for that matter, by the most modern methods.

Mr. SWANN. That is true, and that will likely be the result. Plant No. 2 has served its purpose. I do not consider the money lost.

The CHAIRMAN. Oh, no; and it may serve a great purpose still; in fact it will, even as an insurance proposition.

Mr. SWANN. As an insurance proposition. Both from the standpoint of war and peace, it is a good thing to have it in stand-by condition.

The CHAIRMAN. For the same reason that we build a battleship and do not use it in peace time.

Mr. SWANN. Yes.

The CHAIRMAN. It stands there like a battleship; it will be expensive to operate but when we are at war that expense will be a comparatively small thing.

Mr. SWANN. It will be incidental, yes, sir.

Senator HEFLIN. Well, it is claimed by some of the friends of Mr. Ford that he had a secret process by which he is to make fertilizer much cheaper than it is being made to-day and that, by the use of this cheaper water power at Muscle Shoals he will be able to produce it and sell it at half the cost that is entailed upon the farmer to-day by the big fertilizer concerns of the country. Do you think that is possible?

Mr. SWANN. Senator, I do not know what the process is.

Senator HEFLIN. Well, you have worked out a process of your own that is quite an improvement on what they have there.

Mr. SWANN. It would be a guess if I attempted to answer that. All I know is what we have actually accomplished, and I have told you a few things of what we hope to accomplish by conserving some of the power and by using cheap rock that has not been washed out.

Senator HEFLIN. As I understand it, it is your idea that in time this old process they are using now will be abandoned for another and cheaper process.

Mr. SWANN. I have said, since I started on this work, that whether I developed it or someone else, it was going to be developed, that the old method of treating phosphate rock with sulphuric acid had to go, and I believe if you pin the fertilizer manufacturer down he will acknowledge it.

Senator HEFLIN. Why are all of these old concerns fighting your method, and why would they fight anybody else's method that is likely to make fertilizer cheaper?

Mr. SWANN. I do not recall offhand the total investment in the sulphuric acid plants in the South alone, but, if my memory serves me right, there is over thirty million dollars invested in acid phosphate plants. I should say that this process will make obsolete, to be very conservative, a great many million dollars' worth of equipment.

The CHAIRMAN. That is, your process, you mean?

Mr. SWANN. Yes, sir. Naturally this process comes pretty hard to the firm which will lose its investment. If you were a stockholder in one of these companies you would not like an announcement that a new process had made obsolete your investment; and suppose you owned the bonds on the equipment which then would be junk?

Senator HEFLIN. They are really afraid that if Mr. Ford gets hold of that Muscle Shoals project he will make fertilizer so cheaply that he will get their business; is not that true?

Mr. SWANN. They see our process working the way it is, and I will tell you frankly, we would a great deal rather they did not believe it. We hoped they would take us as a joke. That would give us a little longer lease of life. I know that my testimony before the Military Affairs Committee of the House was impugned, and they took back-handed slaps at me, but it did not affect the situation as to what we were doing. It did not change the fact that we are making money.

Senator HEFLIN. Is it not a fact that these big commercial fertilizer concerns are opposed to anybody getting hold of that power down there if they are going to use it for making fertilizer in competition with them?

Mr. SWANN. When I was in New York, about three weeks ago, the president and vice president of one of the large fertilizer companies had lunch with me, and they expressed the greatest interest in our process. They wanted to know what sort of a proposition I could submit to them, to put up to their board of directors, and I think they realized that a new method was coming in and that they must adopt it.

Senator HEFLIN. They have been writing here to Members of Congress urging that we not accept the Ford offer. I wonder why that is.

Mr. SWANN. Propaganda, Senator, seems to be one of the great things, especially since the war.

The CHAIRMAN. Senator, while I am not charging it to Ford at all, as a matter of fact 95 per cent of what I get are from people who are for Ford.

Senator HEFLIN. Oh, yes; I get a great many letters—

The CHAIRMAN. Do you think that is propaganda?

Senator HEFLIN (continuing). From all over, urging us to accept Ford's offer.

The CHAIRMAN. Do you think that is propaganda?

Senator HEFLIN. Well, probably it is, but it is the right kind of propaganda.

The CHAIRMAN. Oh, that is the idea?

Senator HEFLIN. Because he agrees to do something that will benefit millions of farmers.

The CHAIRMAN. Yes.

Senator HEFLIN. And he is going to use something that is now going to waste, that is, the power at Muscle Shoals, while the other fellows are trying to keep the farmers from getting this benefit, and want that plant there to lie idle.

The CHAIRMAN. That does not apply to me?

Senator HEFLIN. Oh, no.

The CHAIRMAN. And it does not apply to the mail that I get, because I have a proposition that would utilize it all, if my dream should come true.

Senator HEFLIN. Oh, yes.

The CHAIRMAN. Even to a greater extent than Ford proposes in his offer, and yet the mail that I get in regard to the bill that I favor as compared with what Ford is making is about 95 to 1. I have not paid any attention to either one of them. I think I know more about it than 90 per cent of the fellows that are writing to me. I may be wrong about it, but I am inclined to think that I do, and I am going to decide it on my own judgment, and not on theirs, whether I am right or wrong.

Senator HEFLIN. I was mentioning particularly these fellows who are now making the fertilizers and who control the prices absolutely. The farmer has nothing on earth to do with it.

Mr. SWANN. Senator, if I may say so, if they have been controlling the price of fertilizer recently, I would not want them to control the price of anything that I make, because they have lost more money than any other one industry that I know of.

Senator HEFLIN. Yes; they have lost money since 1921, the beginning of 1921, but that was because of the deflation policy and the purchasing power of the farmer, etc.

The CHAIRMAN. I suppose it is like a great many other things; it applies more to the farmer than to any other class of people in the world. A great part of their loss recently has come about on account of the unreasonable freight. Freight is a big item in the fertilizer proposition. It makes it very high—so high that the farmer can not buy it.

Mr. SWANN. Freight is the big thing. Freight stares you in the face anywhere you go.

Senator HEFLIN. You had this situation: In 1919 the farmer used a big supply of fertilizer and he got a good price for his products. In 1920 he bought a larger supply of fertilizer than he did in 1919, and his prices were good when he bought it; but when he came to pay for it deflation was on in all of its fury, and he could not pay for it. The fertilizer people did lose some money then, in 1921. The farmer said, "No; I am not able to buy this stuff; I do not get anything for what I am making," and he cut his supply of fertilizer in half. That is why they were hurt there, but in normal times they could get good prices for it. The farmer pays too much for it.

Mr. SWANN. The farmer pays too much for fertilizer because of the method of manufacture more than the percentage of profit that the fertilizer manufacturers make. I think, if you will dig right down into the facts back of it, the total profit made by the fertilizer manufacturer is not so great, but it is his method of manufacture, it is his cost of distribution; and the way in which he handles it; it is his credit loss and carrying charge, and all those things added together. It is really a very undesirable business to have your money invested in.

Senator HEFLIN. And the farmer pays for it all?

Mr. SWANN. In the final analysis, yes; but the other fellow does not make out of it what he is entitled to make, and what we want to do is to change a lot of these methods so fertilizer may be sold to the farmer at a cheaper price and leave a fair profit to the manufacturer.

Senator HEFLIN. That is what we are working for.

The CHAIRMAN. Now, is there anything else Mr. Swann, that you can think of that you would like to tell us about?

Mr. SWANN. I hope my statement here will not subject me to the same criticism to which I was subjected when I was before the House committee, that I was trying to straddle the fence as between Mr. Ford and the Alabama Power Co., because I am not trying to straddle any fence. I am here as the one manufacturer who is doing this on a large scale, to give you the benefit of our experience.

The CHAIRMAN. You have not any interest in this, outside of what you have already disclosed?

Mr. SWANN. No, sir.

The CHAIRMAN. Of course, you have a system that you want to have used, and that is a very laudable ambition; but have you any interest in the Alabama Power Co.?

Mr. SWANN. I have not a dollar's interest in the Alabama Power Co.

The CHAIRMAN. Have you any interest in these town lots that are laid out along the Tennessee River from Chattanooga to Florence?

Mr. SWANN. I would rather shoot craps to make money than to try to make it in that way.

The CHAIRMAN. You think you would stand a better show?

Mr. SWANN. I think so. My one interest is to try to make a reasonable amount of money out of having this process used, and it is available to the Government.

The CHAIRMAN. That is what I want.

Mr. SWANN. Or to Mr. Ford or to anyone.

The CHAIRMAN. You are ready to let anybody use it on reasonable terms, and you are willing to supply it to anyone who gets the Muscle Shoals project?

Mr. SWANN. Not only at Muscle Shoals but elsewhere in the country where it is needed, and when I say "reasonable" I mean very reasonable. As far as whom I am for, to be perfectly frank, I am for Theodore Swann, which, in turn means the Federal Phosphorus Co., which I think I have a right to represent.

Senator HEFLIN. Well, you think you have done a good service in working out this proposition that you have?

Mr. SWANN. I think so. I believe so, and I think I am entitled to make some money on it.

Senator HEFLIN. Mr. Ford may take your process.

Mr. SWANN. Mr. Ford received word from me, through his representatives, months ago, that he could use this process if he wanted to, that he could send his men to our plant and train them; that he could send his engineers there, on a basis which the representative thought whom I told about it, was very reasonable. In fact, I merely asked to get a block of power, say, 10,000 of primary and 15,000 of secondary, at about what he pays the Government for it, to utilize in my high grade process to make my product cheaper. If the Alabama Power Co. should get it and that power is available, and the Government operates the fertilizer plant, they can have it on a reasonable basis. If some individual takes it over, he can have it. I say to you frankly that we have tried to avoid publicity. Up to the present time we did not care for the people to know, in fact, what we were doing; I mean by that our competitors.

Senator HEFLIN. And now, since you have made good—

Mr. SWANN. In fact, I owed so much money that I did not want some of them fighting me. Very fortunately I just borrowed a large sum of money last week, and am all fixed up now. I am in good shape now and do not mind starting a little rumpus if I have to.

I might tell the committee this further, to be frank with them, that I got the money from the Alabama Power Co. I owed them a lot of money, and they funded my debt in three to 10 year notes, money that I had gradually lost in developing this process, but that does not mean that there are any strings tied to me whatever. It is not a question of neutrality but one of absolute independence, because I think you know that this had to be a company developed by some one man largely, and the associates that I have at Anniston are the ones that are responsible for its success.

The CHAIRMAN. Anniston is a suburb of Birmingham, is it not?

Mr. SWANN. It is 64 miles away from Birmingham.

The CHAIRMAN. In its boom days it was a suburb of Birmingham?

Mr. SWANN. Possibly, but the Anniston citizens would not like that. In fact, they rather kid me for saying that I am from Birmingham. I live in Birmingham, but I have my business in Anniston.

The CHAIRMAN. Which way is Anniston from Birmingham?

Mr. SWANN. East, towards Atlanta.

The CHAIRMAN. And how far are you from Atlanta?

Mr. SWANN. About 100 miles.

Senator HEFLIN. Anniston is a good city in itself.

Mr. SWANN. A good city.

Senator HEFLIN. Yes.

Mr. SWANN. It has a splendid labor market, and is a good town to live in.

The CHAIRMAN. You are not on any stream, are you?

Mr. SWANN. Oh, no; the Alabama Power Co. supplied the power from their dam 75 miles distant.

The CHAIRMAN. How far would it be from this Mitchell Dam that they are constructing now?

Mr. SWANN. That will be about 90 miles, but I propose to possibly locate at Mitchell Dam.

The CHAIRMAN. Oh, you are going to put up your plant right there?

Mr. SWANN. Yes; we are considering this location.

The CHAIRMAN. On what river is that?

Mr. SWANN. That is the Coosa River.

The CHAIRMAN. Which way from Birmingham?

Mr. SWANN. South.

The CHAIRMAN. The Warrior—

Mr. SWANN. Is west.

The CHAIRMAN. The Warrior is west?

Mr. SWANN. Yes.

Large power stations deliver most of the electric energy used in the rural communities, but in many places the farmers themselves have installed turbines and built private power stations, harnessing for this purpose swift streams and small waterfalls on their own properties. Those enterprises, however, are generally cooperative.

A great deal of the most arduous farm labor is performed by electrically driven machinery at a cost far below the cost of machines propelled by steam or horsepower or of hand labor. Water is pumped for cattle by electricity, threshing machines are driven by electric current, timber is sawed by motor power, and farm hands are no longer ordered to cut firewood by hand, because it is cheaper to have even that labor done by electricity. Candles have almost disappeared.

In many cases grain is dried and cleared by being passed through electrically driven hot-air fanning machines. It is not uncommon to find on the larger estates electric elevators which lift entire wagon loads of hay or grain and dump them where desired in the barns.

One Swedish estate owner has installed an electrically operated irrigation system, whereby a large field can be watered in times of drought. It is now only a matter of a short time till plows and harrows will be propelled by electric power.

(Whereupon, at 12.40 o'clock p. m., the committee adjourned until to-morrow, Saturday, May 13, 1922, at 10.30 o'clock a. m.)

development based on low cost factors, develop power with low interest rates and best serve the people of the whole Nation by making available cheap power for industrial use and cheap high grade fertilizer for agricultural production. As an illustration of the use of cheap electric power in agriculture I would like to submit an article appearing in the Evening Star, March 20, 1922 [article attached]. In Sweden natural advantages give them electric water power at low rates. There is only one way to bring our own water powers as low as about \$6 per horsepower year and that is through the low interest, amortization plan of financing proposed in Mr. Ford's tender.

So if Congress sees fit to accept the tender, made in good faith, you will put to work for the benefit of the public, the genius, money and training of this man on a basis that will take a great step forward toward freeing the consumers of the country from the unfair charges above mentioned. It would seem on the face of it that no one would hesitate but that a matter of so great importance to everyone would have prompt and favorable attention and action.

However, since this tender was made nearly a year ago, there has been a line up of opposing interests. Opposing it vigorously are those who have the viewpoint of the private interests seeking to maintain high cost factors, high interest rates and in maintaining present conditions. Opposing it also are those who believe in the Government itself completing and operating the development. Advocating the Ford proposal are those seeking relief from present conditions and who believe these problems can be worked out as private business under Government authorization and supervision.

I can readily understand why those of the large interests who are benefited by the present system oppose the doing of anything different, for they want to continue in the favorable position which they now occupy. I can understand why those who believe in Government ownership and direction should advocate the nationalization of the water powers, for we all realize that we are just on the threshold of great development of water-power resources for both power and navigation. I can also understand why the believers in individual initiative couple Government control or regulation and urge an immediate acceptance of this tender in order that this new method of development may be applied without delay. Now, of the three solutions there is but one at this time that can be quickly turned to the help and benefit of the distressed people of this land, and that is the development of this great water power by private initiative under Government regulation, for none but the selfish beneficiaries of the present system can claim that a continuation of the present conditions is beneficial. On the other hand, however much merit there may be in Government ownership and resulting administration, there is none that believes it possible at this time or for many years to come to secure from the people or from Congress a willingness to nationalize the water power, for to a great many minds the nationalization of the water power of this country would be a stepping stone to the nationalization of coal mines, railways, and other important and essential activities of our national life. So while the argument is on between these contending forces, the farmer remains discriminated against and is not given the relief to which he is entitled, the farmer's wife has not the comforts and advantages she is entitled to, the farmer's daughter who has been sent away to school is called home to serve with the unpaid labor on the farm, the son who is ready to be sent away to school is kept at home with the younger ones, and the whole family goes without the comforts of life, labor-saving devices, comfort-making equipment, and other things that rightly belong to them for the service they are rendering, and all of which is denied them because many of those who are authorized to act for them become more interested in protecting some existing thing or advancing some new theory than in applying the wholesome thing at hand for their relief.

MOST OF FARMERS IN SWEDEN UTILIZING ELECTRIC POWER—WATER PUMPED FOR CATTLE, TIMBER SAWED, THRESHING MACHINES DRIVEN BY THE SYSTEM—CANDLES HAVE ABOUT DISAPPEARED.

[By the Associated Press.]

STOCKHOLM, March 1.—Electricity has conquered one-third of the entire cultivated area of Sweden, according to the latest official reports.

If Sweden continues electrifying at the present rate it will only be a few years till almost the whole country will be run by electricity.

Most of the farms within the electrified area are now tapping the new source of energy, and nearly all the power used in the daily labor on these farms is derived from the high-power lines which span whole sections of the country.

power development down there, and if you know anything about the nitrate plant there, we would be glad to have any information you can give us in regard to the possibilities, and so forth.

Senator McKINLEY. Mr. Chairman, let me ask the witness this question first: What experience have you had, Mr. Merrill, in connection with water-power matters?

Mr. MERRILL. Before I came into the Government service I was in California, where for about two years I was engaged as an assistant to the consulting engineer of the Southern Pacific Co. in investigating water powers for purposes of railroad electrification in California, Oregon, and Washington.

The CHAIRMAN. And when you say "the Southern Pacific Co.," you mean the Southern Pacific Railway, do you?

Mr. MERRILL. Yes.

The CHAIRMAN. You are an engineer?

Mr. MERRILL. I am an engineer; yes, sir; a graduate of the Massachusetts Institute of Technology and a member of the American Society of Civil Engineers.

Senator McKINLEY. That is what I wanted to know.

Mr. MERRILL. In 1909 I came into the Forest Service. I went into that service from water-power work, and I have been engaged on water-power work for the Government ever since that time, which is nearly 13 years. During that time I was chief engineer of the Forest Service and in full charge of the administration of water powers in the national forests, prepared the regulations of the department, and prepared, in part, the measure that afterwards became the Federal water-power act. I was appointed executive secretary of this new commission when it was organized on July 1, 1920.

I might discuss briefly, Mr. Chairman, this question of the amount of water power down there, but I suppose you already have considerable of that in the record.

The CHAIRMAN. Yes; we have, but we would like to have your views on it also.

Mr. MERRILL. I went over Colonel Barden's testimony that he presented in the early part of the hearings, and as much of the balance of the testimony as I have been able to get hold of in typewritten form and read. We looked into the question of the amount of power available at Muscle Shoals pretty carefully last spring when I was requested to get certain information for the Secretary of Agriculture.

Of course, two individuals using the same data will not agree exactly, but these figures that I have here are very close to the ones that Colonel Barden gave you. They are in a little different form; that is all. I do not recall the exact figures he stated for Dam No. 2. Our figures show 74,600 horsepower, but that is for the lowest day in the 26 years of record that were used, and it does not, by any means, mean the amount that should properly be called primary power, because nobody ever thinks of developing power on the basis of having it there every day in the year for 25 or 30 years.

The figures that I have here include both Dam No. 2 and Dam No. 3, because they are both comprised in the Ford offer, and on the proposition that Dam No. 2 would develop 95 feet head, and Dam No. 3 would develop 40 feet head. This would give an absolute minimum at the two sites of about 106,000 horsepower.

There were two months, October and November, in 1904, which were the lowest on record for the 26 years of which we have a record. The figures of run-off for both of these months are in doubt. If they be disregarded, the primary power available for the lowest day outside of these two months, in the 26 years of record, is 79,200 horsepower at Dam No. 2 and 33,300 horsepower at Dam No. 3, or a total of 112,500 horsepower. If primary power be taken on the basis of the amount available 90 per cent of the time, the figures are: Dam No. 2, 123,000 horsepower; Dam No. 3, 52,000 horsepower; a total of 175,000 horsepower.

I have a diagram here,¹ if you care to examine it, showing, not the water discharges but the power available at the two sites. The portion of the diagram that is colored blue shows the amount of power available from water. If you will note the points where the dark green color extends down into the blue, you will see, represented by the dark green and compared with the total blue, the relative amount of steam power required to make all of the blue primary power and the periods during the several years of record when it would be necessary to operate steam plants to get the continuous output represented by the portion of the diagram colored blue.

There are approximately 130,000 horsepower in steam installation at nitrate plant No. 1, nitrate plant No. 2, and Gorgas. If that is used to fill in those depressions in the blue part of the chart, it is possible to get from the two dams and the steam plant 236,000 primary in combination. Each of the oblong blocks colored green on the diagram represents the 130,000 steam horsepower. A reference to the diagram shows:

¹ The diagram referred to is on file with the clerk to the committee.

that in only one year during the 26—namely, in 1904—would it have been necessary to operate the steam plants to capacity, and then only for a period of three months, in order to have made 236,000 horsepower continuously available. The longest period when it would have been necessary to supply auxiliary steam was for six months in 1914, but in none of these months would the full capacity have been required. Of the 236,000 horsepower years that would have been available from the combination of hydro and steam plants, 97 per cent would have been water power and only 3 per cent steam power. Seventy per cent of the water power would have been produced at Dam No. 2 and 30 per cent at Dam No. 3, so that—

Senator HEFLIN. Seventy per cent of that horsepower would be used—

Mr. MERRILL. Seventy per cent of the water horsepower.

Senator HEFLIN. Would be produced by Dam No. 2?

Mr. MERRILL. Would be produced by Dam No. 2, and 30 per cent of it by Dam No. 3. That is the approximate ratio. They both use the same amount of water. One will have a head of 95 feet, and the other a head of 40 feet, and the ratio of those two figures is approximately 7 to 3.

The CHAIRMAN. Do you not get more water from Dam No. 2 than you do from Dam No. 3?

Mr. MERRILL. Probably not; not an appreciable amount.

The CHAIRMAN. As I remember it, there is one quite large stream or river there that flows into the Tennessee between those two dams.

Mr. MERRILL. If so, it would make that amount of difference, but, as I understand it, the proportion you get from that stream is comparatively small. If there is any in there which is appreciable, it would make a slight difference in the ratio between these two. That is, with the two dams there, and with 130,000 horsepower of steam installation, you could get 236,000 horsepower of primary combination. That is continuous, 100 per cent, power.

The CHAIRMAN. Every day in the year?

Mr. MERRILL. Every day in the year.

The CHAIRMAN. Every day in every year?

Mr. MERRILL. Every day in every year, with the exception, I believe, of some 18 days in the 26-year period, which is too short a time to be worthy of consideration. That, of course, means it is not all water power. You are using periodically throughout this time some part of the 130,000 horsepower in steam to fill up the deficiency. The ratio, however, is as I have said only about 3 per cent steam out of the total, and about 97 per cent hydro.

The CHAIRMAN. That is on how much power?

Mr. MERRILL. Two hundred and thirty-six thousand primary combination from the two dams.

The CHAIRMAN. As I understand you, you mean you would get 236,000 horsepower, of which 97 per cent would be water horsepower, and 3 per cent would be steam?

Mr. MERRILL. Three per cent steam, although you would be using the steam plant now and then to nearly the full 130,000 capacity. There would have been four years, however, in the 26 when no steam at all would have been required.

The CHAIRMAN. Exactly.

Mr. MERRILL. Nevertheless, 3 per cent of the kilowatt hours would have been steam.

Senator McKINLEY. Of course, Mr. Merrill, that is a misleading statement, because you have to keep the steam plant there ready?

Mr. MERRILL. The steam plant would have to be kept ready. There is a saving, though, in fuel. It is largely a fuel saving and some saving in general operation charges when the steam plant is not running. The major saving, however, is fuel.

Senator McKINLEY. But your loss is in having to keep the steam investment and keeping it in shape?

Mr. MERRILL. You have all the time to carry the interest on your total steam investment and your depreciation on your total steam investment.

The CHAIRMAN. What investigation, if any, have you made in regard to the possibilities of increasing the primary water horsepower by the erection of storage dams in the upper Tennessee River?

Mr. MERRILL. I have not made any investigation of my own, Mr. Chairman. I am familiar, though, with the fact that the War Department has made and is now making investigations on the upper Tennessee River, with the idea of determining the possibilities of storing flood waters for the benefit of power and navigation. If that can be done, and to the extent that it can be done economically, will this site at Muscle Shoals be more favorable as a water-power proposition?

The CHAIRMAN. In your 240,000 horsepower—is it?

Mr. MERRILL. Two hundred and thirty-six thousand.

The CHAIRMAN. In the 236,000 horsepower how much secondary power would there still be there that could be used eight months in the year?

Mr. MERRILL. That depends upon the installation, Mr. Chairman. The Ford offer proposes 600,000 horsepower at No. 2 and 250,000 horsepower at No. 3. That is a total of 850,000 horsepower of installation. Now, the amount of power that you can get from that installation depends, first, upon your load factor and, second, upon whether you have water enough to do it; but, assuming that you have enough water, you can get out of 850,000 horsepower installation on a 60 per cent load factor an average of only 510,000 horsepower. That is, 60 per cent of your installation as your average output. Whether you can get that average output there depends, however, on whether you have the water to keep it running all the time.

The CHAIRMAN. But the idea that I am trying to get at is that when we have gotten as much primary horsepower as we can get by the use of steam plants to assist in low periods, there would still be times in the year when there would be some secondary horsepower, if we could find any use for it, that is going to waste unless you do use it. I want to get the amount of that.

Mr. MERRILL. I have estimated that if 850,000 horsepower installation was put in, operating on a 60 per cent load factor 510,000 horsepower maximum daily average could be had, if you could use the water behind the dams for daily regulation. That would mean, then, that you could get, on account of the deficiencies in water supply, even with 130,000 horsepower steam, only 460,000 horsepower of all-the-year average—that is, 460,000 horsepower-years of electric energy with 850,000 horsepower of hydro installation. Now, everything above 236,000 horsepower-years is secondary. It can not be made primary even by the steam without adding to the existing installation.

The CHAIRMAN. Now, how much—

Mr. MERRILL. That would be 224,000 horsepower years of secondary power. The average daily output with 850,000 horsepower of hydro installation and 130,000 horsepower of steam installation, operating on a 60 per cent load factor, would vary from a minimum daily average of 236,000 horsepower to a maximum daily average of 510,000 horsepower. For some 64 per cent of the time the 510,000 horsepower would have been available; for the remaining 36 per cent, a less amount. This secondary power of 510,000 less 236,000, or 274,000, which would have been available 64 per cent of the time during the 26 years of record would have produced an average annual output of 224,000 horsepower years.

Senator McKINLEY. That would be eight months.

- Mr. MERRILL. Nearly eight months, and that would mean an output, assuming that there is enough storage at the dams to regulate day by day the variations during the day, of about three billion kilowatt hours. If you can not use the pondage (which is the term ordinarily employed to designate storage used for daily regulation) to regulate for the daily load factor so as to use completely the water that is flowing by on any particular day, then these three billion kilowatt hours must be reduced accordingly. If you could regulate to only 80 per cent of use of the daily water supply you could get 2,400,000,000 kilowatt hours; if you could regulate to only 60 per cent, you would get less than two billion; so it is of extreme importance, from the power development standpoint at Muscle Shoals, to be able to vary the discharge during the 24 hours in order to make the amount available during any 24 hours fit the load factor of that period.

I presume this can be done without any difficulty at all in times of high water. The question is whether, at the low stages, when a regular discharge needs to be maintained for navigation, the water will not have to run by continuously. If it does, that will reduce somewhat the amount of power that can be gotten out of the streams at times of low water, with load factors less than 100 per cent.

There are three methods by which you can correct a situation such as you find in the Tennessee River of a variable river discharge. Two are by means of storage and one by means of stand-by steam. The two storage methods are storage on the river itself and storage elsewhere. If you store the waters on the Tennessee itself, you will raise the low water flow, increase the power, and reduce the amount of installation that you have to have to produce a certain amount of power. If you put storage on another stream, such as is proposed on the Tallapoosa, for example, you will get the same result in kilowatt hours, but you will have to have more kilowatts of installation to do it.

Senator HEFLIN. You mean you will have to build more dams?

Mr. MERRILL. You will have to use more dams and you will have to put in more generating capacity, because you will have to use the power plant located at the storage dam as a peak load plant, running it with water from storage, while the water is low on the Tennessee. Because you would be running both plants, the Tennessee River plant and the Tallapoosa plant, on a variable seasonal load factor, such an

arrangement would mean a much greater installation than if both the storage and the power plants were located on the Tennessee River itself.

The CHAIRMAN. When you speak of the Tennessee, you mean——

Mr. MERRILL. The Tennessee and its tributaries.

The CHAIRMAN. The Tennessee and its tributaries, but not the Tallapoosa?

Mr. MERRILL. That is in another watershed altogether. Whether the one or the other plan should be followed is largely a question of dollars and cents. From an operating standpoint, there is no material difference. In one case, you will control the water and develop the energy at one point, and in the other case you will control the water at two points and switch the energy back and forth over a transmission line. It is purely an economic question. The third method is to put in steam installation. That method is now generally employed. Nearly all hydroelectric operations are dependent to a certain degree upon auxiliary steam. The only one that I know of, of any magnitude, that does not require steam auxiliaries is Niagara.

Senator McKINLEY. Well, the minute you do that, though, Mr. Merrill, you are increasing your cost very considerably?

Mr. MERRILL. You are increasing your capital investment.

Senator McKINLEY. Well, your interest charge, of course, but you are increasing the cost of your power very considerably?

Mr. MERRILL. Yes. It is again a question of dollars and cents as to the cheapest method of getting the number of kilowatt hours you want.

I have a chart here, Mr. Chairman, which shows for the two dams under consideration the amount of power available for certain percentages of the time. The percentages are shown at the top and the quantities here [indicating on chart]. The 12-month average power that you will get out of the river for any given maximum is also shown, but for hydraulic alone and for hydraulic and steam combined. I will be glad to put these into the record if they will be of any value to you.

The CHAIRMAN. All right; we will be glad to have them.

(The charts referred to by Mr. Merrill are on file with the clerk to the committee.)

Mr. MERRILL. I have also three tables here, the first of which shows for periods from 12 months to 6 months the amount of power available by the combination of steam and hydro. The second shows the amounts available from hydro only over the same intervals, giving Dams Nos. 2 and 3 separately. The third shows the same data for varying quantities at 100,000 horsepower intervals, and in percentages of time. I believe there is no difference between these figures and the ones that Colonel Barden introduced, other than would naturally come from the use of different efficiency factors and from the use of a somewhat different period of record.

The CHAIRMAN. Colonel Barden's testimony, as I remember it, showed that at Dam No. 2 the primary horsepower was 87,300.

Mr. MERRILL. Yes.

The CHAIRMAN. Now, that primary power was available 99½ per cent of the time.

Mr. MERRILL. Yes. What we have taken here is shown as the absolute minimum of the amount that is available in the actual lowest day.

The CHAIRMAN. Yes.

Power available at Muscle Shoals, with 95-foot¹ head at Dam No. 2, 40-foot¹ head at Dam No. 3, and a steam installation of 130,000 horsepower.

TABLE NO. I.

Period.	Maximum horsepower available hydro and steam combined for certain periods and percentages.		Horsepower-years per year available for such maxima.			Increase in horsepower-years for several steps.
	Per cent of time.	Horsepower.	Horsepower years.	Per cent hydro.	Per cent steam.	
12 months.....	100	236,000	236,000	97	3	72,000
11 months.....	92	310,000	308,000	93	7	47,000
10 months.....	83	363,000	355,000	90	10	46,000
9 months.....	75	420,000	401,000	89	11	46,000
8 months.....	67	487,000	447,000	88	12	45,000
7 months.....	58	558,000	492,000	87	13	50,000
6 months.....	50	658,000	542,000	87	13	

¹ These are maximum heads. For variation in head, reference is made to Army Engineers Report, House Document No. 1262, Sixty-fourth Congress, first session.

NOTE.—In Tables I, II, and III all figures, except for 100 per cent of time, are based on average monthly discharges of Tennessee River at Florence, Ala., and all on basis of 90 per cent efficiency to switchboard, and, since adequate pondage is available, upon 100 per cent load factor.

Power available at Muscle Shoals, with 95-foot head at Dam No. 2, 40-foot head at Dam No. 3, and a steam installation of 130,000 horsepower—Continued.

39.....	700,000	494,000	203,000	490,000	343,000	147,000	

Mr. MERRILL. It is only a mere figure; that is all. It would not serve as the limit of any power development. There are only a few days in the 26 years of record when the water approaches that minimum point.

I believe that is all I care to say on that particular point, Mr. Chairman, unless you have some questions.

Mr. CHAIRMAN. I was going to ask you about your load factor. You have taken that at 60 per cent?

Mr. MERRILL. Yes, sir.

The CHAIRMAN. That is the accepted formula, is it?

Mr. MERRILL. It depends, of course, upon the circumstances. I believe Colonel Keller, in his investigations in the South, found a load a load factor of around 55 per cent. It varies considerably throughout the country.

The CHAIRMAN. That depends upon the use that you are putting it to.

Mr. MERRILL. It does; entirely so.

The CHAIRMAN. If it should be found, for instance, in operating nitrate plant No. 2 that it could be operated by secondary power, and the plant stand idle for two months in the year, I think some of the witnesses have shown that there would be enough secondary power to operate the plant for 10 months in the year, and they would use that power which, to a great extent, would otherwise be unused.

Mr. MERRILL. Except as supplemented by steam.

The CHAIRMAN. Yes.

Mr. MERRILL. And, of course, that nitrate plant can take the secondary power when available and have the deficiencies made up with steam. It is an advantage, of course, whenever conditions will permit, to have the demand for power correspond to the run of the river.

The CHAIRMAN. Now, Mr. Merrill, I wish you would give us, if you have studied this phase of it, your judgment as to the value of that power, if you were going to sell it?

Mr. MERRILL. You mean of the power available there at Muscle Shoals?

The CHAIRMAN. Yes.

Mr. MERRILL. Let me add this further statement, first, if I may:

The Alabama Power Co. proposes to turn over for the use of the nitrate plants the second hundred thousand horsepower available at Muscle Shoals, at Dam No. 2. Our figures show that you can get the full 100,000 horsepower during that 26 years of record, 77 per cent of the time, and that the average annual amount of energy that you will be able to get for the whole time is 82,000 horsepower years. That is, 82 per cent of the 100,000 is available during that period of 26 years. This is, as I recall, the same figure that was stated by the engineers of the Alabama Power Co.

If you will look at the first chart you will see that it is made up for both dams. The line on here for 140,000 horsepower means 100,000 horsepower at Dam No. 2, and 40,000 horsepower at Dam No. 3. That line is broken only once in the whole 26 years of record, and that was in 1904. This means that once and only once in the 26 years of record has the average monthly power available at Dam No. 2 fallen below 100,000 horsepower.

The CHAIRMAN. Let us see about that. Where do you get the years there?

Mr. MERRILL. The years are shown at the bottom of each section of the chart.

The CHAIRMAN. Yes.

Mr. MERRILL. That deep gap in 1904, shown in the dark green across the 140,000-horsepower line, means that for a two months period there, from the records we have, there would have been less than 100,000 horsepower available at Dam No. 2, so that there would have been no part of the second 100,000 available for that period.

I should explain that this chart is made up on the monthly averages. It does not show daily fluctuations, but it does show the averages per month; so that on the average for two months in 1904, if the water records for that year are correct, there would have been no water power available for the nitrate operations if they were dependent upon the second hundred thousand.

The CHAIRMAN. Mr. Merrill, Mr. Ford's offer, wherein he gives the Government the second 100,000 horsepower—

Mr. MERRILL. You mean the Alabama Power Co.'s offer.

The CHAIRMAN. Yes, I mean the Alabama Power Co. I said Mr. Ford's offer. I meant the offer of the Alabama Power Co.

Mr. MERRILL. Yes.

The CHAIRMAN. That would mean that there would be about two months, on the average, that we would not have the complete 100,000?

Mr. MERRILL. That means that in that particular year for two months, two consecutive months, there was no power at all available, none of the second 100,000 available.

The CHAIRMAN. Yes.

Mr. MERRILL. In the 312 months of the 26 years there are 70 months when all of the second 100,000 horsepower is not available.

Senator NORBECK. That makes what percentage?

Mr. MERRILL. There are 70 months in the 26 years, as shown on the chart when all of the second hundred thousand horsepower is not available. Some portion of it will be except for two months in 1904.

The CHAIRMAN. In that 26 years there was only one year when it lacked as much as two months?

Mr. MERRILL. Except for that year there was not any month in which there was not some of the second hundred thousand available.

The CHAIRMAN. Yes.

Mr. MERRILL. In those two months there was none available, that is, on the basis of monthly averages. There may have been certain days in the two months when there would be some.

The CHAIRMAN. Yes.

Mr. MERRILL. And there may have been days in other adjacent months. We worked on the monthly average basis, and we found two months in 1904 when there would have been no power available for the nitrate operations.

Senator NORBECK. But there were 70 months in which it was?

Mr. MERRILL. Seventy months when all of the second 100,000 was not available.

Senator HEFLIN. In 26 years?

Mr. MERRILL. In 26 years.

Senator NORBECK. For 20 or 25 per cent of the time, then, you were short on power?

Mr. MERRILL. For 22½ per cent of the time you would not have had the full supply, but the average supply for the 26 years from the second 100,000 horsepower would have been 82,000 horsepower years.

Senator MCKINLEY. So their offer, then, is really only 82,000 horsepower instead of 100,000 horsepower.

The CHAIRMAN. Yes; I think that is plain. Now, I wish you would take up the question that I asked you a while ago, as to what this is worth down there, what its value is.

Mr. MERRILL. An answer to that, of course, would be only an opinion.

The CHAIRMAN. Yes; I realize that.

Mr. MERRILL. And would depend in some degree upon the amount available. I understand that the Alabama Power Co. presented evidence to your body showing that at the present time it is selling a considerable amount of power in large blocks at from 6 to 6½ mills per kilowatt hour. That is delivered, of course. If you build transmission lines from Muscle Shoals out to the surrounding country to deliver power you will, of course, add to your investment cost. I would think it would be safe, at least, to count on 4 to 5 mills per kilowatt hour as the wholesale price for any power delivered at Muscle Shoals.

Senator MCKINLEY. That would be \$24 a year—4 mills?

Mr. MERRILL. Four mills is just a little over that.

The CHAIRMAN. Will you compute that for us? How much would we get if we sold the power developed there?

Mr. MERRILL. With 850,000 horsepower in installation, with the 130,000 horsepower steam stand-by, and on the assumption—and I wish you to notice the assumption—that you can regulate the daily fluctuations in water at both dams by the pondage behind them, you get approximately 3,000,000,000 kilowatt-hours.

The CHAIRMAN. Per year?

Mr. MERRILL. Per year.

The CHAIRMAN. To get the money that we sold it for at 4 mills, it would be four times three billion per year, would it?

Mr. MERRILL. That would be the gross proceeds, but I probably ought to qualify that by saying that a considerable portion of that is secondary. You could not expect to get the full amount on secondary power.

The CHAIRMAN. That is what I was going to ask you.

Mr. MERRILL. Yes.

The CHAIRMAN. A part of it is secondary?

Mr. MERRILL. Yes.

The CHAIRMAN. Take the primary horsepower now. How much per year would we get for that?

Mr. MERRILL. I was thinking of primary horsepower when I spoke about the price. A little over half of that total would be primary power, with the steam, and the balance would be secondary power, varying from 6 months to 12 months, of course.

The CHAIRMAN. Now, how much money would we get for the primary horsepower?

Mr. MERRILL. Suppose we say, just for the sake of seeing what it would come to, that we have 1,500,000,000 primary kilowatt-hours at 4 mills—

The CHAIRMAN. Yes.

Mr. MERRILL. And that we have one had a half billion secondary at an average, say, of 1½ mills.

The CHAIRMAN. Yes.

Mr. MERRILL. That is \$8,250,000, is it not?

Major BURNS. That is correct.

The CHAIRMAN. How much?

Major BURNS. \$8,250,000.

The CHAIRMAN. Eight and a quarter million dollars?

Major BURNS. Yes sir; \$8,250,000 a year.

The CHAIRMAN. \$8,250,000 a year; yes.

Mr. MERRILL. I think those are conservative figures.

The CHAIRMAN. Could you give us an estimate of what it would cost to operate it and keep it in good condition?

Mr. MERRILL. It would require a pretty long guess on that, too, of course.

The CHAIRMAN. Yes; I know that is only an estimate. We can not expect to get it accurately; but I am trying to reach, if I can, a computation as to the net yearly income that we could get out of the property if we were going to put it on the market and sell it.

Mr. MERRILL. I did have some figures along that line.

Senator HEFLIN. I believe you state, Mr. Merrill—

The CHAIRMAN. Let him finish that, Senator. He is going to figure that out for us.

Senator HEFLIN. Yes.

Mr. MERRILL. The first cost you will have is your interest cost. I can tell you approximately what that will be.

Senator MCKINLEY. Well, that is a \$60,000,000 investment, is it not?

Mr. MERRILL. It is likely to be more than that, Senator. It is approximately a \$70,000,000 investment down there in the two dams, if we adopt the estimate of the Army engineers, of \$25,000,000 to complete Dam No. 2.

The CHAIRMAN. It would hardly be fair to take that as the cost of those, because they were constructed during the war.

Senator McKINLEY. Oh, no; this is the new work, mostly.

Mr. MERRILL. A large part of this is new construction. There was \$17,000,000 of old investment in there; I mean the existing investment in there.

The CHAIRMAN. Yes; about \$17,000,000.

Mr. MERRILL. The estimate is \$50,000,000 for the new construction, besides some \$2,300,000 for flowage rights. The figure there is \$69,092,000. That is the total cost, not including interest during construction.

The CHAIRMAN. Oh, no.

Mr. MERRILL. If we take \$70,000,000 as round figures, the interest on that per annum at 4 per cent is \$2,800,000.

Your next item will be operating expenses. Colonel Cooper, when he testified before the House committee, estimated \$1 per horsepower of installation for operating expenses. If that is so, and it appears to be approximately correct from certain estimates I have made on another basis, that is \$850,000 for operation. You have, in addition to that the reserve for depreciation. Now, the plant down there, and particularly the mechanical equipment, is going to wear out, and when it wears out it has to be replaced. There may be major repairs upon the dam, due to floods. That is a casualty that ought to be taken into consideration. I have assumed that there will be a 4 per cent depreciation and retirement charge on the mechanical equipment, taken as \$20,000,000 (\$17,000,000 for the 850,000 horsepower installation at \$20 a horsepower, and \$3,000,000 added for the gate-operating mechanism, and the big gates along the crest of the dam). On that basis, we would have \$300,000 additional for depreciation charges on the mechanical equipment. There is left a balance, then, of \$50,000,000, comprising the heavy construction, like the dam, the locks, the power house, and such as that, on which I have taken one-half of 1 per cent, which would mean \$250,000 a year.

Senator NORBECK. That is, assuming that it will neither play out nor go out of style in 200 years, is it not?

Mr. MERRILL. It ought to stay there 200 years. Of course, if it is subject to accident, the estimate is incorrect.

Senator NORBECK. But the probability is that it will last 200 years without change?

Mr. MERRILL. Yes; on the average, without anything more than current maintenance. The total is \$4,700,000.

Senator NORBECK. To operate it.

Mr. MERRILL. Interest, operating expense, and depreciation.

Senator HEFLIN. And you could sell the horsepower for how much?

Senator NORBECK. You have not anything for fuel in the steam operation there?

Mr. MERRILL. No; this is hydro alone.

The CHAIRMAN. He does not have the steam.

Senator McKINLEY. You have that in your steam cost; you figured it?

The CHAIRMAN. No.

Mr. MERRILL. No; it is not in there yet.

The CHAIRMAN. No.

Senator McKINLEY. You would have to add it?

The CHAIRMAN. Yes; but when you added it you, of course, would add that much more to your income, because you are making primary out of it.

Senator HEFLIN. Do not forget to answer my question as to how much you get for the horsepower produced at Dam No. 1 and Dam No. 2 and Dam No. 3?

The CHAIRMAN. There is not any produced at Dam No. 1, Senator. You do not want that question to stand.

Mr. MERRILL. I have some rough figures here, Mr. Chairman, on the cost of operating the steam plant, using Colonel Barden's primary data, and assuming that the plant is operating six months of the year, which would be about \$2,500,000 operating expense, including interest and depreciation on the steam plant, which would be \$7,200,000 total expense, as against \$8,250,000 total revenue, or about \$1,000,000 balance. These figures, of course, I have not taken from any close examination of operating expenses elsewhere, or any close examination of the exact situation at Muscle Shoals.

The CHAIRMAN. These figures include water and steam, both?

Mr. MERRILL. Water and steam, both.

The CHAIRMAN. And 4 per cent on the investment?

Mr. MERRILL. On the investment in both.

Senator HEFLIN. What did you say in response to my question? I was called to the phone for a moment, Mr. Chairman.

The CHAIRMAN. Ask your question again, Senator. You do not want it to stand as you put it before, because Dam No. 1 is not a power dam at all.

Senator HEFLIN. That is for navigation purposes. Dams 2 and 3; those are the dams I had in mind.

Mr. MERRILL. Dams 2 and 3?

Senator HEFLIN. What do you think the Government can get for the power produced at those two dams, per annum?

Mr. MERRILL. I said that with an installation of 850,000 horsepower, and with the ability to use the water at the two dams for daily regulation, they should get approximately 3,000,000,000 kilowatt hours. Assuming one-half of that would be primary power, which could be sold for 4 mills per kilowatt hour, and one-half secondary at 1½ mills per kilowatt hour, the total receipts would be \$8,250,000. We have made some rough estimates here of operating expense, interest, and depreciation on both the hydro and steam plant totaling \$7,200,000, or approximately \$1,000,000 less.

The CHAIRMAN. Now, let us get the figures as to the horsepower. The primary would be how many horsepower?

Mr. MERRILL. About 236,000 horsepower years, primary.

The CHAIRMAN. And the same secondary?

Mr. MERRILL. The secondary is a little less than that because the total is 460,000 horsepower years.

The CHAIRMAN. Yes.

Mr. MERRILL. It is 224,000 horsepower years secondary.

Senator McKINLEY. Mr. Merrill, would you mind analyzing a little more in detail that \$2,500,000 which you say it will cost to operate the steam plant? How many days or months of the year would you have to be burning coal to operate it? Have you figured that?

Mr. MERRILL. You would have to be burning some coal, according to this record, on the average nearly one-half of the time.

Senator McKINLEY. That would be—

Mr. MERRILL. One hundred and forty-nine months out of the 26 years, or 47.7 per cent.

Senator McKINLEY. That would be approximately one-half of the time?

Mr. MERRILL. Yes; approximately one-half of the time, but of course not all this time at full capacity. The proportion of steam power would be about one-eighth of the total.

Senator McKINLEY. Yes.

Mr. MERRILL. I have certain figures here prepared on the assumption that the steam plant is operating six months in the year. I have used Colonel Barden's figures of \$172,800 per month for fuel for a steam plant of 80,000 horsepower capacity. I have taken as 130,000 horsepower the combined steam capacity in the Gorgas plant, and at Nitrate No. 1 and No. 2. Increasing Colonel Barden's figures in like ratio means \$281,000 per month for fuel at full operation. These figures that I have just given you include six months full operation of the steam plant, which is considerably more than is necessary. They, however, include interest on only \$5,000,000.

Senator McKINLEY. But there is \$10,000,000 invested?

Mr. MERRILL. Approximately \$10,000,000. The interest on \$5,000,000 is taken at 6 per cent, so that will offset to some extent the probable overcharge for the fuel, and I have estimated \$15,000 per month for labor for 12 months in the year, or \$180,000 total.

The CHAIRMAN. Would you keep your organization running the whole year, but only use it for six months?

Mr. MERRILL. A part of the organization has to be there. The reason I use that is that Colonel Barden gives \$15,000 per month for the 80,000 horsepower installation for a period of three months plus \$30,000 for the remainder of the year, or \$75,000 per annum. I have used \$180,000 per annum for a 130,000 horsepower installation operating six months of the year. The figures, of course, are only rough approximations.

The CHAIRMAN. In these figures that you have given us, do you include the Gorgas?

Mr. MERRILL. The Gorgas is in there; yes.

The CHAIRMAN. It is in there?

Mr. MERRILL. Yes.

The CHAIRMAN. If we omit the Gorgas plant—

Mr. MERRILL. You will reduce the 130,000 by about 40,000 horsepower.

The CHAIRMAN. I do not know that that makes much difference. If we omit the Gorgas, that means that we would reduce the invested capital so much also?

Mr. MERRILL. Yes, sir; and if the steam is desirable, the additional unit of 30,000 kilowatts (40,000 horsepower) that was originally proposed for No. 2 should be put in. I understand the boilers are already there.

The CHAIRMAN. Yes; that should be increased.

Mr. MERRILL. Of course, you understand, Mr. Chairman, that I have not attempted to get down to any figures that I can be certain of. They are merely illustrative figures, approximate figures of what you might expect. It happens that these figures were worked out roughly in connection with a study of Mr. Ford's offer, and the \$5,000,000 that I have used for the steam plants is the \$5,000,000 which he proposed to pay, and not an assumption of the actual value of the plant.

Mr. Chairman, you have asked several times, I have noticed in the record, about the sale of power at Niagara. Did you get that information?

The CHAIRMAN. About what?

Mr. MERRILL. The sale of power at Niagara. Have you got the information you wished?

The CHAIRMAN. No, sir; I have not. Can you give us any information on that?

Mr. MERRILL. I can give you some information about it.

The CHAIRMAN. I wish you would.

Mr. MERRILL. Power in the city of Buffalo is distributed by the Buffalo General Electric Co. That company has a steam plant in the city of Buffalo of 130,000 horsepower capacity, I believe. It has purchased for a number of years under contract from the Niagara Falls Power Co. 37,500 horsepower per annum. That is what is known as firm power. It is supposed to be 100 per cent load factor power. Their output of the Buffalo General Electric Co. in the year 1921 was 470,000,000 kilowatt hours. That is equivalent to 72,000 horsepower years, which means that of the amount of power they have to distribute two-thirds is steam and one-third is hydro. The Niagara Falls Power Co. sells the hydro power to the Buffalo General Electric Co. at \$16 per horsepower per annum.

The CHAIRMAN. That would be how much per kilowatt hour?

Mr. MERRILL. 2½ mills per kilowatt hour if the load factor is 100 per cent.

The CHAIRMAN. Yes.

Mr. MERRILL. The maximum rate in the city of Buffalo for domestic service is 8 cents per kilowatt hour, with one cent per kilowatt hour discount for prompt payment. That means 7 cents per kilowatt hour.

Senator McKINLEY. You had better explain, perhaps, that to make that 100 per cent load factor, that they paid 2½ mills for, it probably costs them 5 mills to—

Mr. MERRILL. No; I think the Buffalo General Electric Co. takes it on 100 per cent load factor itself. It would naturally do so, because it has no hydro of its own. It would take it 24 hours in the day, just as it comes, and supply the balance of its requirements from its steam plant.

Senator McKINLEY. You mean by that that instead of having 37,000 demand it perhaps has a 50,000 or 60,000 demand?

Mr. MERRILL. They no doubt have a greater minimum demand than the 37,500 horsepower of hydro which they purchase.

Senator McKINLEY. Yes.

Mr. MERRILL. Than this firm power, so called.

The CHAIRMAN. What does their steam cost them?

Mr. MERRILL. I can not tell you what it costs there. I have certain figures here of steam power costs.

The CHAIRMAN. Have you got the figures for the city of Cleveland?

Mr. MERRILL. I do not believe so. I can give you the figures on rates.

The CHAIRMAN. In Cleveland?

Mr. MERRILL. I think so.

The CHAIRMAN. The city of Cleveland is supplied by two companies, one owned by the city and one privately owned.

Senator McKINLEY. That would not serve any purposes for the United States, because Cleveland has every advantage on water and coal.

The CHAIRMAN. Yes; but it is all generated with coal. There is no water power.

Senator McKINLEY. But they can generate cheaper than almost anybody else.

The CHAIRMAN. Yes; they get very cheap coal, but I should say their coal would not be as cheap as at Gorgas, where there is no transportation at all.

Senator McKINLEY. Oh, no.

The CHAIRMAN. Where it is taken right out of the mine?

Senator HEFLIN. Yes; Gorgas is right in the heart of the coal region in that section.

The CHAIRMAN. Yes; no steam power could compete with that.

Mr. MERRILL. This says that the Cleveland Electric Illuminating Co. has a straight line meter rate of 5 cents per kilowatt hour.

Senator McKINLEY. That is 50 mills. That does not mean anything.

The CHAIRMAN. Well, can you give us the other rate in Cleveland—the rate of the municipal company?

Mr. MERRILL. I do not think that is given here. Presumably that is a pretty low rate.

Senator McKINLEY. They are undoubtedly selling power at 11 or 12 mills instead of 50 mills.

The CHAIRMAN. The rate of this private company there, undoubtedly, in my judgment—

Senator McKINLEY. I say the Cleveland company is undoubtedly selling power at 11 or 12 mills.

Mr. MERRILL. The rate that I quoted is only for domestic household service.

Senator McKINLEY. That has nothing to do with your question, Mr. Chairman.

Mr. MERRILL. There are rates quoted in here down as low as 11 mills, I see.

The CHAIRMAN. Is there any uniformity, so that you could come anywhere near establishing the general rule as to the cost of distribution of electric power in cities?

Mr. MERRILL. I do not think so, Mr. Chairman. There is likely to be a wide variation, according to the character of construction, according to the volume of power handled, and to the management.

The CHAIRMAN. Well, take a large city. What I mean is, after the power is generated and brought to the city and then distributed from the central stations, as a rule, does it cost more to distribute it after the city gets it than it does to produce it and deliver it to the city?

Mr. MERRILL. Yes; I think it does cost considerably more.

The CHAIRMAN. If you were so have delivered to an ordinary city at its distributing station, electricity for 2½ cents per kilowatt hour, say, it would cost more than 2½ cents to distribute it?

Mr. MERRILL. I think it would probably cost more than twice that.

The CHAIRMAN. To distribute it?

Mr. MERRILL. Yes. You see, there is a huge investment in distribution systems in proportion to the amount of power carried over them. I believe it was Mr. Griffith of the Portland Railway, Light & Power Co., who told me a few days ago that only 7 per cent of the power they generate in their system is sold for domestic use. It is a very small proportion. It carries a very heavy investment charge. It carries the lines; it carries the meters, and the office expenses in connection with the collection and billing are a hundred times greater than they are for power.

The CHAIRMAN. Yes.

Mr. MERRILL. And all of these items together make the cost of distribution after the power is received in the station in the city much greater than its generation and delivery to that point.

Senator McKINLEY. Mr. Chairman, right in that connection, in most places, except these very large cities, they use what is called alternating current, and that is transformed in transformers. If it is a large transformer it is out on the street, on the pole that you see, and then it is taken off by a dozen small customers from there.

The CHAIRMAN. Yes.

Senator McKINLEY. In the evening, when they are all using it once, in a large amount, the transforming loss is small, maybe 30 per cent, but at other times, when just a few people are using it off of that transformer, the loss might be 50 or 60 per cent. Those things—

The CHAIRMAN. They are all a part of the distribution system.

Senator McKINLEY. Yes; they all make up a part of the cost of the power.

The CHAIRMAN. After all, it seems to me that the whole thing is to wait for some ingenious Yankee to invent practical storage power.

Mr. MERRILL. That would make a very great difference.

The CHAIRMAN. So that you can take your electricity and put it in your basement, like you do your coal now.

Mr. MERRILL. In the State of California there is very close regulation of great public utilities and the rate regulation is on the basis of the cost of service per classes of service. The rate, as I recall it, for domestic service in San Francisco is 7 cents per kilowatt-hour. That is furnished by the Pacific Gas & Electric Co. Their average receipts, as I recall, are under 1 cent per kilowatt-hour.

The CHAIRMAN. What is the total amount?

Mr. MERRILL. Of the total amount sold for all purposes, and they are selling power in blocks for street railway corporations at under 6 mills, I think. That power used for railroad corporations in the city of San Francisco comes into the same substation as the power that is distributed for domestic use, but the rate for one is more than 10 times as great as for the other.

The CHAIRMAN. Yes.

Mr. MERRILL. And that is the rate fixed by public authority on the basis of the cost of service by classes of service.

The CHAIRMAN. You are not a chemist, Mr. Merrill, are you?

Mr. MERRILL. No, sir; I am not a chemist, Mr. Chairman.

The CHAIRMAN. You can not give us any information with regard to these nitrate plants?

Mr. MERRILL. It would be of no value, because I would only be repeating what I have heard somebody else say.

The CHAIRMAN. Do you think of anything else, Mr. Merrill?

Senator HEFLIN. You have not expressed any opinion about the bids?

Mr. MERRILL. No: I want to speak a little, if you are through with this angle, on the financial relation of these bids.

The CHAIRMAN. All right, we would be very glad to hear you on that.

Mr. MERRILL. Let me put it in this way: Mr. Ford will pay \$5,000,000 in cash for steam stations that are probably worth eight or nine million, for 130,000 horsepower of steam at three steam stations. In addition, the United States is to give him, for nothing, two nitrate plants, the Waco quarry, and the railroad, and a million or two dollars of construction equipment and supplies. There is \$17,000,000, approximately, invested in Dam No. 2 at the present time by the Government.

It is proposed that the United States develop, and develop at once, Dam No. 2 and Dam No. 3, or develop them in series, one immediately after the other, at an amount estimated by the Army engineers at \$25,000,000 for each dam.

It is proposed that the United States shall itself pay the cost of the flowage rights at Dam No. 3, which I believe the Army engineers estimate at about \$2,300,000. That is his proposal, which, as far as I know, has not been changed.

It is proposed that the United States assume the liability for any damage suits that might be instituted by the Alabama Power Co. or the Air Nitrates Corporation on account of turning over property on which they claim an option.

The CHAIRMAN. I think, as far as the Alabama Power Co. is concerned, that has been modified, Mr. Merrill, in that he only gets the Government's interest in it.

Mr. MERRILL. He will himself assume liability there?

The CHAIRMAN. Yes.

Mr. MERRILL. Now, I have on that basis, made some computations of what the financial situation would be.

I was interested to find out for my own information at first just what liabilities Henry Ford will assume from a financial standpoint under his offer, and what liabilities the United States would be required to assume, and I have worked out here quite an extended computation of the interest and the amortization charges on these various properties under the various terms of the offer.

In making these computations I have taken the investment as already made to date as \$16,250,000 as reported by the Secretary of War on February 1, 1922; and have assumed that the remaining liabilities which are unsatisfied at that date, would be paid during the ensuing year. I have assumed certain dates for the completion of the plant—those dates being the ones at which the Chief of Engineers states the properties can be completed, and also that Dam No. 3 is started and completed immediately after Dam No. 2. I have taken the interest during construction at 4½ per cent; for the United States is paying that much now, or approximately that much, on its Liberty bonds. I have assumed, however, that after the plants are completed, which will be in 1925, for Dam No. 2, and in 1928 for Dam No. 3, that the interest which the United States pays will be 4 per cent. I have made these estimates on two different general assumptions. One assumption is that interest during construction is not added as part of the investment cost, and the second, that it is.

Now, under the first general assumption, the interest which the United States would receive from Henry Ford under his offer for Dam No. 2 would be \$95,200,000 in the hundred years. At Dam No. 3 it would be \$97,480,000, or a total of \$192,680,000.

The United States, on the assumptions that I have made, of 4½ per cent interest during construction and 4 per cent thereafter, would itself pay out during that same period from the United States Treasury, \$282,810,000 or \$90,130,000, more than Henry Ford pays in.

There is a proposal in the offer of Mr. Ford of an amortization charge of approximately \$23,000 semiannually, made on the supposition that if he pays those amounts semiannually he will have, at the date of the termination of his lease period, amortized the entire cost of these properties.

I think this can be said of the amortization proposal: It is good, but only good if the United States goes into the money-lending business, because the fund can accumulate its interest only if the United States takes these payments every six months as they come, and finds somebody who will bank them—either a bank or a trust company, or an insurance company—and pay 4 per cent interest compounded semiannually for 100 years and then turn it back, principal and interest. If they do that the amount, at the end of 100 years, will be \$48,000,000, or close to that. The balance of some \$10,000,000 to \$20,000,000 of the cost will remain unamortized. As a matter

of fact, the total amount paid in during the 100 years under the Ford proposal for the purpose of amortization on both dams will be only \$4,415,000, and the effect is in no sense different than if he paid that much rental charge for the property, or paid an interest charge that included that amount, or increased his operation payments by that amount.

If the United States is going into the money-lending business it had better go into it on a scale worth while, and instead of limiting its operations to the \$23,000 payment, take the entire payment, of some \$2,000,000 per annum, loan it out at 4 per cent compounded semiannually, and accumulate, as it would, some \$2,000,000,000 in the 100 years instead of a mere \$48,000,000. One proposition is just as reasonable as the other. If Mr. Ford established an amortization fund himself, paid into such fund the \$23,000 semiannually, assumed himself the responsibility for the semiannual interest payments upon the amounts in the fund, and at the end of the lease period turned over the fund with its interest accretions to the Government, amortization—to the extent of \$48,000,000—would be a fact and not a mere camouflage. Under his proposal Mr. Ford does not amortize the properties, or any part of them. He merely pays the Government \$4,415,000 during the lease period in semiannual amounts of approximately \$23,000, which is as useful, and no more so, for amortizing the Government's investment, as any other revenues from taxes or otherwise, paid into the United States Treasury.

The CHAIRMAN. Did you give the amount that we would actually take in under the amortization proposition?

Mr. MERRILL. \$4,415,000.

Senator HEFLIN. Four million?

Mr. MERRILL. \$4,415,000 in 100 years from both plants.

Senator HEFLIN. The Government would pay \$280,000,000?

Mr. MERRILL. Yes. \$282,810,000 for interest alone.

Senator KENDRICK. And Mr. Ford would pay in approximately \$180,000,000?

Mr. MERRILL. \$192,680,000, or \$90,130,000 less.

Senator MCKINLEY. Then the Government would be out \$90,000,000 on the Ford proposition?

Mr. MERRILL. On interest alone, in 100 years, or \$900,000 per annum.

Now, if the United States really wishes to amortize these properties on this four per cent sinking fund basis, compounded semi-annually, and get rid of the entire investment, it will not only have to go into the money lending business (or else pay the interest itself), but it will also have to put in itself semiannually an amount in addition to the sum which Mr. Ford proposes to pay. That is, if the Government actually intends to amortize the entire investment in the hydro plants, over the period of a hundred years, it will have to have a total of \$6,200,000 or about \$1,800,000 more than Mr. Ford proposes to pay, because Mr. Ford does not propose to amortize the entire investment in the property.

Therefore, on the assumption that interest during construction is not a part of the investment, the excess of items which the United States would be required to pay for interest and amortization, over what it received under the Ford offer, is \$92,000,000. If we proceed on the assumption that the amount of interest charges during construction is properly a part of the construction cost, as is done in every private undertaking, the deficiency then in the payments of Mr. Ford to make up what the United States would have to pay out of its own Treasury, is \$116,000,000 in the 100 years. That, you will understand, is on the basis that the United States pays 4½ per cent interest on borrowed money from the time the plants are started until the plants are finished, and that it pays 4 per cent thereafter during the lease period. I have the figures also on the assumption that it can borrow money for 3 per cent interest instead of 4. If we assume 3 per cent, the liabilities of the United States in excess of its receipts under the Ford offer would still be: If interest during construction is not included in cost, \$23,180,000 in the 100 years, and if interest during construction is charged into cost, \$39,423,000.

Senator HEFLIN. Your position is that Mr. Ford will not pay to the Government all together, from the time he takes charge of this to the expiration of the 100 years, over four million and some odd dollars in interest.

Mr. MERRILL. No; that is amortization only. Four million four hundred and fifteen thousand dollars for amortization. He will pay \$192,000,000 in interest.

Senator HEFLIN. How much will he have paid in in all at the end of a hundred years?

Mr. MERRILL. \$197,000,000.

Senator HEFLIN. That is nearly double the investment that the Government will make there?

Mr. MERRILL. It is nearly double the investment the Government would make, but the Government in the meantime will itself be required to pay out \$289,000,000

in interest and amortization charges if interest during construction is not charged into cost, and \$313,000,000 if it is. That is, the difference between what the Government pays out and what it takes in during the hundred years for both interest and amortization, under Ford's proposal, and assuming the Government can borrow at 4 per cent, is from \$92,000,000 to \$116,000,000.

There is one other way of approaching this question from the financial standpoint and that is to find out what is the present worth of the payments Mr. Ford will make from time to time during the life of his proposal and the present worth of the payments which the United States would be required to make from time to time for interest and other purposes.

I have computed the present worth on the basis of 4 per cent compound interest as of the date of July 1, 1922, and the result is that the payments made by the United States under the Ford proposal throughout the life of the lease would be worth, as of July 1, 1922, \$28,000,000 more than the payments made by Mr. Ford, this on the assumption that interest during construction is not charged in as a part of the capital. If interest is charged on construction as a part of capital, the amount is a few thousand dollars less than \$28,000,000.

The CHAIRMAN. You have always given two comparisons, one on the assumption that the interest is to be paid on construction charged from the time they are paid until it is completed and another one is that no interest is to be charged. Personally I do not understand why anybody would make a computation and figure no interest on these charges. Why isn't it just as legitimate for us now to pay interest on \$70,000,000 on the construction of Dam No. 2 as it is to wait until it is completed and pay the interest then?

Mr. MERRILL. The difference between the two methods is this: If interest is paid during construction, the question is whether it shall be considered as a cost of operation or a charge to capital. We have an investment of, say, \$70,000,000. The interest during the construction period is \$8,000,000. Now, shall we call the investment on which you are to pay interest thereafter \$78,000,000 or \$70,000,000? If you call it \$70,000,000, then you compute the interest thereafter on the \$70,000,000 and add the \$8,000,000 into your operating expenses. If you call it \$78,000,000, you have considered the \$8,000,000 as a part of the original cost, have added it to your capital, and thereafter pay interest upon it.

The CHAIRMAN. If the Government or a private party started to build a dam and was going to take five years to build it at a cost of \$20,000,000, and they spent \$4,000,000 a year on it, they would have to get the money and would have to pay interest on it all the time, as fast as it was used?

Mr. MERRILL. Yes.

The CHAIRMAN. And if they had the money and did not have to borrow it, they would be entitled to interest on it at whatever rate it would bear, if they loaned it to somebody. That would be the way to look at it so far as private parties are concerned.

Mr. MERRILL. And they add that interest during construction in as capital expenditure and not as operating expense.

The CHAIRMAN. Yes, why isn't that right?

Mr. MERRILL. It is right from a business standpoint, but a great many people, as you know, not only fail to add interest during construction into cost, when they are considering Government operation, but even ignore interest as a cost of operation. I suspect that many of the arguments which have been presented to you concerning Muscle Shoals have failed to include at any stage the interest obligations of the Government. It is no less a proper charge under Government than under private operation.

The CHAIRMAN. I should think so. In other words, if you and I were going to do anything of that kind that is what we would have to do whether we wanted to or not, and it would not be an answer to it, it seems to me, to say that you have this money already and don't have to borrow it, because we could loan it and get interest on it.

Mr. MERRILL. These last figures that I have given you, Mr. Chairman, mean this: If the United States had \$28,000,000 available on July 1, 1922, to put out at interest at 4 per cent per annum, that amount plus the interest received would be just enough to liquidate its recurrent liabilities in excess of its receipts from Mr. Ford. On the basis of present worth as of July 1, 1922, \$28,000,000 is the deficiency in Mr. Ford's proposal. If you figure it on the actual deficiency in dollars over the 100 years, it is from \$92,000,000 to \$116,000,000, as stated before.

There is one other method of approach to the question, and that is to determine values as of some future date. Testimony along such line was presented to the House committee. I would not take the time to discuss this basis of comparison had it not been presented before, and did it not, therefore, seem desirable to show its relation to the other bases of comparison which we have just been discussing. If we compute the "present worth" as of the date of expiration of the leases (assumed on July 1,

2025), of the several payments for interest and amortization, and the corresponding current liabilities of the United States for these same items, we will get the total to which the several annual and semiannual payments would amount if put at compound interest from the time when paid, or accrued, until the termination of the lease period. We would find by this process, with interest at 4 per cent, that the value as of July 1, 2025, of the liabilities of the United States under the Ford offer in excess of payments by Mr. Ford is somewhat more than \$1,700,000,000. This is the meaning of the figure. If that portion of the accruing charges for interest and amortization on the two hydro plants, which, under the Ford offer, would be paid by the United States instead of by Mr. Ford, were, instead of being so paid, put at 4 per cent compound interest and allowed to accumulate until July 1, 2025, the assumed end of the lease period, they would amount to \$1,700,000,000. Since, however, we have dealt with the same quantities in computing the present worth as of July 1, 1922, the value of \$1,700,000,000 on July 1, 2025, is the same as of \$28,000,000 payable on July 1, 1922; for the latter sum if put at compound interest at 4 per cent will be equal to the former on the former date. Whichever date and amount, therefore, is used, means simply this: The liabilities which the United States would assume under the Ford offer, in excess of the payments made by Mr. Ford, would for the two power plants alone be equivalent to a cash gift upon execution of the lease of \$28,000,000. This is in addition to the proposal that the steam plants be sold to him at about one-half their value, and that the two nitrate plants, with their accessories, costing something over \$70,000,000, be given to him outright. I have here the detailed computations if you care to have them.

The CHAIRMAN. Yes. I would like to have you give that to the reporter.

Mr. MERRILL. And I would like to have it go in as an appendix to the record. Preceding the detailed computations is a table summarizing the results under the various assumptions.

Senator HEFLIN. Mr. Merrill, Mr. Ford's chief engineer, Mr. Mayo, claims that he will produce fertilizer at Muscle Shoals, if he can get control of this cheap horsepower, at half the price the farmer now pays for it. The fertilizer bill, I believe, for the United States now, annually, is something over \$300,000,000. Mr. Theodore Swann, of Alabama, testified yesterday before the committee that he thought fertilizer could be produced at one-fourth of what it costs now. What is your idea about that, or do you know anything about that?

Mr. MERRILL. I do not know. What is the testimony you get from people who really know something about the manufacture of fertilizer?

Senator HEFLIN. Mr. Swann is a manufacturer himself.

The CHAIRMAN. I do not think he testified to that yesterday, that it could be manufactured at one-fourth the cost at the plant there.

Senator HEFLIN. Yes; I think he did.

The CHAIRMAN. I think he really stated that at plant No. 2 it was very doubtful whether you could make fertilizer at a price that would compete with the present prices of the market.

Senator HEFLIN. What is your recollection of his testimony, Major Burns?

Major BURNS. I think you are mistaken in that, Senator. I do not believe he made the statement that he could make fertilizer at one-fourth the cost, but he said he hoped that you might reduce the cost of fertilizer by the use of phosphoric acid; but he did not even come out flat-footedly and say that he could make ammonium phosphate at a less price than fertilizer is made at now.

Senator HEFLIN. My recollection is he said he could make it for one-fourth less.

Major BURNS. He said he could eliminate the use of sulphuric acid, which would have the effect of reducing the price of ammonia by one-fourth, that is quite correct; but he didn't say that even ammonium sulphate would be any cheaper than the present combination of ammonia and phosphoric acid.

Senator HEFLIN. That is my recollection of his testimony, and I asked the question because I had that in mind when I asked it.

Of course, we want to do, with these various water powers, the most good for the people. In leasing the water power at Muscle Shoals and the equipment at Muscle Shoals, we ought to have in mind the good that will be done for the people of the United States. As the thing stands to-day the farmers are absolutely at the mercy of the Fertilizer Trust; they have to pay whatever price the trust demands, and Mr. Ford proposes to make fertilizer at a price much cheaper than the price they now have to pay. I figure that if the fertilizer bill for the farmers of the United States is \$300,000,000 a year, that if we could take off one-sixth from that present price, that would be \$50,000,000 a year, and that amount, for a period of 100 years, would be a saving of \$5,000,000,000 to the farmers of the United States. Don't you think that would be a rather beneficial thing?

Mr. MERRILL. There is no doubt that it would be beneficial to reduce the cost of fertilizer. The question here is whether this proposal is the way to do it and whether in consideration of doing a good thing for a certain class of people Mr. Henry Ford should individually be subsidized to the degree that this proposal will subsidize him.

Senator HEFLIN. Do you think this power will be developed and utilized unless it is leased out to some private individual?

Mr. MERRILL. I personally think that the power can better be developed, either through construction by the Government of a plant and subsequent leasing of it, or by arrangements whereby private capital will furnish the money to construct it under a proper arrangement with the Government.

Senator HEFLIN. Now, the fertilizer people, the Fertilizer Trust and the power people, the various power concerns of the country, are fighting Mr. Ford's offer. They do not want him to get hold of Muscle Shoals. Don't you suppose that if Mr. Ford's offer is rejected and the Government goes ahead and develops the power there, and undertakes to utilize it, that these same people will say that the Government ought not to be in business in competition with them?

Mr. MERRILL. Perhaps so; they say that all the time.

Senator HEFLIN. And have they not many times prevented development by the Government because of that cry they have made and because of the power that they have been able to exercise in Congress?

Mr. MERRILL. Well, I personally agree with them that the Government should not be in business, unless it is forced into business.

Senator HEFLIN. Unless it is forced in?

Mr. MERRILL. Yes.

Senator HEFLIN. I do, too. I do not think the Government, as a rule, ought to go into business in competition with private enterprise; but here is an opportunity for the Government to lease this property down there, property which is now of no value to-day; the dam has not been completed, and navigation of the river is obstructed, and Mr. Ford offers to take it and offers to bind himself in a contract with the Government to produce fertilizers, and his engineer says that he thinks he has a secret process through which he can make fertilizer at half the cost the farmer is paying for it to-day.

Mr. MERRILL. If we are going to do that, assuming that it is a good thing to do that, why do it under such unconscionable terms?

Senator HEFLIN. He has made about the best offer, has he not?

Mr. MERRILL. I do not think so.

Senator HEFLIN. Whose offer is better than his?

Mr. MERRILL. I think from every practical standpoint that the offer of the Alabama Power Co. is more favorable to the United States than his. That matter I would like to discuss by itself. But we have this situation: It is proposed that the United States shall donate under this offer property for which it has paid over \$70,000,000; that it shall loan its credit to a private individual for \$50,000,000 at 4 per cent interest; that it shall give him the use of some \$20,000,000 more property for nothing, and that in addition it shall assume in his behalf liabilities of a cash value of \$28,000,000. In return for all this Mr. Ford promises, under his offer, that he will operate nitrate plant No. 2 up to its present capacity of 110,000 tons of ammonium nitrate per year—not in the production of fertilizers, but in the production of fertilizer compounds—and that is all he offers. Now, if he stops there—and I think in interpreting the contract you must assume that the parties to the contract will give no more than they offer to give under the written contract—you will, out of that 460,000 horsepower available at those two dams, have about 100,000 horsepower employed in the nitrate operations, and there will be left for Mr. Ford's use, his private use, 360,000 horsepower, of the cheapest power in the United States, not excepting Niagara—cheap to Mr. Ford for the simple reason that he pays only a part of the cost of that power and the rest of it is paid out of the United States Treasury.

Senator HEFLIN. As the matter now stands it is serving no purpose at all, you know.

Mr. MERRILL. That is quite right.

Senator HEFLIN. But if Mr. Ford takes it and Mr. Mayo's statement is correct, that he can make fertilizer for half the present cost, and if it should result in reducing the fertilizer cost to the farmers of the United States by half, and the supply should stay as it is now—although of course we know that it would be double and much more than double that in years to come—that would be a saving of about \$15,000,000 to the farmers of the United States in a hundred years' time.

Mr. MERRILL. There are a good many "ifs" in there and I do not know what value to give to the "ifs." I am not familiar with the chemical end of the processes.

The CHAIRMAN. And the "ifs" mean that, there isn't any agreement wherever those "ifs" come in.

Mr. MERRILL. Certainly not. It is only the obligation which Mr. Ford legally assumes that can be relied upon. He can be expected to carry out only the obligations which are written into the exact terms of the contract.

Senator HEFLIN. How much power do you think he will use in the manufacture of fertilizer?

Mr. MERRILL. He has guaranteed only to operate to the capacity of 110,000 tons of ammonium nitrate per annum, which takes 90,000 horsepower, approximately. I have used 100,000 in order to be perfectly safe.

Senator HEFLIN. That would leave him how much horsepower?

Mr. MERRILL. That will leave him 360,000 horsepower for his own uses.

Senator HEFLIN. At Dams 2 and 3?

Mr. MERRILL. At Dams 2 and 3, and steam plants, which would allow Mr. Ford—Senator HEFLIN. Did you figure the Gorgas plant in there?

Mr. MERRILL. I figured the Gorgas plant in there.

Senator HEFLIN. Suppose the Gorgas plant had not been figured in that?

Mr. MERRILL. It will reduce it about 30,000 horsepower.

Senator HEFLIN. Reduce it about 30,000 horsepower?

Mr. MERRILL. Yes; or 40,000.

The CHAIRMAN. If you eliminate the Gorgas plant, then you must assume that Mr. Ford sells it to the Alabama Power Co.

Mr. MERRILL. Yes, sir.

The CHAIRMAN. And that he will get money for it?

Mr. MERRILL. Yes, sir; and put it in his own pocket.

The CHAIRMAN. Of course, so that it would reduce, by whatever he got for it, the \$5,000,000 that he had to pay. I think it is conceded that he could get between two and three million dollars for it—for the Government's interest in the Gorgas plant—so in reality he would be paying only from two and a half to three million dollars, instead of five million.

Mr. MERRILL. Yes. We have so far been considering this offer strictly from the income and outgo standpoint, interest and amortization only. Now, let us consider it from another standpoint. There will be property down there with an investment value of approximately \$70,000,000 in addition to the two nitrate plants. Under the Ford offer the company will take care of the maintenance of the power houses and power-house equipment at the two dams and make the necessary replacements. It will pay \$55,000 per annum for the maintenance of the two dams, outside of the power-house section and the locks. I understand the Engineer Department thinks that \$55,000 is probably sufficient to pay the sheer operating expense of the locks. It does not take into account, however, in my judgment, maintenance and repair charges. There are along that dam, or I believe there will be when completed, a long series of steel gates. Are there not?

Major BURNS. There are; yes.

Mr. MERRILL. And those are going to be not only expensive to operate but expensive to repair. They are subject to injury at time of flood, or at overflow time. There is always a possibility in overflow time, on a big river like the Tennessee River, that you will get a scouring under the toe of the dam which will involve millions of dollars of expense. None of that is assumed by Mr. Ford in his offer. The United States must assume complete responsibility. There is nothing said in that contract about who has the responsibility or what would happen should, by flood or otherwise, a part of the power plant be wrecked, and in the absence of any stipulation, I assume it would be the Government's obligation to replace it.

Then there are other items that need to be taken into account. Property like a power plant depreciates, through mere expiration of life, beyond the point that it is taken up by ordinary repairs and replacements. A property like that, after operating for a period of 30 years, will have probably not to exceed 70 per cent of original value as far as mechanical equipment is concerned. Mr. Ford proposes to replace items of equipment as they go out. There is nothing in his proposal for taking care of the depreciation in service value which will have accrued on that property at the end of a hundred years, and when it comes back to the Government it will be returned as a property materially less in value than its original cost unless the United States, during the hundred years, sets up its own depreciation reserves.

Mr. Ford asks for a lease period of a hundred years. That matter, as you all know, was thoroughly discussed prior to the passage of the Federal water power act. Under that act the term is limited to 50 years, subject to renewal under certain conditions at the end of the 50-year period. Now, if a man puts in every dollar of his own money and assumes all the risk himself he can get a lease for 50 years. The proposal here is that if the Government furnishes him every dollar on which he goes in, then he ought to have 100 years. I see no reason, no legitimate reason, for extending that lease period

beyond the point of 50 years. Certainly the proposal put in here by Henry Ford is more favorable to him than anything that has ever been presented to the Federal Power Commission under the act, where the period is limited to 50 years; contains far more opportunities for making profit, because the power, three fourths of which at least will be available for Mr. Ford's private use, is subject to no regulation whatever by the Federal Government or by the State so long as he uses it in his own private operations, as it is his declared purpose to do. I believe, if the offer should be approved, that there is no manufacturing undertaking in which Mr. Ford would care to enter where power was any material factor in which any other concern in the United States could have a chance of competing with him.

In your discussions of this offer there has been no classification, nor any clear statement, of what is meant by the cost of production on which the 8 per cent profit is to be applied.

The CHAIRMAN. There has been a dispute about that several times. It is not clear in the contract.

Mr. MERRILL. Does it include interest on the property?

The CHAIRMAN. I do not know.

Mr. MERRILL. That is a very material matter, it seems to me.

The CHAIRMAN. Yes; I think it is very indefinite myself, Mr. Merrill.

Mr. MERRILL. If Mr. Ford is allowed to add interest on cost of construction of the property which he will own, when the Government gives it to him, that is on \$83,000,000, it will make a very considerable difference as to whether fertilizer can or cannot be produced at a profit, because the interest charges alone on \$83,000,000 at 4 per cent would be \$3,200,000 per annum; or, if taken at its written off value, say \$25,000,000, there again would be \$1,000,000 of interest charges per annum on property for which Mr. Henry Ford pays not one cent.

The CHAIRMAN. I think the representatives of Mr. Ford contend that this would be based on that part of the \$5,000,000 that he paid for all the property which would be the proportion that the particular part used in the manufacture of fertilizer bore to the entire property. I believe that was the contention, was it not, Senator?

Senator HEFLIN. How is that, Mr. Chairman?

The CHAIRMAN. I think that was the contention of his representatives.

Mr. MERRILL. That, of course, would be a reasonable division of it, but it seems to me that this point is important, and if you are to consider the question of getting a cheap fertilizer to the farmers, that it must be cleared up.

The CHAIRMAN. As a lawyer, I would be very doubtful whether a court, in construing that part of the proportion would give it that construction, and certainly Mr. Ford, or the corporation which is organized, would not be bound by the opinion of the men who testified here.

Mr. MERRILL. Not at all.

The CHAIRMAN. It seems to me if I were a court and required to pass upon the proposition as to what would be the basis of that computation I would take the value of the property and he should be entitled, I should think, to the interest on the value of the property, no matter whether he got it for nothing or what it cost him.

Senator HEFLIN. You could not figure in the cost of fertilizer the cost of horsepower that he used for the manufacture of automobiles.

The CHAIRMAN. Oh, no; I do not contend that.

Senator HEFLIN. You could only figure the horsepower used in producing fertilizer.

The CHAIRMAN. That would only be the horsepower that he used in the production of that fertilizer—

Senator HEFLIN. And that could be separated from the other, I should think.

Mr. MERRILL. But the question is this: First, whether he could do it; second, if he could do it, whether he should be allowed in the cost of the fertilizer to the farmers of the United States interest on property for which he pays not one cent.

The CHAIRMAN. Under his bid he would be allowed to do that, in my judgment, and I believe that any lawyer who would analyze that would say that was correct.

Senator HEFLIN. But if he could do that and make good, as Mr. Ford has suggested here, produce fertilizer at half price, he would be doing a service to the farmers of the country, wouldn't he?

Mr. MERRILL. If.

The CHAIRMAN. Anybody who will produce fertilizer at half the present cost will be doing a great good to everybody. There isn't any doubt about that.

Mr. MERRILL. Have you any other questions in regard to this phase?

The CHAIRMAN. No; but I will ask you to take up the other items.

Senator HEFLIN. Then your commission doesn't look with favor on Mr. Ford's offer?

Mr. MERRILL. I can not say. I am speaking as an individual here.

Senator HEFLIN. As an individual representing the commission, you do not look with favor on Mr. Ford's offer, do you?

Mr. MERRILL. I think Mr. Ford's offer gives more to him than there is any necessity for the United States giving in order to get that property operating down there. It seems to me that it is sheer, outright subsidy not only with respect to fertilizers, which might be justified, but that it is a sheer, outright subsidy to Mr. Henry Ford in his private operations.

Senator HEFLIN. Do you think any other party who bid here would take the property, use it in the manufacture of fertilizer, and sell fertilizer to the farmers at as advantageous a price as Mr. Ford would?

Mr. MERRILL. I would far prefer, if the judgment rested with me, to see the United States itself retain control of this property and operate it than to turn it over under the terms of any such proposal as his.

Senator HEFLIN. If it should operate them it would be in competition with private enterprise, wouldn't it?

Mr. MERRILL. Certainly.

Senator HEFLIN. I thought you said you were opposed to that?

Mr. MERRILL. I said I opposed it except under conditions where that seemed to be the only way out.

Senator HEFLIN. Would you favor the Government operating it and making fertilizer in time of peace and selling the fertilizer to the farmers?

Mr. MERRILL. I think it would be far preferable to this proposal here.

The CHAIRMAN. Of course, there is an excuse, in my judgment, for the Government operating this plant in time of peace or at any other time, because the Government has it, it had it as a war proposition, and it wants either to retain it or keep it in such shape that explosives can be made in time of war. There is more reason why it should operate a plant of that kind than there is for it to go out and engage in the development of some business where there wasn't any governmental function to be performed.

Senator HEFLIN. But would not all these forces that are now fighting the Ford offer, if the Government was to operate that plant in competition with them, fight that proposition? What they are fighting is competition. They don't care whether it comes from Henry Ford or the Government. Don't you think that is the situation?

Mr. MERRILL. I assume there is that feeling, yes, and there naturally would be. I think there is probably greater feeling of opposition against Henry Ford doing it than against the United States doing it, for the simple reason that the United States, if it charges the cost in, could not produce it as cheaply as Henry Ford, because he charges a part of the cost to himself and the rest to the United States, and the charge to the United States is all covered up.

Senator HEFLIN. And they would rather the Government would handle it or anybody else, than Henry Ford, because they believe Henry Ford will make good and that he will actually sell fertilizer cheaper and make them bring their price down, and that is the real cause of it.

Mr. MERRILL. There is no doubt that there might be that attitude on the part of the fertilizer people. I think, on the other hand, that Mr. Henry Ford himself is not going down there on a philanthropic enterprise to produce fertilizer for the United States, half as much as he is going to get the cheapest power in the United States for his own operations.

Senator HEFLIN. Well, wouldn't he be entitled to use it to his advantage if he would sell the product of his factory as reasonably as he sold his automobiles, when you compare the price of his automobile with the price of other automobiles?

Mr. MERRILL. That is all right, when he is spending his own money to do it.

Senator HEFLIN. He is offering to spend some of his money for a project now doing nothing, serving no good purpose, and Ford will make it useful to millions of our people if he gets it.

Mr. MERRILL. Mr. Chairman. I will just review briefly the differences in certain phrases of the Alabama Power Co. offer and the Ford offer. The Alabama Power Co.'s offer is to take a lease on the property there under the terms of the Federal water power act for a period of 50 years, and in so doing they will be subject to all the terms of the water power act. The properties will be subject to recapture at no increased cost at the end of the 50-year period. Their rates will be subject to regulation by either the Federal Power Commission or by the State of Alabama, or whatever State they operate in. Their construction will be subject to supervision by the United States and their operation will be subject to supervision by the United States. They will be required to pay all the charges, whatever they may be, for maintenance and operation of power houses and dams, with the sole exception of the locks; they will be required under the terms of the Federal water power act to set up adequate depreciation reserves covering the entire property.

Now, from a financial standpoint, there is this difference. The nitrate properties remain in the possession of the United States, with the exception of the steam plant. The Alabama Power Co. offers \$5,000,000 for the steam plants, which is the same price that Mr. Ford offers for the steam plants and all the rest of it. The steam plants are probably worth more than \$5,000,000. In any event it is, in this respect, as much better than the Ford offer as the difference between the cost of the steam plants and the cost of all the property.

The Government has \$17,000,000 invested in Dam No. 2, none in Dam No. 3, and the proposal is to build at this time only Dam No. 2.

Seventeen million dollars in Dam No. 2 is to be transferred to the Alabama Power Co., and they are themselves to raise the finances for the completion of the project, estimated by the Army engineers at \$25,000,000. In return for the use of the \$17,000,000 worth of property in the dam they will turn over, free of charge to the United States, or its designee, the second 100,000 primary horsepower, which we were discussing earlier, which means, in fact, about 82,000 horsepower years. The interest at 4 per cent per annum on \$17,000,000 is \$680,000 a year. In order for the 82,000 horsepower to offset the interest charges it would have to be computed as worth approximately \$8 a horsepower. I can put the exact figure in the record later. No; I have it here; \$8.30 per horsepower year, or 1½ mills per kilowatt hour.

If the Alabama Power Co. offer is given serious consideration there is one thing that needs to be cleared up in it in relation to this 100,000 secondary horsepower, and that is the relation of the load factor; whether they mean that after 100,000 horsepower at Dam No. 2, at 100 per cent load factor, is available for their use that the next 100,000 horsepower is available for the United States, or whether that first 100,000 horsepower means 100,000 horsepower of continuous energy, which would be modified materially by the load factor at which it is operated.

The CHAIRMAN. That is a point that has not been raised before, and it strikes me as being a very important consideration. I had not thought of it, I confess, and nobody had called it to our attention.

Mr. MERRILL. We will suppose, for instance, that they are operating on a 50 per cent load factor; and that 10,000 second-feet at that dam would produce 100,000 horsepower when operating at 100 per cent load factor. In order, then, to get 100,000 horsepower, they have got to have 20,000 second-feet flowing; that is, in order, to get it all the time. Now, the question is whether their 100,000 ends with the first 10,000 second-feet or with such an amount more as it would be necessary for them to have in order to get 100,000 horsepower continuously.

The CHAIRMAN. Of course that would make a very material difference as to the real amount of power that the Government was going to get.

Mr. MERRILL. Unless there are possibilities there, during the low-water period, which is the critical period of so regulating the discharge of the river as to affect the daily fluctuations, when of course that question would disappear.

Now, the question might be raised, I presume, why the transfer of \$17,000,000 worth of Government property to the Alabama Power Co. Why, if the offer in general is acceptable, should not the Government retain title to it and lease it? There is only this question there. You would have another Gorgas situation over again, only worse, because you would have in the same actual structure money invested by the Government and money invested by the power company, and it would be practically impossible for the power company, under such circumstances, to issue bonds or any other form of security against the investment there, because it would not own the property.

On the other hand the transfer of it for the lease period does not affect the interest of the United States at all, because at the end of the lease period, if the Government desires to acquire the properties, it can get them back at the price the company itself has put in; and it would not be required to pay a cent for its own \$17,000,000 worth of property, notwithstanding the fact that it might pass fee-simple title for it. I think the only question involved there is the question of the ability to handle the financial operations under a mixed ownership.

Of course the major difference between the two proposals is this—or perhaps I should say the one of major interest—that the Alabama Power Co. does not propose to go into the production of fertilizers. It seems to me, however, although I claim no knowledge whatever in regard to fertilizer production, that if the United States, owning the property for the production of fertilizers, the nitrate plants, and having turned over to it, free of cost, 82,000 horsepower which it can charge up at nothing in its operations, can not either itself produce fertilizers, or find somebody to whom it can turn over the property to produce fertilizers, at a figure which will reduce the present cost, then we had better leave the fertilizer manufacturing question alone for the present. There need be no investment charge and no power charge in its operation.

The CHAIRMAN. There would be an investment charge, but no power charge.

Mr. MERRILL. The Government need not charge interest unless it wishes to. It is not charging any interest under the Ford offer. In fact, under that offer, in addition to the \$1,000,000 per annum excess charges on account of its water-power plant, the Government will pay \$3,200,000 annual interest on the property that it is giving to Mr. Ford for nothing, so that it will be in the hole \$4,000,000 each year. It can hardly do worse by direct operation or by leasing the nitrate plants as an independent proposition.

The CHAIRMAN. The Alabama Power Co. offers to pay \$5,000,000 for the steam plant?

Mr. MERRILL. The same \$5,000,000 that Mr. Ford offers, or the same amount rather, only the Alabama Power Co. pays it for the steam plants alone.

The CHAIRMAN. And it gets title outright to the steam plants?

Mr. MERRILL. It gets title outright to the steam plants, in the same way in which Mr. Ford, for \$5,000,000, will get title outright, not only to the steam plants but to the nitrate plants, transmission lines, railroads, and everything.

The CHAIRMAN. Yes; and that includes the houses, residences, etc.?

Mr. MERRILL. Yes.

The CHAIRMAN. And the Alabama Power Co. leases those. They are included with the dam, but not with the nitrate plants, as I understand it.

Mr. MERRILL. My recollection is that they take only such buildings as are necessary for operation of the steam plants and hydro plants, but not the nitrate plants.

The CHAIRMAN. I think that is right. Of course, the Government owns at each one of these nitrate plants a small town.

Mr. MERRILL. Yes; so I understand.

The CHAIRMAN. Consisting of residences which are modern and in good shape; and also at Dam No. 2 they have another town where their employees and officials live.

Mr. MERRILL. Yes. There is another general question that I think is worthy of consideration in connection with this whole proposition, and that is what use ought to be made, from the general public standpoint, of big power resources like that of the Tennessee River.

Colonel Keller, in his investigations of 1919 of power conditions during the war, found in the five States, Alabama, Tennessee, Georgia, and North and South Carolina, a power output of about 1,230,000,000 kilowatt hours, and he estimated at that time that an additional 1,000,000,000 kilowatt hours would be required within the next five or seven years. It has been three years since that report was prepared and the power output in the group of five States mentioned has in the meantime increased 1,400,000,000.

The CHAIRMAN. It has increased more in three years than he estimated it would increase in five years?

Mr. MERRILL. It has increased 40 per cent more in three years than he estimated it would increase from five to seven years. The output has more than doubled in those five States in the last three years and there will be necessarily an increased demand in that territory for power in the future.

I have made up a few figures here showing the output of electrical energy in that group of Southern States since 1907. Those States include, in addition to the five that I have named, Arkansas, Florida, Kentucky, Louisiana, and Mississippi, all of which are within transmission range of Muscle Shoals.

Those five States last named, in the year 1907, produced only 103,000,000 kilowatt hours of electrical energy. In 1912 they had increased it to 165,000,000; in 1917, they had gotten up to 269,000,000, and in 1921 to 850,000,000. The percentage of increase per annum are: 1907 to 1912, 32 per cent, from 1912 to 1917, 35 per cent, and from 1917 to 1921, 14 per cent.

The States of Louisiana and Mississippi, and a large portion of Florida, have no hydro power. They are dependent upon steam power at the present time and their rate of use of power is much less than it is in the five States which have hydropower: that is, Alabama, Georgia, the two Carolinas, and Tennessee. There is no doubt an opportunity largely to increase the use of electrical power in these Gulf States in the next few years by the substitution of hydropower for steam power. New Orleans is probably within practical transmission distance of Muscle Shoals; it certainly is within practical transmission distance of the southern network of the Alabama Power Co.'s transmission system. It seems to me that the best interests of the South itself will be better met if power resources, like that of the Tennessee River, are made available for general public utility use in the whole southern section, than if we repeat at Muscle Shoals what we have hitherto done at Niagara, turn an enormous resource like that to private use for manufacturing purposes for a single locality.

The criticisms constantly brought before the Federal Power Commission, when they were handling the leases and permits for Niagara, were to the effect that it should prohibit in the future any such utilization of a great natural resource as had been done when the powers at Niagara had been devoted almost exclusively to private manufacturing operations. Demand was made by the city of Buffalo that conditions be put into any future grants that the power should be subject to public utility use in the New York industrial district, under such conditions as might be agreed upon by the Federal Power Commission and the Public Service Commission of New York State.

It is only where power resources like this can be distributed over a wide territory that you can get real industrial development, and a certain section of the South at the present time is second only to the Pacific coast in the extent to which it is producing hydroelectric energy. That section embraces the northwestern part of the Carolinas, upper Georgia and Alabama, and Tennessee. There is no reason in my judgment, why the same advantages should not accrue to the entire south, including the Gulf section, which at present has nothing except steam power, if a big resource like the Tennessee River is put into the general transmission net work, and I personally have more interest in seeing a general development of the South than the individual advantage of any applicant before this committee. Because the Alabama Power Co.'s offer not only presents what I believe is a reasonable basis for negotiating the details of a financial arrangement with the Government, but also, and primarily, because it proposes to serve the entire South with electric energy from Muscle Shoals, its offer, in my opinion, is far better than any other before you and should be given serious consideration by your committee.

Senator HEFLIN. If Mr. Ford should get Muscle Shoals and he could manufacture fertilizer on a large scale, as his representatives claim that he will, wouldn't he be developing the South considerable?

Mr. MERRILL. Yes; and we would have then, if that were a fact and if it can and would be done, a balance between these two advantages—on one you would lose and on the other you would gain.

Senator HEFLIN. Suppose he could reduce the cost of manufacturing automobiles down there and the spinning of cotton into cloth, wouldn't he be helping to build up the South?

Mr. MERRILL. No doubt he would. There is no doubt in my mind that the operations of Mr. Ford would mean advantage to the South. I do not question that. The question is whether there isn't a markedly better way, whether it is not better to develop the entire general industrial situation in that southern territory than to intensively develop one particular section.

The CHAIRMAN. And there is a question, in addition to that, Mr. Merrill, as to whether the Government should subsidize any corporation to go into any business, however legitimate it might be, by giving them advantages that nobody else can possess unless they get a subsidy from somebody.

Mr. MERRILL. My last remarks were free of any consideration of a subsidy, even if Mr. Henry Ford secured that proposition and secured it on the terms that were reasonable. I think the terms at present are utterly unreasonable.

The CHAIRMAN. I presume, from your position on the Federal Power Commission, and I judge from your testimony, that you have come, and the commission has come, in direct contact with the question that where there is power in a navigable stream that belongs to the country, the question at once arises whether you ought to permit that power to be utilized for private advantage when it could be utilized by the public; for instance, supplying cities with electrical power. In other words, as between supplying an individual or corporation for private use, admitting that it would be nice if they could have it, but between the Government giving to them the right to use water power for private use and giving it to a city for public use, you are up against that question continuously, I suppose?

Mr. MERRILL. Yes, sir.

The CHAIRMAN. And it is your judgment that, everything else being equal, when those two interests clash, that the right to the use of power which is generated from public streams ought to go to the public rather than to private corporations?

Mr. MERRILL. Yes, sir, and it goes even beyond that point, Mr. Chairman. It is a question of the use. A grant may be made to a private corporation to generate power, but to generate it and deliver it for a public use.

The CHAIRMAN. Yes.

Mr. MERRILL. I think we have no better illustration of the different methods of procedure than at Niagara on the two sides of the river. On the American side of the river we have power generated 90 per cent of which is used for manufacturing operations there, some 40,000 horsepower delivered to Buffalo for utility purposes, and the balance of it, so far as I am aware, being used solely for manufacturing purposes, and

the people of Buffalo, one of the largest cities in the State of New York, are dependent on steam power to get the lighting in their homes and the power to run their street railways.

The CHAIRMAN. And almost in sight of the power?

Mr. MERRILL. Almost in sound of the Falls. On the other side of the river you have that power generated and put into a big transmission system under one control, spread all over the Province of Ontario, at rates which are probably not one-third of the rates which were being paid in the Province of Ontario before the hydroelectric commission went in.

The CHAIRMAN. How do those rates compare with the rates charged on this side to private consumers in the cities and villages?

Mr. MERRILL. There is not any material difference in the average price received if you take the entire output. You gentlemen, of course, have seen the report of Murray & Flood. I haven't examined it in detail, but I believe their report is approximately correct. There may be errors in detail here and there, but they say if you exclude taxes from the price received for utility power in certain sections of the United States—and they compared California with Ontario—that the rate received per kilowatt hour generated is approximately the same in the State of California and in the Province of Ontario. Their conclusion was that it was a little in favor of the State of California. But there is this difference in the situation: The domestic user in Ontario pays far less for his power on the average than is paid by the citizen of the State of California. That is the element with regard to the Ontario situation which you hear and that is the one on which propaganda is distributed; but they have a different rate structure. In the State of California rates are based on the cost of service per class of service, and they are apparently based in Ontario on the cost of service as a whole, and the distribution of the cost between the various users is a political, not an economic question at all.

The CHAIRMAN. There they have one class paying a higher rate and another class paying a lower rate.

Mr. MERRILL. Yes. The domestic user who gets his power in Ontario at a rate varying from 1.2 cents to 19 cents per kilowatt hour on an average pays less than the domestic user in the State of California; but the power user pays more. The domestic use is a very small proportion of the total, so that you can adjust your rate structure materially with respect to the domestic use and make very little difference in total receipts. The point that always sticks out in any schedule is the rate that the domestic user pays. If you can cut that rate in half or by one-third, you can say that you are doing a wonderful thing, and can then obscure every bit of it by adding a mill somewhere else. But there is this that must be said of the Ontario development, that it has markedly reduced the cost of power on the average in the Province of Ontario. It has distributed power to sections that never had it before, and it is a shining example of the different use of a great resource—one on the Ontario side distributing it for the public benefit, for the benefit of all the public within range, and one on the American side distributing it under long-term contracts for manufacturing operations with only a very small percentage available for public-utility use. Now, I do not believe that that scheme should be repeated at Muscle Shoals. I do not believe it is in the public interest to do so.

I do not know that I have anything further to say on that, Mr. Chairman.

The CHAIRMAN. Have you analyzed Mr. Engstrum's proposition?

Mr. MERRILL. Oh, yes. I had forgotten Mr. Engstrum's proposition. I think the most that can be said about Mr. Engstrum's proposition is this: That he proposes a scheme whereby the United States will put in every dollar that is invested down there and shall pay his corporation first, a 5 per cent fee for construction purposes. Now, if we consider the power plants alone, there is \$17,000,000 already in, and the fee on the \$50,000,000 yet to go in, would mean at least two and a half million dollars. It is proposed that the steam plants be reconstructed, which will cost another ten million; that a second nitrate plant be built at No. 3, which would probably cost \$25,000,000, and that means \$35,000,000 more on which a 5 per cent fee would be between one and two million dollars.

He proposes further that he shall receive as compensation for operation of the plant one-third of the proceeds—not one-third of the profits, but one-third of the proceeds—from the sale of power plant at No. 2 in excess of the requirements for operating nitrate plant No. 2 at a capacity of 110,000 tons of ammonium nitrate per annum; that he shall receive the proceeds from one-fourth of the power produced at Dam No. 3, in excess of the requirements for power at nitrate plant No. 3, nitrate plant No. 3 to have the same capacity with relation to Dam No. 3 that nitrate plant No. 2 has to Dam No. 2. That is as I recollect it. I have seen his proposal only in the stenographic report. He has modified it to such an extent that the original and that report are not comparable.

If we assume, therefore, that development is made to the extent proposed by Mr. Ford, 850,000 installation at the two dams, producing 3,000,000,000 kilowatt hours, there should be available for sale from Dam No. 2, after meeting the requirements of nitrate plant No. 2, 1,400,000,000 kilowatt hours, and from Dam No. 3, after meeting the requirements of nitrate plant No. 3, 600,000,000 kilowatt hours. If we assume that this power may be sold at 4 mills a kilowatt hour, one-third of the proceeds of the surplus power at Muscle Shoals would be \$1,870,000 per annum, and one-fourth of the proceeds from Dam No. 3 would be \$600,000 per annum, or a total of \$2,470,000. Now, it is very possible that he can get 4 mills for this power, because he is going to sell primary power and use secondary to operate his nitrate plants, as I understand his plan. In addition he is to have the profit on one-fourth of the fertilizer compounds, or is to have a certain amount of the profits, anyway, on the fertilizer compounds, and he is to have the proceeds from the sale of 25 per cent of the by-products. Now, I do not know anything about what that would amount to. We can assume, however, that if this scheme goes through and if it is developed up to the full capacity of the stream for hydropower that he ought to get at least \$3,000,000 per annum out of it under the terms of his offer, which is a fairly good sized fee for operating the works.

Now, as I understand his offer, he does not propose to operate the nitrate plants from his hydropower available for the purpose, but that he would only operate to the extent that the receipts from the sale of power, fertilizer, and by-products leaves a sum available for operation, except, I believe, that he would make a modification to this effect—I think this was made a few days ago—that at the beginning the corporation would advance the moneys necessary for starting the operation of these plants, subject to having the money returned at the earliest possible date.

The CHAIRMAN. And another modification, I think, was that he agreed to pay 20 per cent of his profits.

Mr. MERRILL. Twenty per cent of his share of the receipts from the sale of power, if necessary.

The CHAIRMAN. If necessary, yes. Whenever there isn't enough money in the other funds to operate the plants he will put in 20 per cent of his share of the proceeds from the sale of power.

Mr. MERRILL. Now, the question arises here what is meant by operating expenses. I haven't the exact language here, but operating expenses to include maintenance, repairs, renewals, but not to include salaries to officers, directors, etc. I see nowhere in the proposition that the interest charges on the investment should be considered an operating expense, or any proposal anywhere in the Engstrom offer, anything that will not make the interest charges an obligation on the United States Treasury. I see nothing which indicates that interest charges are to be considered in any respect in connection with the operation of the nitrate plants and the power plants.

Again, operating expenses for this initial period are to be increased, or rather the operating fund is to be increased, by whatever amount the United States may get from the sale of the Gorgas steam plant or its interest in the Gorgas steam plant.

Now, we would have approximately this situation, looking at it from a financial standpoint, in regard to the Engstrom proposal.

There is an investment at Muscle Shoals in connection with the nitrate plants and power plants of \$105,000,000 in round numbers. There is proposed to be invested, new money, in the construction of power plant No. 3 and the completion of power plant No. 2, \$50,000,000. Mr. Engstrom proposes to reconstruct the steam plant at Sheffield, to add about 30,000 kilowatts more, at a cost that we will say is ten million. He proposes that when power plant No. 3 is completed there shall be built a nitrate plant No. 3 which will bear the same relation in capacity to dam No. 3 that the present plant does to Dam No. 2. Suppose we call that \$25,000,000. There will then be a total investment of United States funds of \$190,000,000. Now, that property will not have a reproduction value of that amount, because the investment in nitrate plants is much greater, presumably, than would have been required if construction was undertaken at present. I have assumed that the reproduction value of the power plants, the major part of which will be new investment, is \$65,000,000, that the reproduction value of nitrate plant No. 2 is \$25,000,000, and the reproduction value of nitrate plant No. 3, which would be new, \$25,000,000, giving a total of \$115,000,000. Therefore, if this is to be handled as a business proposition, the balance of \$75,000,000 which apparently would be in there if the proposal of Mr. Engstrom should be accepted should be amortized—be wiped out as a capital expense during the term of the lease. The annual interest charges on the reproduction value, as assumed by these figures, would amount to \$4,160,000 per annum. If the \$75,000,000 of excess cost over valuation is to be amortized over a period of 50 years at 4 per cent, paying interest in the meantime on the deferred balance, that would add \$3,490,000. There

is no provision in the Engstrum proposal for depreciation other than that which may be represented by renewals of operating property. I have assumed that of all the investment in power plant, taken at \$65,000,000, \$25,000,000 represents practically all the property subject to fairly rapid depreciation, that that figured at 3 per cent per annum would give a depreciation charge of \$750,000. The balance I have figured at one-half of 1 per cent, or \$200,000.

Fifty million dollars is to be invested in two nitrate plants, which, I understand, is rapidly depreciable property. If we applied 4 per cent depreciation upon that, we have \$2,000,000 more, or the depreciation requirements of the investment would be \$2,950,000 per annum. I have assumed that of that \$2,950,000, \$1,500,000 would be taken up in operating charges as renewals, which would leave then the liability of the United States for interest, amortization, and depreciation approximately \$9,000,000 per annum under the Engstrum proposal.

The CHAIRMAN. What is that?

Mr. MERRILL. \$9,000,000 per annum for interest, depreciation, and amortization and not a dollar of that, so far as I can see, is covered in the Engstrum proposal.

The CHAIRMAN. There was still another proposition that I do not suppose was submitted to you.

Mr. MERRILL. You mean the Parsons offer?

The CHAIRMAN. Yes.

Mr. MERRILL. I have not really considered the Parsons offer, because it covers such a small part of the proposition that I supposed it would not be considered.

The CHAIRMAN. Have you examined the bill that I have introduced?

Mr. MERRILL. I have just glanced through it, Mr. Chairman.

The CHAIRMAN. Are you prepared to make any comment on it?

Mr. MERRILL. Any comments I would make would just be along general lines.

The CHAIRMAN. I would be glad if you would examine that and come before us again, before we get through, and give us your ideas on it.

Mr. MERRILL. I have this general feeling about the whole situation, that it is advisable for the Government to keep out of business operations unless it is forced into them by considerations which are beyond its control. That is, because the alternative is worse. There are certain rather serious difficulties in government operation which I see not only in connection with the Federal Government but in connection with municipal and State governments when they enter into business enterprises. One is that, do the best that you can, you can not keep a government operation out of politics. There is always a certain amount of politics that enters into it. Secondly, you can never get a legislative body, whether the Congress of the United States or a State legislature or a city council, into a position where they are willing to pay the prices for competent men. Those two, I think, are the major reasons why we have not done better in this country than we have done in matters of public ownership and operation.

The CHAIRMAN. In this bill I have recognized, as of course I have recognized outside of it, that anything of that kind operated by the Government must be kept out of politics or it will be a failure. I think I have covered that in the drawing of this bill.

Mr. MERRILL. I think you have gone as far as you possibly could go. I think if the Government is going into a business operation of any kind that it had better go into it as a stockholder in a corporation rather than going into it as a direct operator; but at the very start you have politics in the appointment of your boards of directors and you can not avoid it.

The CHAIRMAN. Not any more than you would have politics in the appointment of members of the Supreme Court?

Mr. MERRILL. No; possibly not.

The CHAIRMAN. I think that has been kept pretty free of politics. I have never heard the charge that there was any politics there.

Mr. MERRILL. I do not think I would quite admit that, Mr. Chairman, because of the fact that there are a great many people who do not respect other things who have a degree of respect for the Supreme Court and the sanctity of that court that they would not feel for a corporation of the United States.

The CHAIRMAN. That may be.

Senator HEFLIN. I think that is right.

The CHAIRMAN. I realize the danger and I know the evils of it, and I am trying to avoid it. If the bill I have introduced can be amended in any way, so as to make it more completely outside of the control of politics, I would like to have it done. I realize this, that the President might appoint and the Senate might confirm men who would constitute the board of directors of a governmental corporation who would make a failure of it. I know that may be true. I do not know how to escape that. I do not think the President would do it, however, because I do not think the under-

standing could be any clearer that he should get men outside of political consideration, and once they get in and are confirmed, I do not see how they can be controlled by any political consideration. I agree that the bill might be amended so as to get it away from Congress. That is one of the objections that Mr. Merrill makes, and it is a good one, that legislative bodies can not handle these things. They must decide questions of politics. I want to put this corporation where it will get a return for the sale of power; where it can control itself; where it can operate and do everything that any other corporation can do and be subject to the same liabilities and everything.

Of course Congress could repeal the law and put it out of existence; that is true. (Appendix to the testimony of O. C. Merrill is here printed in full, as follows:)

APPENDIX.

Summary of financial aspect of Henry Ford's Muscle Shoals offer, with interest on Government bonds from date of completion of Dam No. 2 until termination of lease taken at 4 per cent and at 3 per cent, and an assumption A, interest during construction not included in cost; assumption B, interest during construction included in cost.

	Summary and comparison of items payable and items receivable.					
	With Government bonds after 1928 at 4 per cent.			With Government bonds after 1928 at 3 per cent.		
	Dam No. 2.	Dam No. 3.	Both.	Dam No. 2.	Dam No. 3.	Both.
ASSUMPTION A.						
Interest receivable.....	\$95,200,000	\$97,480,000	\$192,680,000	\$95,200,000	\$97,480,000	\$192,680,000

Memorandum on financial aspects of Henry Ford's offer for Muscle Shoals.

[Detailed computations.]

I. DAM NO. 2.

1. Financial statement (Annual Report Chief of Engineers):

Expenditures:		
1918.....	\$51, 122. 94	
1919.....	1, 238, 423. 65	
1920.....	6, 404, 527. 41	
1921.....	7, 840, 676. 94	
		\$15, 534, 750. 94
Gross sales.....		255, 922. 52
Net expenditures.....		15, 278, 828. 62
Liabilities, current.....		243, 394. 51
Uncompleted contracts.....		1, 238, 465. 95
Total.....		16, 760, 689. 08
"Total expenditures" as reported by Secretary of War, Feb. 1, 1922..		16, 251, 038. 14
Allotments (Annual Report Chief of Engineers):		
1918.....	\$13, 152, 177. 29	
1919.....	7, 433. 13	
1920.....	4, 000, 000. 00	
Total.....		\$17, 159, 610. 42

2. Assumption respecting completion, etc.:

Cost to complete in addition to expenditures and obligations already incurred.....	25, 000. 000
--	--------------

Time for completion, 3 years 4 months (Chief of Engineers).

Begin new construction on September 1, 1922.

One hundred thousand horsepower available on July 1, 1925.

Complete construction on December 31, 1925.

Lease to run for 100 years from July 1, 1925.

First interest "receivable" on June 30, 1926; rate, 4 per cent per annum, paid annually, not compounded.

First amortization "receivable" on June 30, 1932, paid semiannually and compounded at rate of 4 per cent per annum.

First interest payable: (a) Interest during construction on December 31, 1918; rate, 4½ per cent per annum, paid semiannually, not compounded; (b) interest on completed project on June 30, 1926; average rate, 4 per cent per annum, paid semiannually, not compounded.

First amortization "payable" on June 30, 1932; paid semiannually, and compounded at rate of 4 per cent per annum.

Interest credited at 4½ per cent per annum on "gross sales."

3. Schedule of expenditures and interest during construction:

A. On expenditures of \$16,251,040 already made:

Expended, fiscal year 1918, \$51,120—		
Interest for average of 6 months.....	\$1, 150	
Interest from July 1, 1918, to Sept. 1, 1922 ¹ (4½ years)....	9, 580	\$10, 730
Expended, fiscal year 1919, \$1,238,420—		
Interest for average of 6 months.....	27, 860	
Interest from July 1, 1919, to Sept. 1, 1922 (3½ years).....	176, 470	204, 330
Expended, fiscal year 1920, \$6,404,530—		
Interest for average of 6 months.....	144, 100	
Interest from July 1, 1920, to Sept. 1, 1922 (2½ years).....	624, 400	768, 500
Expended, fiscal year 1921, \$7,840,680—		
Interest for average of 6 months.....	176, 420	
Interest from July 1, 1921, to Sept. 1, 1922 (1½ years).....	411, 640	588, 060

¹ Assumed date of execution of contract.

A. On expenditures of \$16,251,040 already made—Continued.		
Expended, fiscal year 1922, \$716,290 ¹ —		
Interest for 3 months (1921, half year average).....	\$8,060	
Interest from Jan. 1 to Sept. 1, 1922 (8 months).....	21,490	
		<u>\$29,550</u>
Total.....		1,601,210
Less interest at 4 per cent per average of 2 years on "gross sales" of \$255,922.....		<u>23,030</u>
Total interest on \$16,251,040 to Sept. 1, 1922 (assumed date of execution of contract).....		1,578,180
Interest on same from Sept. 1, 1922, to Dec. 31, 1925 (assumed date of completion) (3½ years).....		<u>2,437,660</u>
Total interest on expenditures to date until assumed date of completion.....		4,015,840
B. On estimated further expenditures of \$25,509,650:		
Balance of calendar year 1922, \$309,650— ²		
Interest for average of 2 months.....	\$22,570	
Interest from Dec. 31, 1922, to Dec. 31, 1925 (3 years).....	406,300	
		<u>428,870</u>
Calendar year 1923, \$7,500,000—		
Interest for average of 6 months.....	168,750	
Interest from Dec. 31, 1923, to Dec. 31, 1925 (2 years).....	675,000	
		<u>843,750</u>
Calendar year 1924, \$7,500,000—		
Interest for average of 6 months.....	168,750	
Interest from Dec. 31, 1924, to Dec. 31, 1925 (1 year).....	337,500	
		<u>506,250</u>
Calendar year 1925, \$7,500,000—		
Interest for average of 6 months.....	168,750	
		<u>168,750</u>
Total.....		<u>1,947,620</u>
C. Total cost to Dec. 31, 1925:		
Expenditures to Feb. 1, 1922.....	16,251,040	
Estimated future expenditures.....	25,509,650	
		<u>41,760,690</u>
Total cash cost.....		41,760,690
Total interest during construction.....		<u>5,963,460</u>
Total actual cost.....		47,724,150
4. Interest receivable:		
6 years, at \$200,000 per annum.....	1,200,000	
94 years, at 1,000,000 per annum.....	94,000,000	
		<u>95,200,000</u>
5. Interest payable:		
Computed on two different assumptions as follows:		
(A) That interest-bearing obligations on account of Dam No. 2 outstanding on date of completion only to extent of capital expenditures of \$16,251,040 plus \$25,509,650 or \$41,760,690.		
(B) That interest during construction is part of cost, subject to subsequent interest charges.		
A. Interest from Dec. 31, 1925 (assumed date of completion) to July 1, 2025 (date of expiration of lease), 99½ years, at 4 per cent, on \$41,760,690.....		
Interest prior to Dec. 31, 1925.....	\$168,207,500	
		<u>5,963,460</u>
Total interest payable.....		172,170,960

¹ Difference between expenditures reported to July 1, 1921, by Chief of Engineers and amount (\$16,251,040) reported as expended to Feb. 1, 1922, by Secretary of War.

² \$2,500,000 new construction plus \$509,650 of liabilities and uncompleted contracts; i. e., difference between \$16,760,690 and \$16,251,040.

B. Interest prior to completion considered as part of investment cost.

Interest charges from Dec. 31, 1925, to July 1, 2025, 99½ years, at 4 per cent, on \$47,724,150 would make..... \$189,942,000

(Total interest payments by United States.)

6. Excess of interest payable over interest receivable:

Assumption A:

Interest payable.....	\$172,170,960
Interest receivable.....	95,200,000
Excess.....	76,970,960

Assumption B:

Interest payable.....	189,942,000
Interest receivable.....	95,200,000
Excess.....	94,742,000

7. Mr. Ford's average interest payment of \$952,000 per annum on account of Dam No. 2 would be 3.81 per cent on estimated cost of completion (\$25,000,000); 2.28 per cent on the estimated actual cash expenditure for the completed dam (\$41,760,690); and 2 per cent upon the estimated actual cost (\$47,724,150) including estimated interest during construction.

By the original offer of July 8, 1921, Mr. Ford agreed to pay interest as follows:

6 years, at \$200,000.....	\$1,200,000
94 years, at \$1,200,000.....	112,800,000
Total.....	114,000,000

or \$18,800,000 more than his present offer (if costs are as assumed in the preceding), an average difference of \$188,000 per annum.

8. Amortization receivable:

Assuming the preceding construction schedule, Mr. Ford would begin making payments to the United States for purposes of amortization on July 1, 1932, at the rate of \$19,868 semiannually, continuing the same for 94 years, or 188 semiannual payments. These payments, with compound interest at 4 per cent (semiannually at 2 per cent) would amount to—

\$19,868 × 2,019,225 ¹	\$40,117,960
or less than estimated cash cost by.....	1,642,730
and less than estimated actual cost, including interest during construction, by.....	7,606,190
The sum of all amounts received would be \$19,868 × 188.....	3,735,180

9. Amortization payable:

If the United States should amortize the cost of the dam and accessories in accordance with the schedule proposed by Mr. Ford and at the same rate of interest, 4 per cent, the semiannual payments required would be:

Assumption A: \$41,760,690 × 2,019,225.....	\$20,682
Assumption B: \$47,724,150 + 2,019,225.....	23,635
and the sum of all the amounts payable would be:	
Assumption A: \$20,682 × 188.....	3,888,220
Assumption B: \$23,635 × 188.....	4,443,380

¹ The amount to which \$1 per annum (or per fixed period) for "n" years (or periods) will accumulate at a given rate of interest, "i," per annum (or per period) is expressed by the formula—

$$A_n = \frac{(1+i)^n - 1}{i}$$

$$(1+i)^n = (1.02)^{188}$$

$\log(1+i) = \log(1.02) = 188 \log 1.02 = 188 \times 0.0086002 = 1.6168376$, for which corresponding number is 41.3845

$$A_{188} = \frac{41.3845 - 1}{0.02} = 2019.225$$

With $n = 194$,

$\log(1+i) = 194 \times 0.0086002 = 1.6684388$, for which corresponding number is 46.60568

$$A_{194} = \frac{46.60568 - 1}{0.02} = 2280.284$$

Logarithms from Vega's seven place tables.

10. Excess of amortization payable over amortization receivable:

Assumption A:

Per semiannum, \$20,682—\$19,868.....	\$814
Lease period, \$3,888,220—\$3,735,180.....	153,040

Assumption B:

Per semiannum, \$23,635—\$19,868.....	3,767
Lease period, \$4,443,380—\$3,735,180.....	708,200

11. Excess of items payable over items receivable:

Assumption A:

Interest excess.....	\$76,970,960
Amortization excess.....	153,040

Total.....	77,124,000
------------	------------

Assumption B:

Interest excess.....	94,742,000
Amortization excess.....	708,200

Total.....	95,450,200
------------	------------

II. DAM NO. 3.

12. Assumption respecting completion, etc.:

Cost of construction, \$25,000,000.

Cost of lands and rights of way, \$2,331,000.

Time for completion, three years.

Begin construction upon completion of Dam No. 2, i. e., on January 1, 1926.

Eighty thousand horsepower available on July 1, 1928.

Complete construction on December 31, 1928.

Lease to run for 100 years from July 1, 1928.

First interest "receivable" on June 30, 1929; rate, 4 per cent per annum, paid annually, not compounded.

First amortization "receivable" on June 30, 1932, paid semiannually and compounded at rate of 4 per cent per annum.

First interest rate payable:

(a) Interest during construction on June 30, 1926; rate $4\frac{1}{2}$ per cent per annum, paid semiannually, not compounded.

(b) Interest on completed project on June 30, 1929, average rate 4 per cent per annum, paid semiannually, not compounded.

First amortization "payable" on June 30, 1932; paid semiannually and compounded at rate of 4 per cent per annum.

13. Schedule of expenditures and interest during construction:

A. On estimated expenditure of \$27,331,000:

Calendar year 1926.....	\$9,331,000	
Interest for 6 months.....	209,950	
Interest from Dec. 31, 1926, to Dec. 31, 1928 (2 years)...	839,790	\$1,049,740
Calendar year 1927.....	9,000,000	
Interest for 6 months.....	202,500	
Interest from Dec. 31, 1927, to Dec. 31, 1928 (1 year)...	405,000	607,500
Calendar year 1928.....	9,000,000	
Interest for 6 months.....	202,500	
Total of interest during construction.....	1,859,740	

B. Total cost to Dec. 31, 1928:

Construction of works.....	25,000,000
Lands and flowage rights.....	2,331,000
Total cash cost.....	27,331,000
Interest during construction.....	1,859,740
Total actual cost.....	29,190,740

14. Interest receivable:	
3 years at \$160,000 per annum.....	\$480,000
97 years at \$1,000,000 per annum.....	97,000,000
Total.....	97,480,000
15. Interest payable:	
Computed on two assumptions, as follows: (A) That interest-bearing obligations on account of Dam No. 3 outstanding only to extent of capital expenditures of \$27,331,000; (B) that interest during construction is part of cost subject to subsequent interest charges.	
A. Interest from Dec. 31, 1928 (assumed date of completion), to July 1, 2028 (date of expiration of lease), 99½ years at 4 per cent on \$27,331,000.	
Interest prior to Dec. 21, 1928.....	\$108,777,400
	1,859,740
Total interest payments by United States.....	110,637,140
B. Interest during construction considered as part of investment cost, interest charges from Dec. 31, 1928, to July 1, 2028, 99½ years at 4 per cent on \$29,190,740, would make.....	
	116,179,100
16. Excess of interest payable over interest receivable:	
Assumption A:	
Interest payable.....	\$110,637,140
Interest receivable.....	97,480,000
Excess.....	13,157,140
Assumption B:	
Interest payable.....	116,179,100
Interest receivable.....	97,480,000
Excess.....	18,699,100
17. Mr. Ford's average interest payment of \$974,800 per annum on account of Dam No. 3 is 3.90 per cent on the estimated cost of structures (\$25,000,000), 3.57 per cent on the estimated cost of structures, land, and flowage (\$27,331,000), and 3.34 per cent on the estimated actual total (\$29,190,740), including interest during construction.	
By the original offer of July 8, 1921, Mr. Ford agreed to pay interest as follows:	
3 years at \$160,000 per annum.....	\$480,000
97 years at \$480,000 per annum.....	46,560,000
Total.....	47,040,000
Or \$50,440,000 less than his present offer (if costs are as assumed in the preceding); an average difference of \$504,400 per annum.	
18. Amortization receivable:	
Assuming the preceding construction schedule Mr. Ford would begin making payments to the United States for purposes of amortization on July 1, 1932, at a rate of \$3,505 semiannually, continuing the same for 97 years or 194 semiannual payments. These payments with compound interest at 4 per cent (semiannually at 2 per cent) would amount to: $\$3,505 \times \$2,280.284^1$, \$7,992,400, or less than the estimated cash cost by \$19,338,600, and less than the estimated actual cost including interest during construction by \$21,198,340. The sum of all amounts received would be: $\$3,505 \times 194 = \$679,970$.	
19. Amortization payable:	
If the United States should amortize the cost of the dam and accessories in accordance with the schedule proposed by Mr. Ford and at the same rate of interest, 4 per cent, the semiannual payments would be:	
Assumption A: $\$27,331,000 \div 2,280.284 = \$11,986$. Assumption B: $\$29,190,740 \div 2,280.284 = \$12,801$, and the sum of all the amounts payable would be: Assumption A: $\$11,986 \times 194 = \$2,325,280$. Assumption B: $\$12,801 \times 194 = \$2,483,390$.	
20. Excess of amortization payable over amortization receivable:	
Assumption A:	
Per semiannum, $\$11,986 - \$3,505$	\$8,481
Lease period, $\$2,325,280 - \$679,970$	1,645,310
Assumption B:	
Per semiannum, $\$12,801 - \$3,505$	9,296
Lease period, $\$2,483,390 - \$679,970$	1,803,420

¹ See note to page 5 preceding.

21. Excess of items payable over items receivable:

Assumption A:	
Interest excess	\$13, 157, 140
Amortization excess	1, 645, 310
Total	<u>14, 802, 450</u>
Assumption B:	
Interest excess	18, 699, 100
Amortization excess	1, 803, 420
Total	<u>20, 502, 520</u>

III. SUMMARY OF DAMS NO. 2 AND NO. 3.

22. Cost:

Assumption A:	
Dam No. 2	\$41, 760, 690
Dam No. 3	27, 331, 000
Total	<u>69, 091, 690</u>
Assumption B:	
Dam No. 2	47, 724, 150
Dam No. 3	29, 190, 740
Total	<u>76, 914, 890</u>

23. Interest receivable:

Dam No. 2	\$95, 200, 000
Dam No. 3	97, 480, 000
Total	<u>192, 680, 000</u>

Or \$1,926,800 per annum.

24. Interest payable:

Assumption A:	
Dam No. 2	\$172, 170, 960
Dam No. 3	110, 637, 140
Total	<u>282, 808, 100</u>

Or \$2,828,080 per annum.

Assumption B:	
Dam No. 2	\$189, 942, 000
Dam No. 3	116, 179, 100
Total	<u>306, 121, 100</u>

Or \$3,061,210 per annum.

25. Excess of interest payable over interest receivable:

Assumption A:	
Dam No. 2	\$76, 970, 960
Dam No. 3	13, 157, 140
Total	<u>90, 128, 100</u>

Or \$901,280 per annum.

Assumption B:	
Dam No. 2	\$94, 742, 000
Dam No. 3	18, 699, 100
Total	<u>113, 441, 100</u>

Or \$1,134,410 per annum.

26. Amortization receivable, lease period:	
Dam No. 2.....	\$3, 735, 180
Dam No. 3.....	679, 970
Total.....	4, 415, 150
Or \$23,373 per semiannum.	
27. Amortization payable:	
Assumption A:	
Dam No. 2.....	\$3, 888, 220
Dam No. 3.....	2, 325, 280
Total.....	6, 213, 500
Or \$32,668 per semiannum.	
Assumption B:	
Dam No. 2.....	\$4, 443, 380
Dam No. 3.....	2, 483, 390
Total.....	6, 926, 770
Or \$36,436 per semiannum.	
28. Excess of amortization payable over amortization receivable:	
Assumption A:	
Dam No. 2.....	\$153, 040
Dam No. 3.....	1, 645, 310
Total.....	1, 798, 350
Or \$9,295 per semiannum.	
Assumption B:	
Dam No. 2.....	708, 200
Dam No. 3.....	1, 803, 420
Total.....	2, 511, 620
Or \$13,063 per semiannum.	
29. Excess of items payable over items receivable:	
Assumption A:	
Dam No. 2.....	\$77, 124, 000
Dam No. 3.....	14, 802, 450
Total.....	91, 926, 450
Or average of \$919,260 per annum.	
Assumption B:	
Dam No. 2.....	\$95, 450, 200
Dam No. 3.....	20, 502, 520
Total.....	115, 952, 720
Or average of \$1,159,530 per annum.	

IV. "PRESENT WORTH" OF ITEMS PAYABLE AND ITEMS RECEIVABLE.

AS OF JULY 1, 1925, DATE OF BEGINNING OF LEASE PERIOD FOR DAM NO. 2.

30. To find the value as of July 1, 1925 (date of beginning of "lease period" of Dam No. 2), of the proposed payments by Mr. Ford of interest and amortization and of corresponding costs to United States on assumption cost of properties amortized at end of lease period. Interest payments under lease to be made annually on July 1 for the preceding year and interest payments by the United States semiannually on July 1 and January 1 for the preceding half year.

31. Interest receivable:

Dam No. 2:

First payment, \$200,000 on July 1, 1926, 5 succeeding payments of same amount at 12-month intervals; value as of July 1, 1925, $\$200,000 \times 5.2421388^1$	\$1, 048, 430
\$1,000,000 on July 1, 1932, and on each succeeding July 1, for 94 payments; value as of July 1, 1931, $\$1,000,000 \times 24.37371989 = \$24,373,720$; value as of July 1, 1925, $\$24,373,720 \times 0.7903152$	19, 262, 920
Total.....	<u>20, 311, 350</u>

Dam No. 3:

First payment, \$160,000 July 1, 1929, two succeeding payments of same amount at 12-month intervals; value as of July 1, 1928, $\$160,000 \times 2.7750910 = \$444,015$; value as of July 1, 1925, $\$444,015 \times 0.8889964$	394, 730
\$1,000,000 on July 1, 1932, and on each succeeding July 1 for 97 payments; value as of July 1, 1931, $\$1,000,000 \times 24.44324588 = \$24,443,246$; value as of July 1, 1925, $\$24,443,246 \times 0.7903152$	19, 317, 870
Total.....	<u>19, 712, 600</u>
Grand total value of interest receivable.....	<u>40, 033, 950</u>

32. Interest payable:

Assumption A. Interest during construction not included in cost, but values of interest during construction computed on assumption that amounts heretofore taken for any year payable one-half at end of each six months period:

Dam No. 2, cash cost, \$41,760,690; interest during construction, with value as of July 1, 1925—

Payable on Dec. 31, 1918 (6½ years).....	\$13, 360	
Value, $\$13,360 \times 1.02 \times 1.265318$		\$17, 240
Payable on June 30, 1919 (6 years).....	12, 210	
Value, $\$12,210 \times 1.265318$		15, 450
Payable on Dec. 31, 1919 (5½ years).....	96, 760	
Value, $\$96,760 \times 1.02 \times 1.216652$		120, 010
Payable on June 30, 1920 (5 years).....	96, 760	
Value, $\$96,760 \times 1.216652$		117, 720
Payable on Dec. 31, 1920 (4½ years).....	257, 010	
Value, $\$257,010 \times 1.02 \times 1.169858$		306, 680
Payable on June 30, 1921 (4 years).....	256, 950	
Value, $\$256,950 \times 1.169858$		300, 600
Payable on Dec. 31, 1921 (3½ years).....	357, 590	
Value, $\$357,590 \times 1.02 \times 1.124864$		410, 280
Payable on June 30, 1922 (3 years).....	366, 240	
Value, $\$366,240 \times 1.124864$		411, 970
Payable on Dec. 31, 1922 (2½ years).....	387, 630	
Value, $\$387,630 \times 1.02 \times 1.081600$		427, 610
Payable on June 30, 1923 (2 years).....	517, 720	
Value, $\$517,720 \times 1.081600$		559, 970
Payable on Dec. 31, 1923 (1½ years).....	517, 750	
Value, $\$517,750 \times 1.02 \times 1.04$		549, 230
Payable on June 30, 1924 (1 year).....	686, 490	
Value, $\$686,490 \times 1.04$		713, 950
Payable on Dec. 31, 1924 (½ year).....	686, 500	
Value, $\$686,500 \times 1.02$		700, 230
Payable on June 30, 1925.....	855, 240	
Value.....		855, 240
Payable on Dec. 31, 1925 (¼ year).....	855, 250	
Value, $\$855,250 \times 0.980392$		838, 480
Total.....	5, 963, 460	6, 344, 700

¹ Tabular values for \$1 for periods of 100 or less from Zaldari's "Annuities and amortization tables," 1917; for periods in excess of 100 computed from formulae with Vega's 7-place logarithmic tables.

Assumption A. Interest during construction not included in cost, but values of interest during construction computed on assumption that amounts heretofore taken for any year payable one-half at end of each six months period—Con.

Dam No. 2 cash cost, \$41,760,690; interest during construction, with value as of July 1, 1925—Continued.

Value as of Dec. 31, 1925, of 199 interest payments of \$835,213.80 made semiannually from said date to and including July 1, 2025; said amount being the semiannual interest at 4 per cent on the cash cost of \$41,760,690, is $\$835,213.80 \times 49.028305^1 = \$40,949,120$; value as of July 1, 1925 = $\$40,949,120 \times 0.9803920 \dots \dots \dots \$40,146,190$

Total value of interest payable on Dam No. 2. 46,490,890

Dam No. 3, interest during construction with values as of July 1, 1925—

Payable on June 30, 1926 (—1 year).....	\$104,970	
Value, $\$104,970 \times 0.9615384 \dots \dots \dots$		\$100,930
Payable on Dec. 31, 1926 (—1½ years).....	104,980	
Value, $\$104,980 \times 0.980392 \times 0.9615384 \dots \dots \dots$		98,960
Payable on June 30, 1927 (—2 years).....	311,200	
Value, $\$311,200 \times 0.9245562 \dots \dots \dots$		287,720
Payable on Dec. 31, 1927 (—2½ years).....	311,200	
Value, $\$311,220 \times 0.980392 \times 0.9245562 \dots \dots \dots$		282,100
Payable on June 30, 1928 (—3 years).....	513,700	
Value, $\$513,700 \times 0.8889964 \dots \dots \dots$		456,680
Payable on Dec. 31, 1928 (—3½ years).....	513,690	
Value, $\$513,690 \times 0.980392 \times 0.8889964 \dots \dots \dots$		447,700

Total..... 1,859,740 1,674,090

Value as of Dec. 31, 1928, of 199 interest payments of \$546,620 made semiannually from said date to and including July 1, 2028, said amount being the semiannual interest at 4 per cent per annum on the estimated cash cost of \$27,331,000 is $\$546,620 \times 49.028305 = \$26,799,850$.

Value as of Dec. 31, 1925, is $\$26,799,850 \times 0.8889964 \dots \dots \dots 23,824,970$

Value as of July 1, 1925, is $\$23,824,970 \times 0.9803920 \dots \dots \dots 23,357,810$

Total value of interest payable on Dam No. 3.. 25,031,900

Grand total value of interest payable on No. 2 and No. 3..... 71,522,790

Assumption B. Interest during construction included in cost:

Dam No. 2, cost with interest, \$47,724,150—

Value as of Dec. 31, 1925, of 199 interest payments of \$954,483 made semiannually from said date to and including July 1, 2025, said amount being the semiannual interest at 4 per cent per annum on the above cost, $\$954,483 = 49.028305 = \$46,796,690$.

Value as of July 1, 1925 = $\$46,796,690 = 0.9803920 \dots \dots \dots 45,879,100$

¹ This quantity determined as follows:

Present value of \$1, payable in 99½ years, with interest compounded semiannually at 4 per cent, is same as \$1 payable in 199 years, with interest compounded annually at 2 per cent. The formula is:

$$V_n = (1+i)^{-n} \text{ or } V_n = \frac{1}{1.02^{199}}$$

$$\log. 1.02^{199} = 199 \log. 1.02$$

$$\log. 1.02 = 0.0086002$$

$$199 \log. 1.02 = 1.7114398$$

$$\text{Corresponding number} = 51.45644$$

$$1 + 51.45644 = 0.0194339$$

$$V_n = 0.0194339$$

The value of \$1 semiannually for 99½ years, with interest compounded semiannually at 4 per cent, is same as \$1 annually for 199 years, with interest compounded annually at 2 per cent. The formula is:

$$A_n = 1 - V_n = \frac{1 - 0.0194339}{0.02} = 49.028305.$$

Assumption B. Interest during construction included in cost—Continued.

Dam No. 3—Cost with interest \$29,190,740—

Value as of Dec. 31, 1928, of 199 interest payments of \$583,814 made semiannually from said date to and including July 1, 2028, said amount being the semiannual interest at 4 per cent per annum on the above cost is $\$583,814.80 \times 49.028305 = \$28,623,450$.

Value as of Dec. 31, 1925 = $\$28,623,450 \times 0.8889964 = \$25,446,140$.

Value as of July 1, 1925 = $25,446,140 \times 0.9803920 = \$24,947,190$

Grand total value of interest payments on No. 2 and No. 3.... 70,826,290

33. Excess of interest payable over interest receivable:

Assumption A..... 31,488,840

Assumption B..... 30,792,340

34. Amortization receivable:

Dam No. 2:

Value as of Dec. 31, 1931, of 188 semiannual payments of \$19,868 beginning on July 1, 1932, is $\$19,868 \times 48.7918^1 = \$969,400$.

Value as of Dec. 31, 1925 is $\$969,400 \times 0.7903152 = \$766,130$.

Value as of July 1, 1925 = $\$766,130 \times 0.9803920 = 751,110$

Dam No. 3:

Value as of Dec. 31, 1931, of 194 semiannual payments of \$3,505 beginning on July 1, 1932, is $\$3,505 \times 48.92717^2 = \$171,490$.

Value as of Dec. 31, 1925, is $\$171,490 \times 0.7903152 = \$135,530$.

Value as of July 1, 1925 = $\$135,530 \times 0.9803920 = 132,870$

Total value of amortization receivable..... 883,980

35. Amortization payable:

Assumption A:

Dam No. 2—

Value as of Dec. 31, 1931, of 188 semiannual payments of \$20,682, beginning on July 1, 1932, is $\$20,682 \times 48.7918 = \$1,009,110$;

value as of Dec. 31, 1925, is $\$1,009,110 \times 0.7903152 = \$797,510$;

value as of July 1, 1925 = $\$797,510 \times 0.9803920 = 781,870$

Dam No. 3—

Value as of Dec. 31, 1931, of 194 semiannual payments of \$11,986,

beginning on July 1, 1932, is $\$11,986 \times 48.92717 = \$586,440$;

value as of Dec. 31, 1925, is $\$586,440 \times 0.7903152 = \$463,470$;

value as of July 1, 1925 = $\$463,470 \times 0.9803920 = 454,380$

Total..... 1,236,250

$$^1 Vn = (1+i)^{-n} = \frac{1}{1.02^{188}}$$

$$\log 1.02 = 0.0086002.$$

$$188 \times 0.0086002 = 1.6168376.$$

$$\text{Corresponding number is } 41.3845.$$

$$1 + 41.3845 = 0.0241636.$$

$$A_n = \frac{1 - Vn}{i} = \frac{1 - 0.0241636}{0.02} = 48.79182.$$

$$^2 Vn = (1+i)^{-n} = \frac{1}{1.02^{194}}$$

$$\log 1.02 = 0.0086002.$$

$$194 \times 0.0086002 = 1.6684388.$$

$$\text{Corresponding number is } 46.80568.$$

$$1 + 46.80568 = 0.0214566.$$

$$A_n = \frac{1 - Vn}{i} = \frac{1 - 0.0214566}{0.02} = 48.92717.$$

Assumption B:

Dam No. 2—

Value as of Dec. 31, 1931, of 188 semiannual payments of \$23,635, beginning on July 1, 1932, is $\$23,635 \times 48.7918 = \$1,153,190$; value as of Dec. 31, 1925, is $\$1,153,190 \times 0.7903162 = \$911,380$; value as of July 1, 1925, is $\$911,380 \times 0.9803920 =$ \$893,510

Dam No. 3—

Value as of Dec. 31, 1931, of 194 semiannual payments of \$12,801, beginning on July 1, 1932, is $\$12,801 \times 48.92717 = \$626,320$; value as of Dec. 31, 1925, is $\$626,320 \times 0.7903152 = \$194,990$; value as of July 1, 1925, is $\$494,990 \times 0.9803920 =$ 485,280

Total..... 1,378,790

36. Excess of amortization payable over amortization receivable:

Assumption A..... \$852,270

Assumption B..... 494,810

37. Excess of items payable over items receivable:

Assumption A:

Interest..... \$31,488,840

Amortization..... 352,270

Total..... 31,841,110

Assumption B:

Interest..... 30,792,340

Amortization..... 494,810

Total..... 31,287,150

V. VALUE AT END OF LEASE PERIOD, JULY 1, 1925, OF EXCESS INTEREST AND AMORTIZATION PAYABLE BY UNITED STATES.

38. Assumption A:

Interest payable:

Value as of July 1, 1925, of interest during construction on Dam No. 2, \$6,344,700; value as of July 1, 1925= $\$6,344,700 \times 50.50449 =$ \$320,436,000

Value as of July 1, 1925, of 199 interest payments of \$835,213.80, made semiannually, beginning July 1, 1926, and ending July 1, 1925, is $\$835,213.80 \times 2,522.822^1 =$ 2,107,096,000

Value as of July 1, 1925, of interest during construction on Dam No. 3, \$1,674,090; value as of July 1, 1925= $\$1,674,090 \times 50.50449 =$ 84,549,000

Value as of July 1, 1925, of 193 interest payments of \$546,620, made semiannually, beginning July 1, 1928, and ending July 1, 1925, is $\$546,620 \times 2,234.592^1 =$ 1,221,473,000

Value as of July 1, 1925, of 6 semiannual payments of \$546,620, beginning Dec. 31, 1925, is $\$546,620 \times 5.6014317 =$ 3,062,000

Total value of interest payable..... 3,736,616,000

39. Interest receivable:

Value as of July 1, 1925, of 6 interest payments of \$200,000 each on account of Dam No. 2, \$1,048,430; value as of July 1, 1925, is $\$1,048,430 \times 50.50449 =$ \$52,950,000

Value as of July 1, 1925, of 94 payments of \$1,000,000 per annum is $1,000,000 \times 972.8612 =$ 972,861,000

¹ For formula see page 5.

$$199 \times \log(1.02) = 199 \times 0.0086002 = 1.7114398$$

for which corresponding number is 51.45644

$$\text{Amount of } \$1 = \frac{51.45644 - 1}{0.02} = \$2,522.822$$

$$193 \times \log(1.02) = 193 \times 0.0086002 = 1.6598386$$

for which corresponding number is 45.60183

$$\text{Amount of } \$1 = \frac{45.60183 - 1}{0.02} = \$2,234.592$$

Value as of July 1, 1925, of 3 interest payments of \$160,000 each on account of Dam No. 3, \$394,730; value as of July 1, 1925, is \$394,730 × 50.50449=	\$19,936,000
Value as of July 1, 1925, of 94 payments of \$1,000,000 per annum is \$1,000,000 × 972.8612=	972,861,000
Value as of July 1, 1925, of 3 annual payments of \$1,000,000, beginning July 1, 1926, is \$1,000,000 × 2.7750910=	2,775,000
Total value of interest receivable.....	2,021,383,000
Excess value of interest payable.....	1,715,233,000
Assumption B:	
Interest payable—	
Value as of July 1, 1925, of 199 interest payments of \$954,483 made semiannually on account of Dam No. 2, beginning July 1, 1926, and ending July 1, 1925, is \$954,483 × 2522.822=	2,407,991,000
Value, similarly, account Dam No. 3 of 193 payments of \$583,814.80, beginning July 1, 1928, and ending July 1, 1925, \$583,814.80 × 2234.592=	1,304,588,000
Value as of July 1, 1925, of 6 semiannual payments of same amount beginning Dec. 31, 1925, is \$583,814.80 times 5.6014317 equal.....	3,270,000
Total value of interest payable.....	3,715,849,000
Total value of interest receivable.....	2,021,383,000
Excess value of interest payable.....	1,694,466,000

VI. ON ASSUMPTION THAT UNITED STATES FROM JULY 1, 1925 (ESTIMATED DATE OF COMPLETION OF DAM NO. 2), UNTIL EXPIRATION OF LEASE PERIOD PAYS INTEREST AT AVERAGE RATE OF 3 PER CENT PER ANNUM, THE FOLLOWING CHANGES WOULD BE MADE IN PRECEDING PARAGRAPHS.

5a. Interest payable, Dam No. 2:	
A. 99½ years at 3 per cent on \$41,760,690.....	\$124,655,660
Interest prior to Dec. 31, 1925.....	5,963,460
Total.....	130,619,120
B. 99½ years at 3 per cent on \$47,724,150.....	142,456,880
6a. Excess of interest payable on interest receivable, Dam No. 2:	
A. Total excess.....	35,419,120
B. Total excess.....	47,256,880
11a. Excess of items payable over items receivable, Dam No. 2:	
A. Total excess.....	35,572,160
B. Total excess.....	47,965,080
15a. Interest payable, Dam No. 3:	
A. 99½ years at 3 per cent on \$27,331,000.....	81,583,040
Interest prior to Dec. 21, 1928.....	1,859,740
Total.....	83,442,780
B. 99½ years at 3 per cent on \$29,190,740.....	87,134,360
16a. Excess of interest payable over interest receivable, Dam No. 3:	
A. Total excess.....	-14,037,220
B. Total excess.....	-10,345,640
17a. Excess of items payable over items receivable, Dam No. 3:	
A. Total excess.....	-12,391,910
B. Total excess.....	-8,542,220
24a. Interest payable, both dams:	
A. Total interest.....	214,061,900
B. Total interest.....	229,591,240
25a. Excess of interest payable over interest receivable, both dams:	
A. Net excess (or average of \$213,820 per annum).....	21,381,900
B. Net excess (or average of \$369,110 per annum).....	36,911,240
29a. Excess of items payable over items receivable, both dams:	
A. Net excess (or average of \$231,800 per annum).....	23,180,250
B. Net excess (or average of \$394,230 per annum).....	39,422,860

32a. Interest payable, both dams:

A. Dam No. 2—

Interest during construction.....	\$6,344,700
Semiannual interest of $\$626,410.35 \times 49.028305 \times 0.9803920$	30,109,640

Dam No. 3—

Interest during construction.....	1,674,090
Semiannual interest of $\$409,965 \times 49.028305 \times 0.8889964 \times 0.9803920$	17,518,360

Total..... 55,646,790

B. Dam No. 2 semiannual interest of $\$715,862.25 \times 49.028305 \times 0.9803920$ 34,409,320

Dam No. 3, semiannual interest of $\$437,861.10 \times 49.028305 \times 0.9803920 \times 0.8889964$ 18,710,400

53,119,720

33a. Excess value of interest payable over interest receivable, both dams:

A. Net excess.....	15,612,840
B. Net excess.....	13,085,770

37a. Excess value of items payable over items receivable, both dams:

A. Total excess.....	15,965,110
B. Total excess.....	13,580,110

5b. 39a. Assumption A:

Interest payable—

Dam No. 2—

During construction.....	320,436,000
Value as of July 1, 2025 of 199 interest payments of \$626,410.25; $\$626,410.35 \times 2,522.822$	1,580,322,000

Dam No. 3—

During construction.....	84,549,000
Value as of July 1, 2025 of 193 interest payments of \$409,965 $\$409,965 \times 234.592$	916,104,000
Value as of July 1, 2025 of 6 semiannual payments of same $\$409,965 \times 5.6014317$	2,296,000

Total value of interest payable..... 2,903,707,000

Total value of interest receivable..... 2,021,383,000

Excess value of interest payable..... 882,324,000

Assumption B:

Interest payable—

Dam No. 2—

Value as of July 1, 2025 of 199 semiannual payments of $\$715,862.25 = \text{same} \times 2,522.822$	1,805,993,000
--	---------------

Dam No. 3—

Value as of July 1, 2025 of 193 semiannual payments of $\$437,861.10 = \text{same} \times 2,234.592$	978,441,000
Value as of July 1, 2025 of 6 semiannual payments of $\$437,861.10 = \$437,861.10 \times 5.6014317$	2,453,000

Total of interest payable..... 2,786,887,000

Total of interest receivable..... 2,021,383,000

Excess value of interest payable..... 765,504,000

(Whereupon, at 1.30 o'clock p. m., the committee adjourned until Monday, May 15, 1922, at 2 o'clock p. m.)

MUSCLE SHOALS.

MONDAY, MAY 15, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 2 o'clock p. m., in room 224, Senate Office Building, Senator George W. Norris (chairman), presiding.

Present: Senators Norris (chairman), Keyes, Norbeck, Kendrick, and Heflin.

STATEMENT OF MR. L. STERN, CONSULTING ENGINEER, BALTIMORE, MD.

The CHAIRMAN. Mr. Stern, we have a proposition that you have sent to the committee, and we have sent for you in order to have you explain it to us, or say anything in regard to it that you desire to.

Mr. STERN. Well, the motive which actuated me in sending in this proposition was simply that I was really indignant at some of the clauses of the proposals I have seen. I come to Washington frequently, being engaged in furnishing supplies to the Government; while going to Baltimore. I saw one of the proposals that had been made. I considered it outrageous and decided to send a proposal of my own, for the reason that I believed the water powers of the country should be reserved for the use of the people.

The CHAIRMAN. What proposition was it that you saw?

Mr. STERN. I think it was tying up—

The CHAIRMAN. No; whose, I mean?

Mr. STERN. I think there were a number of them that I saw in the paper; one of them would tie up the rights to the power for a hundred years, I believe, with an option for an indefinite period after that, or something of that kind.

Senator KEYES. You don't recall whose proposition it was?

The CHAIRMAN. That was Mr. Ford's, I guess. That is the only one that puts the hundred-year limitation on.

Mr. STERN. There were a number of other clauses, and they all seemed to be just about the same, that the Government bear nearly all of the expense and the lessee obtain nearly all of the profit. So, then, I was actuated, not so much by monetary reasons as by the reasons which I have stated.

I suppose I should state my own experience. I was raised in Baltimore; went to the public schools there and graduated from the college, and from Johns Hopkins University. I have been engaged in electrical work, and afterwards in mining and chemical work, and also in furnishing supplies to the Government. I based my proposal on the proposal of which I had a rough outline, including such parts as I thought would meet with the approval of the Government. I think it was the Ford proposal that required 8 per cent profit on the manufacture of fertilizer. So I did not see why, considering that the Government owned the power and Government equipment was being used to produce the fertilizer, any profit should be made on that fertilizer, except perhaps what came from the charge for the power, which would be small. Anyway, 8 per cent profit seems to be a rather indefinite proposition. It is a matter largely of bookkeeping, as to what the 8 per cent profit would be. I think the farmer should be helped in every way possible. I don't know how this 110,000 tons of fertilizer mentioned was arrived at, but I suppose it fits in in some way with the military requirements of the War Department—

Senator KEYES. Have you ever visited this property at Muscle Shoals?

Mr. STERN. No, sir; I have never visited the property. It has really been over 20 years since I have been South. I have been located in the North.

As I stated, I think the farmer should be helped in every way. He is in a very peculiar situation. He is the pawn of the natural elements, and the prey of the unnatural ones, and anything that can be done to help the farmer should be done; when help to the farmer fits in with the military requirements of the Government it is not a matter of socialism, but it is a matter of highest patriotism.

Hence I propose that the 110,000 tons of fertilizer material which is to be made into useable fertilizer products should be furnished free; I think this would not interfere with the regular production of fertilizer by the manufacturers, because the quantity is not sufficiently large.

Then, secondly, a considerable sum of money spent here has been by the Government. I think the money expended should be repaid to the Government on some reasonable basis; that is, not the entire amount expended, because a large part of it was spent under the emergency of war conditions and does not represent present value, but such of it as represents present value should be repaid the Government at a certain rate—as I state here, at the rate of 2 per cent per annum, but any other rate that is reasonable would suit.

Besides, there was a clause in Mr. Ford's proposition, I think, to pay \$55,000 annually for maintenance of navigation. There is no reason why whoever has the power should not pay for the operation of the locks.

As I say, I was not actuated by mercenary motives. If I could prevent this plant from falling into the hands of a monopoly, or an individual corporation that would use it largely for its own profit, and could make a profit besides, I would be perfectly satisfied, and therefore I inserted that if there is any profit I would repay 60 per cent of it to the Government.

So that covers these clauses mentioned here. There is one other. The first one is the plant is to be completed under our supervision at Government cost. I think the plans all call for that, namely, that the Government complete the plant and pay for the work, and I just say 4 per cent interest should be allowed the Government on the amount expended, which should be charged as part of the expenses of the plant in calculating earnings.

This proposal is only a rough outline. Any kind of reasonable proposal would suit me that would give me a chance. I am not a millionaire, and I don't desire to make millions, and would not know what to do with them if I had them. So I have just presented a rough outline to you gentlemen.

I suppose the next thing is what I would do in case I should obtain the lease. First of all I intend to make fertilizer, 110,000 tons. That will probably be made largely during what you might call the off hours of the plant, using surplus power as far as possible. This power would probably take care of this 110,000 tons.

The CHAIRMAN. Do you mean by that secondary power?

Mr. STERN. Not necessarily.

The CHAIRMAN. Suppose you did have sale for all the power there, then what about fertilizer?

Mr. STERN. It would not matter. In the first place, the fertilizer is an essential part of the proposition; 110,000 tons of fertilizer must be furnished regardless of whether there is a demand for the power to be used for other purposes or not.

The CHAIRMAN. You speak in your bid of fertilizer?

Mr. STERN. Yes, sir.

The CHAIRMAN. One hundred and ten thousand tons of fertilizer. Now, 110,000 tons mentioned in Mr. Ford's bid is not fertilizer, but just one of the ingredients of fertilizer. It would make a great deal more fertilizer than that.

Mr. STERN. Yes. That is perfectly true. He proposes to furnish ammonium nitrate.

The CHAIRMAN. Is that what you mean when you say fertilizer?

Mr. STERN. Yes, sir; that is what I mean exactly. Then I think he proposes to convert that into fertilizer.

The CHAIRMAN. That is, as I understand it, the capacity of what is known as nitrate plant No. 2. One hundred and ten thousand tons is the capacity of that plant in ammonium nitrate, which is the same, as I understand, as 40,000 tons of nitrogen. That would make several million tons of completed fertilizer.

Mr. STERN. Yes, sir. I think the usual mixture is about two parts of nitrate, eight parts of phosphoric acid, and two parts of potash.

The CHAIRMAN. What I want to get clear is whether when you speak in your offer of 110,000 tons of fertilizer you mean 110,000 tons of ammonium nitrate.

Mr. STERN. Not necessarily ammonium nitrate; but I mean fertilizer material corresponding to ammonium nitrate. That product should be made which could be made to the best advantage.

The CHAIRMAN. That plant is specifically designed and equipped to get nitrogen out of the air.

Mr. STERN. Yes, sir. Ammonium nitrate, if that is the best product to produce, or some other product if ammonium nitrate is not the best; but what power is required to produce that 110,000 tons should be used. It just depends on what method you use.

The CHAIRMAN. You would expect to use enough power to produce that?

Mr. STERN. Yes, sir.

The CHAIRMAN. And sell the balance?

Mr. STERN. Not only that. I don't know how the 110,000 tons of ammonium nitrate was arrived at. Is that arrived at in conjunction with the War Department to meet military requirements?

The CHAIRMAN. Yes. That is all they could make out of it.

Mr. STERN. If it is not, the quantity should be changed to do that; but I think the first thing, one of the first essentials of this plant, should be to provide the Government with nitrate for military purposes, as there are no nitrates in this country.

The CHAIRMAN. In your bid here you use the word "we." What do you mean by that?

Mr. STERN. That is just an editorial expression. I come here representing no one except myself. I have no entanglements with anybody.

The CHAIRMAN. Suppose Congress accepted your bid. Would you expect to organize a company or corporation, or would you do it individually?

Mr. STERN. I would probably organize a corporation with a small amount of capital, which I would control myself, but would let the corporation enter into an agreement with the Government on such terms as would be proper.

The CHAIRMAN. Would you be able to organize a corporation with a paid-up capital of, say, \$10,000,000?

Mr. STERN. Yes, sir; or a hundred million, if you wish; but my idea is to organize a corporation with a capital of \$20,000, or thereabouts, for the purpose of operating in corporate form rather than individually.

The CHAIRMAN. You would accept it either on a 25-year or a 50-year basis?

Mr. STERN. Yes, sir; just because I am actuated by the motives I said. I think it should be for not less than 25 years, because it will probably be necessary to make contracts for power for 25 years.

The CHAIRMAN. Would you be willing to enter into a proposition whereby you would be required to put up a bond to comply with your part of the contract?

Mr. STERN. Yes.

The CHAIRMAN. Would it be material to you what the amount of that bond was?

Mr. STERN. No.

The CHAIRMAN. Have you made any arrangements for financial assistance in the event this is given to you? How do you know that you can carry through the financial part?

Mr. STERN. I know I can carry through the financial part. I have made no arrangements with anyone. I came here entirely unentangled. I am acquainted with people having large financial resources, and I am acquainted with large industrial corporations.

The CHAIRMAN. Have you means of your own to carry it out?

Mr. STERN. To do what I propose to do; yes, sir. To furnish millions, I have not. I don't think it is necessary.

The CHAIRMAN. Well, you understand if the Government accepted your bid you would enter into a contract by which you would agree to take charge of the construction, for instance, of the dams down there.

Mr. STERN. Yes, sir.

The CHAIRMAN. Have you had experience in that line?

Mr. STERN. Yes, sir.

The CHAIRMAN. Where?

Mr. STERN. In the North. I have done all kinds of building. I used to secure water powers.

The CHAIRMAN. What great water power project have you had charge of?

Mr. STERN. None. I have owned part of water powers in the North, but I had nothing to do with the actual building of the projects.

The CHAIRMAN. Your letterhead describes you as a consulting engineer. What experience have you had as an engineer?

Mr. STERN. I have always been acting on my own account. I have never had a job in my life with anyone. Whatever I have done I have always done on my own account.

The CHAIRMAN. Acting on your own account, what projects have you constructed or had under your charge when they were constructed?

Mr. STERN. I have erected buildings. I have owned a water power.

The CHAIRMAN. Where?

Mr. STERN. In Ontario.

The CHAIRMAN. Did you construct it?

Mr. STERN. No, sir.

The CHAIRMAN. How big a one was it?

Mr. STERN. It is a very large one, but it was sold. I sold it, and I didn't pay any attention to it afterwards.

The CHAIRMAN. You have not had any experience in construction of dams, have you, on large scales?

Mr. STERN. No; but I have been living on them for 10 years or more. I know all about them. I was not actuated by any desire to make money, and I never engaged in anything of that kind. I have bought them and sold them and made a business of it. I have been interested in my own chemical work for years.

The CHAIRMAN. I suggest, Mr. Stern, that you insert in the record a copy of your bid. This is a letter directed to me as chairman of the committee. I have your original letter here, and I judge you have a copy there in your hand.

Mr. STERN. Yes, sir.

The CHAIRMAN. Have you another copy?

Mr. STERN. No, sir.

The CHAIRMAN. Maybe I had better read it.

Mr. STERN. I can pass this around.

The CHAIRMAN. It will take less time to read it.

(The chairman read the proposal referred to as follows:

[Manufacturer of chemical and industrial products. L. Stern, consulting engineer. Chemicals, oils, mineral products.]

BALTIMORE, May 12, 1922.

DEAR SIR: We herewith propose to lease from the Government the Muscle Shoals power project for a term of 25 or 50 years or such other time as may be agreeable on the following conditions:

1. The plants to be completed under our supervision at Government cost; 4 per cent interest annually to be allowed the Government on amount necessary for completion.

2. A valuation to be placed on the work already done based on what would have been the average cost during the period from 1904 to 1914, and this sum to be repaid the Government at the rate of 2 per cent per annum, besides \$55,000 annually for maintenance of navigation locks.

3. The power obtained to be used in the manufacture of fertilizers to such an extent as may be feasible and in the manufacture of electro metallurgical products: 110,000 tons fertilizers to be sold at cost of production; in case of war plants to be immediately converted for manufacturing war materials which shall be sold to the Government at prevailing prices; any surplus power to be sold direct to users or to power distributing companies.

4. In addition to the above-named payments, 60 per cent of all net profits derived from the operation of the plants to be paid to the Government, and 40 per cent to us.

The above is only a rough outline in general terms of what we propose.

Our proposal allows the Government for all monies expended, gives the farmers 110,000 tons fertilizers at cost, and gives to the Government a large percentage of all profits derived, with the benefit of private operation.

If you wish to see us in regard to the matter we would be pleased to call.

Yours truly,

The CHAIRMAN. You have not seen these dams, have you?

Mr. STERN. No, sir; I have not. First of all, I desired to find out exactly what the committee wants; secondly, if I saw the plans, etc., it probably is not necessary for me to see the dams, as I am familiar with this kind of work. At present I have only a rough outline of the plans.

The CHAIRMAN. Do any other members of the committee want to ask the witness any questions?

Senator KEYES. Mr. Stern, what about this Ontario property. Can you not give us some idea as to how much of a proposition that was, how large a water power it was, and what has been done with it?

Mr. STERN. Yes sir. That has been developed. I left there shortly afterwards. I really had a half interest in it, and it was the other man who sold it to the power company.

The CHAIRMAN. How long ago was this?

Mr. STERN. Well, before the war. In 1912, I think.

Senator KEYES. Whereabouts in Ontario was it?

Mr. STERN. In northern Ontario, in the cobalt region. I lived there for two years. I lived around Montreal for ten years.

Senator KEYES. Was that a 50-horsepower?

Mr. STERN. Oh, yes, it was larger than that. It was a large water power.

Senator KEYES. How large?

Mr. STERN. That I can not say. Probably 50,000; 50,000 to 100,000.

Senator KEYES. What stream was it on?

Mr. STERN. The Montreal River, a very powerful stream.

Senator KEYES. How big a dam was it?

Mr. STERN. Not such a big dam; probably 200 feet.

Senator KEYES. How high was the dam?

Mr. STERN. I don't remember what fall.

Mr. KEYES. Have you seen the dam?

Mr. STERN. No sir, I haven't seen the dam. It was finished after I left. I got rid of it at that time and I can not give you the details of it. I am familiar with the water powers, though, in Canada. I lived there for 10 years.

Senator KEYES. What other water powers are you familiar with?

Mr. STERN. I know Niagara, and I know the falls around Montreal. I lived at Montreal for 10 years. I have been at the falls of Three Rivers, and I have been at Montmorency, I was interested in buying water powers at one time, and I kept track of what was going on throughout northern Ontario. I am familiar with the water powers of north Ontario which a lot of people don't know anything about, on rivers which flow into Hudson Bay.

There is this further consideration. This is a big scheme but most people are attracted only by its magnitude, while they do not comprehend what an exceedingly important matter it is in our water power development.

During the past generation industrial supremacy has been with the nations that possessed black coal; during the coming generations it will be with those who have white coal, and here in the States you will be compelled to compete with Canadian water powers.

Most of us are familiar with the water powers that empty into the St. Lawrence. You know Niagara. You know Montmorency, and you know Three Rivers, but most people are not acquainted with the tremendous water powers in the Province of Quebec, within 75 miles of the United States border line, where there is one of over 500,000 horsepower.

Senator KEYES. What one is that?

Mr. STERN. I don't even recall the name. I think it is on the Bersimis River, is it not?

Senator KEYES. I don't know. I was asking you.

Mr. STERN. I don't recall the names. They are Indian names and hard to remember. For instance, in northern Ontario, flowing into Hudson Bay there are a number of powerful rivers. One has been developed with an original horsepower of 45,000. I believe that has been increased since to 100,000 horsepower.

It is necessary, in order to compete with other nations, that the water powers of the United States be developed as economically as possible, that they be not saddled with large issue of bonds, etc., thus preventing the country from getting the benefit of cheap power.

Even this last week private interests have secured control of the water power on the Susquehanna River, and application has been made to the Public Service Commission of Maryland to issue \$20,000,000 of bonds to cover cost of development. The engineer of the commission estimates the cost of development will not be over \$7,000,000. That means they wish to issue \$20,000,000 worth of bonds to cover \$7,000,000 of cost, and the people will pay interest on those \$20,000,000 indefinitely. Not only that, when they come to make the rates, being allowed to earn 6 per cent they will not as 6 per cent on the bond issue; they will consider the bond issue as part of the capital cost and they will ask interest on the stock which they probably will issue and sell all over the country, and thus obtain thousands of supporters who will help them to get a rate which will give them interest on all that stock.

Senator KEYES. As I understand you, you feel that a capital of \$10,000 would be adequate to go on with this proposition?

Mr. STERN. No, sir, I don't. It would take more than that to carry on this project. I think a capital of \$10,000 will be adequate for purposes of incorporation.

The CHAIRMAN. You are going on the theory that the Government puts up the money?

Mr. STERN. Yes, sir; the Government puts up the money for completing the plant.

The CHAIRMAN. Yes.

Mr. STERN. Yes, sir.

The CHAIRMAN. So that it would not need any great expenditure of money?

Mr. STERN. Considerable money will be needed. I have not told you what I had in mind when I made this proposal. First of all, there were to be manufactured

110,000 tons of fertilizer material, or whatever quantity should be required to meet the military necessities of the United States. That gives the United States an operating arsenal without expense to the United States and which will pay its own maintenance costs.

Secondly, I intend to put cheap power in every farmhouse within 150 miles of Muscle Shoals; not only for the purposes of household uses, but for running light machinery and for general agricultural purposes.

In northern Europe, Norway and Sweden and some of the other countries, they are developing their powers, not for electrical power purposes but for agricultural purposes. It was found by subjecting crops to electrical treatment—and it has been practically developed—you can take hay, corn, cotton, and double their production by subjecting them to electrical treatment, and there is no reason why this should not be done in the United States.

The CHAIRMAN. Is that being done anywhere?

Mr. STERN. Yes, sir; it is being done to-day.

The CHAIRMAN. In Norway?

Mr. STERN. Yes, sir; and I think in Sweden and Switzerland.

The CHAIRMAN. How do they apply the electricity?

Mr. STERN. In northern countries like Norway and Sweden, there is in the fall of the year considerable fall of moisture and the crops often rot before they can be gathered. To prevent this loss the crops are treated electrically. The arrangement is very simple. The farm products are placed between two metal plates to which wires are attached, by means of which an electric current is passed through them. The exact action is not understood, but it is believed that the current kills the bacteria. Anyway, it has been found over an experiment of two years, that the crops can be easily doubled. Not only that, the farmers can be assured of their crops.

Thirdly, I had in view an industrial development to use whatever power was available; for building up a large general industrial community and not have the power tied to one interest which, when times are dull, might be affected adversely and perhaps be under the necessity of closing down.

The CHAIRMAN. Do you expect to build the industries or sell the power to somebody else?

Mr. STERN. No, sir; I expect to allow these industries to build themselves and buy the power.

The CHAIRMAN. The profit you expected to make out of it was by the sale of the power?

Mr. STERN. By the sale of the power; perhaps also manufacturing myself. But that was not part of my plan. I think every ampere of power than can be generated there can be disposed of immediately.

Senator KEYES. Have you had experience in manufacturing industries of any kind?

Mr. STERN. Yes, sir; I am a manufacturer.

Senator KEYES. Of what?

Mr. STERN. Chemicals; and I make Government supplies. I make mail bags for the Post Office Department.

Senator KEYES. Mail bags?

Mr. STERN. Just now, yes, sir; and I furnish coal and oil to different departments.

Senator KEYES. Where is your factory where you make mail bags?

Mr. STERN. In Baltimore.

Senator KEYES. How large a factory is it?

Mr. STERN. It is small. I employ about 30 men. It all depends on the orders I get.

The CHAIRMAN. Where do you supply coal and oil now?

Mr. STERN. I came over here this morning and offered to furnish coal to the Public Health Service.

The CHAIRMAN. Where do you get your coal? Do you mine it? Have you a coal mine?

Mr. STERN. No, sir; I have no coal mine. I buy from coal operators. I get coal from various sources—from Kentucky and from Tennessee, around Coalville, and from Pennsylvania. The same with oil. I buy oil.

Senator HEFLIN. Mr. Stern, are you interested in any power concern in the United States?

Mr. STERN. No, sir; I have no connection with any power concern in the United States.

Senator HEFLIN. Or any fertilizer manufacturer?

Mr. STERN. No, sir; and no banking interests. I came here on my own responsibility. I have done business with them, but I came here absolutely free and absolutely untangled, exactly as I have stated. I have approached nobody and have

spoken to nobody. Newspaper people have been pressing me and I have refused to give them any information.

Senator HEFLIN. You would just like to have Muscle Shoals, though?

Mr. STERN. I would like to have it on any reasonable terms, and I leave it to you gentlemen to say what are reasonable terms. My terms are not like the laws of the Medes and Persians, nor like the fourteen points. You can change them any way, so long as you do it in a reasonable manner.

Senator HEFLIN. Any way we think it will be satisfactory to you?

Mr. STERN. What is that?

Senator HEFLIN. Whatever we do to them they are satisfactory to you?

Mr. STERN. Not necessarily. I suppose you, as reasonable men, will be just to me and just to the Government.

Senator HEFLIN. Mr. Ford has got a pretty good offer in there, hasn't he?

Mr. STERN. I don't see that he has any better than anybody else. I did not come here to attack anybody. I was not sent here to attack anybody. I came here simply actuated by the motives which I have stated.

The CHAIRMAN. All right, if that is all.

Mr. STERN. If there is anything else you would like to ask me, I would be glad to answer, if I can.

STATEMENT OF MR. CHARLES H. MacDOWELL.

Mr. MacDOWELL. My name is Charles H. MacDowell. I am president of the National Fertilizer Association and president of the Armour Fertilizer Works. During the war I was director of the Chemicals Division of the War Industries Board and personally handled the problem of our nitrate supply. I was also technical economic adviser to the Peace Commission in Paris. I am president of the Western Society of Engineers and a member of the Federated Engineering Council of Washington.

I mention these activities to indicate that I have had opportunity to become familiar with the national needs for nitrogen.

The CHAIRMAN. Are you a chemist, Mr. MacDowell?

Mr. MacDOWELL. No, I am not a chemist nor am I an engineer, but I have received the honorary degree of doctor of science from the University of Pittsburgh for accomplishments in industrial chemistry, and I am on the committee on chemistry of the board of overseers of Harvard University.

The CHAIRMAN. How long have you been connected with the fertilizer industry?

Mr. MacDOWELL. I started the fertilizer by-product department of Armour & Co. in 1894. It has been my work to develop some of the by-product savings in the packing industry, and that branch gradually has expanded into a large fertilizer and general chemical industry.

The CHAIRMAN. Were you engaged in the fertilizer industry prior to that?

Mr. MacDOWELL. No; I entered the service of Armour & Co. as a young man. I came from down State in Illinois. I became interested in fertilizer, and Mr. Armour, sr., put me at that work, so all my business life has been in the development of that industry, saving the waste products of the packing house.

The CHAIRMAN. You say you are president of an organization of fertilizer people?

Mr. MacDOWELL. Yes, sir.

The CHAIRMAN. What is the organization?

Mr. MacDOWELL. The National Fertilizer Association is an organization composed of nearly all the fertilizer manufacturers of the United States, both North and South, including Hawaii.

The CHAIRMAN. What is the object of that organization?

Mr. MacDOWELL. The association is what we call a service organization. It maintains an educational bureau for the dissemination of information that the various State chemists and agricultural experiment station workers develop; for educating our own members as to the educational and practical side of fertilizers and their use; to meet with the various educators in formulating better ways of manufacturing and selling fertilizers; and engaging in all of these service activities which will help the farmer and which naturally will help us in carrying on our business to better advantage and making it a higher grade and more efficient industry.

The CHAIRMAN. How many organizations, corporations, and partnerships, etc., are there in your national association?

Mr. MacDOWELL. I do not recall exactly, but I think there are about 150 manufacturers of complete fertilizers, and probably as many more, or nearly as many more, companies that manufacture fertilizer materials or machinery or those things which tie into the general industry.

The CHAIRMAN. How often does that association meet?

Mr. MACDOWELL. The association has one meeting each year, an annual convention, and it has an executive committee which meets generally twice a year, once at the convention and once during the interim.

The CHAIRMAN. You have some salaried officials, do you?

Mr. MACDOWELL. We have a secretary in Philadelphia and also Mr. Tierney, who is here maintaining our Washington office. The association also looks after the railroad and power needs of the members; it has an insurance bureau working on insurance methods and—

The CHAIRMAN (interposing). It is a sort of clearing house, as I take it.

Mr. MACDOWELL. Well, it is a service or helpful association. It has nothing whatever to do with prices or with those trade questions which a good many associations attempt to handle more or less.

The CHAIRMAN. The persons or corporations who compose this association are all competitors, are they?

Mr. MACDOWELL. Yes, sir.

The CHAIRMAN. What information does that association convey to its members? What kind of information? What is the service it renders?

Mr. MACDOWELL. Well, it gives them information, for instance, on insurance matters. It gives them information with regard to the proper use of fertilizers, the manufacturing of them, and general matters of that sort.

The CHAIRMAN. Well, now, if you, as president of the Armour Fertilizer Works—and I suppose that is one of the members of the national association?

Mr. MACDOWELL. Yes, sir.

The CHAIRMAN. Now, as president of that organization if you should discover some new method of manufacturing fertilizer or cheapening your method of doing it, would you communicate that to the other members of the national association?

Mr. MACDOWELL. No; not necessarily; we might. I, myself, have always gone on the theory of helping our competitors and helping the industry as much as we could. If there are new developments or new processes which come up, I tell them of it, so far as my own personal attitude is concerned, but the association itself maintains no research facilities. If any research work is done it is done by the different members of the association at their own expense. I mean technical research.

The CHAIRMAN. That is what I was getting at.

Mr. MACDOWELL. It is a service association.

The CHAIRMAN. When you obtain any information of that kind you tell the other members what it is?

Mr. MACDOWELL. Yes; although that is not a part of the purpose of the association. We might or we might not. But anything of general interest we would advise them.

The CHAIRMAN. Is that usual with people engaged in a competitive business, that they convey to their competitors any improved methods that they discover?

Mr. MACDOWELL. We would not convey to them any secret methods, for instance, which we discovered. We would not do that. But there are virtually no secrets in the fertilizer industry. If there should be some published developments which are of interest to all—and some of our members are not technical and do not know about them—we might tell them of that. But we do not aim to do anything of that kind. That is not a part of the association's work.

The CHAIRMAN. Has there been competition in the fertilizer business?

Mr. MACDOWELL. Extreme and unlimited.

The CHAIRMAN. Did that bring about any feeling of any kind between the members of this association?

Mr. MACDOWELL. Yes, natural feeling that competitors have in business.

The CHAIRMAN. When you meet annually, or when the executive committee meets, at the meetings do they have a controversy?

Mr. MACDOWELL. Nothing special, because we have always kept away from those trade questions.

The CHAIRMAN. What does the association do? What does this committee do?

Mr. MACDOWELL. As I told you, they spend quite a little money in this educational work. We maintain these other bureaus and study methods of analyzing fertilizers, working with the official agricultural chemists and developing better methods of analysis, and so on.

The CHAIRMAN. It is for the benefit of the whole trade?

Mr. MACDOWELL. That is for the benefit of the trade; yes, sir.

The CHAIRMAN. Do you convey that information to the fertilizer people who are not members of your association?

Mr. MACDOWELL. Practically all of the results are published in the American Fertilizer and the Southern Commercial Fertilizer, and all members of the industry get the information, whether they belong or not.

The CHAIRMAN. You say practically. That modifies it somewhat. How near does that mean to all?

Mr. MACDOWELL. We do not publish our minutes, but we publish our general proceedings. All of our convention proceedings are published.

The CHAIRMAN. But what I am trying to get at is if you discover something to help the fertilizer business and you communicate it to those other members, would it likewise be communicated to fertilizer people who were not members?

Mr. MACDOWELL. Why, I fancy so. But if we ourselves discovered anything that was of great importance to ourselves, I don't know that we would publish it. We are no different from any other manufacturing concern. But what I do mean is that we have not tried to be secretive. There is more or less secrecy in all business—most of it unnecessary, as a matter of fact. We have not tried to be especially secretive, but if we develop anything new we patent it, and if it is useful we make use of it. We are not giving everything away. I don't mean to convey that idea. But in the development of better uses for fertilizer materials and things of that sort we give out some of that information or not, just depending on how we feel about it.

The fertilizer association is and always has been largely a social organization, making much of the social features of the annual convention. We also give service to our members, which has distinct value, in advising them of better methods in the preparation of fertilizer. The association maintains fellowships in some of the colleges to study how fertilizer can best be applied, what kind of machinery is best suited for its application, how near the roots it should go, whether under or above or both, and all that. When these fellowships conclude their work the results are all given to the public, and that includes manufacturers of fertilizer distributing machinery and all those to whom the knowledge has special interest.

Senator KEYES. What proportion of the fertilizer output is represented in your association?

Mr. MACDOWELL. I would say probably of the manufacturers of fertilizers about 90 per cent. It is quite representative of the industry as a whole.

The CHAIRMAN. Now, go on in your own way, Mr. MacDowell.

Mr. MACDOWELL. The fertilizer industry has, as I recall, about 600 plants. Those plants vary in size from 5,000 tons capacity a year to say 200,000-tons capacity a year.

Senator NORBECK. May I ask one other question? You put out a complete fertilizer, do you?

Mr. MACDOWELL. We put out anything the farmer wants; complete fertilizer, fertilizer materials, acid phosphate, whatever he needs. The part of the business that is done as complete fertilizer is the larger part.

Senator NORBECK. What per cent of the business does Armour & Co. do?

Mr. MACDOWELL. The Armour interests I would say, do about 8 per cent of the United States fertilizer business.

Senator NORBECK. Eight per cent?

Mr. MACDOWELL. Yes, sir.

Fertilizers are made in manufacturing plants during all the year. The fertilizer industry is the largest of the heavy chemical group, and ordinarily makes or buys about two and a half million tons of sulphuric acid. Fertilizer manufacturers buy or mine phosphate rock, grind it and make acid phosphate, which is the basis of the fertilizer used in the country. That ingredient is lacking in most of our soils, perhaps to a greater degree than any other of the essential ingredients. It is made every day, cured and put in good mechanical shape. Where complete fertilizers are made, the nitrogen and potash are combined with acid phosphate, stored, cured, and at the time of shipment packed in bags and shipped out in cars either as straight or mixed brands. The business is shipped out in the spring in approximately 90 days. In the fall the shipping period is a little over two months.

The plan on which the business has been developed is to send the concentrated materials such as rock, sulphur, ammonia, and potash, to plants averaging perhaps 25,000 or 30,000 tons capacity, and shipping the completed product out within a few miles of the plant. Broadly speaking, the industry produces very little nitrogen itself. That material is bought in the market. The nitrogen that is produced is largely nitrogen converted from industrial waste, such as leather scrap, old felt hats, hair, waste and materials of that kind which are processed to make the nitrogen available.

Sugar beet slops and other industrial waste also is used. Some factories use tankage from city or packing house rendering, and in the South certain manufacturers use cotton-seed meal in their goods, especially off meal.

Packing-house materials and cotton-seed meal are going more and more into cattle feed, so that that source of supply is decreasing as far as the fertilizer industry is concerned.

The industry gets much of its nitrogen, aside from the organic forms, in the form of nitrate of soda and sulphate of ammonia. The nitrate is imported from Chile and the sulphate of ammonia comes from the coking plants.

Prior to 1914 the United States imported ammonium sulphate, but with the increased production coming from war development there now is exported a considerable tonnage. Our agricultural interests are not taking all the ammonium sulphate now being produced here.

The CHAIRMAN. Where is it produced?

Mr. MACDOWELL. At all of the metallurgical centers and in cities where gas is made.

There is considerable misunderstanding on the part of the public as to the different forms of nitrogen used in the fertilizer industry. The production of ammonium nitrate at Muscle Shoals has given rise to the erroneous impression that this plant will make the nitrates which the farmer has been accustomed to using—that is, nitrate of soda. This plant will not make that form, and the ammonium nitrate form is not suitable for mixing or blending in fertilizers, so that there is very little outlet for it in that form for agricultural purpose.

The CHAIRMAN. Ammonium nitrate, you say, it is not practical to use in the manufacture of fertilizer?

Mr. MACDOWELL. It is hygroscopic. It draws water. It is sticky and is very concentrated, and it is quite difficult to blend it evenly through a ton of fertilizer and keep the fertilizer dry and friable so that it will drill well in the fertilizer drills through which a great deal of our fertilizer is applied.

The CHAIRMAN. Does that mean that this plant No. 2 could not be utilized, in your judgment, in the manufacturing of a fertilizer ingredient?

Mr. MACDOWELL. No; I would not say that; but they would probably have to make sulphate of ammonia, the commercial form which the fertilizer industry is accustomed to using.

The CHAIRMAN. In getting it out of the air would they get sulphate of ammonia before they get ammonium nitrate, or would it be the other way?

Mr. MACDOWELL. In the making of ammonia through the cyanamid process at Muscle Shoals, they mix lime and coke, treat it in an electric furnace and make an intermediate product known as cyanamid, which is alkaline, and which can not be used in greater amount than 50 or 60 pounds per ton of complete fertilizer. If more than this proportion is used, it being so alkaline, it causes the phosphoric acid to revert and it releases ammonia, too. In order to get this nitrogen in shape for war purposes they treat it in caustic solution in a pressure tank and decompose it and ammonia gas comes off. That ammonia gas is the same form as you get in coking coal. Nitrogen is in coal, and when coal is coked part of it comes off as ammonia gas, and is recovered. So when they produce ammonia gas they either make aqua ammonia out of it through water absorption or passing the ammonia through a bath of sulphuric acid and make sulphate of ammonia. The sulphuric acid fixes it in the form of sulphate of ammonia, the form of ammonia the fertilizer manufacturer uses, inorganic ammonia.

The CHAIRMAN. It is just as easy for that plant to make it in that form as the other, is it not?

Mr. MACDOWELL. Making it into ammonium nitrate requires an expensive plant. This plant is already built at Muscle Shoals. There is no sulphate of ammonia plant there. This would have to be constructed.

The CHAIRMAN. In your judgment in getting fertilizer down there it would not be proper to make ammonium nitrate at all?

Mr. MACDOWELL. No. My judgment is that sulphate of ammonia might be made. However phosphate rock might be volatilized and made into a solution and the ammonia fixed in that instead of in the sulphuric acid, which then would produce ammonium phosphate.

The CHAIRMAN. When they get it in the form of sulphuric acid they later have to take the sulphuric acid out?

Mr. MACDOWELL. No. When fertilizer containing sulphate is applied the sulphates are often useful themselves. Sulphate of ammonia is worked on by bacteria in the soil and the ammonia is converted into a nitrate by the bacteria, and taken up by the plants.

The CHAIRMAN. Don't you have to be careful in making fertilizer not to get too much sulphuric acid in it?

Mr. MACDOWELL. In making acid phosphate we aim to get the greatest use out of the sulphuric acid. In converting phosphate rock into water-soluble phosphoric acid—all of these products are slightly acid, but they ordinarily contain only about 1½ per cent of free acid.

When fertilizers are applied, the soil waters dissolve the phosphoric acid and the solution impregnates the soil. The salts of the soil neutralize the acids and hold the phosphorus until the plant uses it, so that there is practically no leaching. There used to be a feeling that acid fertilizers were not good for the soils, but this opinion is changing. It is a part of good farming to keep the soil sweet by liming and cultivating.

The fertilizer industry is not opposed to the development of the Muscle Shoals water power. It believes that the development should be made along sound engineering lines and that the power, when developed, should be used for the best interests of that locality. The industry questions the public policy of turning the power and its control over to an individual for as long a period as 100 years; but if the project is developed at Government expense it does not think that it is a good thing for the locality for one man to be able to dictate what kind of an industry should be developed in that particular section. Moreover, the fertilizer industry does not favor the Government's building new plants for private individuals to use for their personal advantage to compete unfairly with industries not so fortunately subsidized.

If the Government develops this power and improved methods of making fertilizer by power are developed, which is always possible, the industry feels that such of their members as may want to use that power to make fertilizer should have equal opportunity in making use of it.

I personally suggested to Mr. Swann at Anniston that he start the experimental work he has done so well in the smelting of phosphate rock. We wanted phosphorus during the war, and he had equipment which it seemed to us might be used to make phosphorus cheaper than by building a new plant. Later we encouraged him to undertake this new work when the armistice was signed. During that period I suggested to him that he also try to make some phosphoric acid, and potash because we needed those ingredients and there were some raw materials containing some potash near there. He has done fine work. I think there is a probability of making phosphoric acid in that region by the smelting process a little cheaper than by the acid process. However, I think I can make a concentrated superphosphate in Tampa by the acid process as cheaply as it can be made at Muscle Shoals, and it is a better point for distribution. These are all new developments and should be followed up. Our own company has done a good deal of research work along those lines, trying to find cheaper and better ways of making fertilizer. But the industry does not feel that it would be good public policy to give Mr. Ford a monopoly of the power and its utilization over a long period of time. Further, it questions when there is a surplus of the particular form of nitrogen that would be made there, whether it is good business to make more of it, as we are dependent now and probably will be for some time, on foreign outlets to take care of the surplus we are now producing.

The CHAIRMAN. Your contention is we have more nitrogen now than we need?

Mr. MACDOWELL. No. My contention is that we have more nitrogen in this form than we use. I think we ought to use a good deal more than we do.

The CHAIRMAN. The only way to get a large use, then, assuming that is correct, would be to cheapen it, would it not?

Mr. MACDOWELL. Yes; but this method of Mr. Ford's will not cheapen nitrogen as compared with the coke-oven method of making it, because they get theirs for practically no cost outside of the acid, whereas Mr. Ford would have to mine a lot of lime and coal, use transportation and power, and his costs would be greater.

The CHAIRMAN. Do you buy from those people in making fertilizer?

Mr. MACDOWELL. Oh, yes.

The CHAIRMAN. What does it cost you?

Mr. MACDOWELL. The present market—I would say we have not any contract at the moment—is around \$3 per hundred pounds. Six months ago it was down to \$2 per hundred pounds.

The CHAIRMAN. For what?

Mr. MACDOWELL. Sulphate.

The CHAIRMAN. Sulphate of ammonia?

Mr. MACDOWELL. Yes, sir. It was selling quite freely here at \$40 a ton, delivered at coast points. Recently there has been some advance, but we are over the spring season and the price will sag. It will probably land around \$50 a ton.

We figure that it would cost Mr. Ford, aside from power costs, around \$55 a ton to make.

The CHAIRMAN. Then he won't hurt you any?

Mr. MACDOWELL. No, he would not on that end of it. He would be merely adding to a surplus which now exists. We hope that surplus won't exist very long. The fertilizer industry wants the farmer to use nitrogen. The trouble with the fertilizer industry to-day is that it has a ten million ton manufacturing capacity and five million tons of business.

The CHAIRMAN. Don't you think it is because it costs so much to the farmer that he does not use more?

Mr. MACDOWELL. No.

The CHAIRMAN. Why is it that he does not use more?

Mr. MACDOWELL. Because he is cutting out everything that he can avoid buying. He has been through terrible times, and is effecting every economy he can. This is one of the things that takes hard money out of his pocket, and unless he is thoroughly convinced that it will make him money, he says, "I will wait until next year." We have had a big trucking trade this year. In fact we have had as big a trade with the truck farmers along the coast and down the gulf as we ever had, and there has been quite a decided increase in the grade of fertilizer used on truck farms.

The CHAIRMAN. That is only one of the expenses that a farmer has to go to in order to produce a crop. Assuming that he does not use enough—and I presume that is a fair assumption; everybody seems to agree with that, even the farmers themselves—assuming that he does not use enough and that there is more to be had, the only reason he does not take more is because of the cost, is it not? He knows he ought to have more.

Mr. MACDOWELL. He knows he ought to have more. Fertilizers this spring, broadly speaking, have been selling below the cost of manufacture.

The CHAIRMAN. I am not speaking of that.

Mr. MACDOWELL. I know that, but those costs are practically down to pre-war costs.

The CHAIRMAN. I understand that. Just assume, for the purpose of my question, that you can not make them any cheaper; it seems to me that it gets back again to the proposition, regardless of whether there is any profit in it, and whether there is no profit or whether there is a loss, if the farmer could get fertilizer cheaper he would use more of it?

Mr. MACDOWELL. Broadly speaking, stable, reasonable prices for fertilizer develop business, and that is what the fertilizer industry wants. The fertilizer industry's best interests are not served by high prices. The fertilizer industry's best interests are served by making in volume goods and cutting their manufacturing costs down.

Senator HEFLIN. Then you agree if the price was lower the farmer would use a great deal more than he does?

Mr. MACDOWELL. That depends on whether he thought it was going lower still. In other words, we must have a stabilized price that the farmer thinks is fair, and if the farmer thinks he can afford to use the fertilizer at that price he is willing to buy. The willingness of the farmer to buy is the psychology, of course, of the consumption of fertilizers, if he thinks that they will profit him in their use. If he can be shown that, he is a willing buyer.

Many of our agricultural experts say that the farmers in the grain sections should go still further with legumes, with clover and with those plant forms of fixing nitrogen the so-called restorative crops before buying nitrogen. I think there is a good deal in it, but perhaps they are a little extreme. But that is what they are telling their people. They say the first thing to be used is phosphoric acid, because the soil is more deficient in that than in nitrogen. Then as the soil is built up in phosphoric acid, some of the restorative crops should put in and nitrogen be obtained in that way.

Senator NORBECK. Do they go so far as to say that nitrogen can be secured from the growing of certain crops, and that with careful farming there is no need to purchase nitrogen?

Mr. MACDOWELL. Yes; and they say this, and rightfully, too, that the farmer, until he works the soil up to a certain fertility, until he develops those methods which go with proper rotation and liming and balancing up by adding the more needed element, like phosphorus, for instance—until he gets his soil balanced he should not go into heavy fertilization. That is their theory, and of course, it is true to quite an extent, because merely to put fertilizer on the ground does not bring the crop. You have got to work and use your head and do all those things which go with good farming, as well as to feed the crop properly. The fertilizer business is the same as feeding cattle. A crop should be fed a balanced ration, just the same as cattle are fed. In using fertilizer it is important to know just what it is, and the farmer's concern is to get it right.

Senator NORBECK. Is it likely that the farmers are putting as much fertility back into the soil by crops as by fertilization?

Mr. MACDOWELL. I fancy more nitrogen. Our use of commercial fertilizers is not heavy. I presume, as near as I can figure, we are using 140,000 tons of nitrogen in commercial fertilizers a year. Germany alone this year will use, would you say, Major, 400,000 tons?

Major BURNS. I think 500,000.

Mr. MACDOWELL. Five hundred thousand tons on a bit of ground not so large as Texas.

Senator NORBECK. They, of course, have their soils in better shape than we have. They are more careful farmers and have a better location.

Mr. MACDOWELL. Yes; and they farm intensively. We still farm extensively, except in some of our trucking regions.

Senator NORBECK. In other words, they are getting all the use they can out of nitrogen in producing plants?

Mr. MACDOWELL. Yes; and they make their nitrogen at home. Theirs is such a small country, and their need is to make as big crops as they can, the same as other countries do. So they resort to fertilization on a basis way beyond anything that we do here, except in a few trucking regions. In Aroostook County, Me., for instance, we fertilize on our potato crop just as heavily as they do over there.

We have counties in the South that fertilize very heavily. Marlborough County, in South Carolina, and several other counties.

The CHAIRMAN. What do they produce?

Mr. MACDOWELL. Cotton, truck, tobacco, and rotation crops. They are very fine farmers.

Senator NORBECK. It is a fact that the Germans, in spite of their intensive farming and proper rotation and intelligent handling of the soils over a long period of years, are still unable to get along without the commercial fertilizer, which means that even with the best of farming you can not get away from the purchase of fertilizer?

Mr. MACDOWELL. You can not. Germany went up from around 18 to 20 bushels per acre average for wheat under the old methods to 32 bushels per acre average for wheat under intensive fertilization. Belgium got up to 37 or 38 bushels average per acre on wheat.

Senator NORBECK. To what extent is that due to farming and to what extent is it due to the use of more commercial fertilizer?

Mr. MACDOWELL. The French Government reports that on rather intensive farming 70 per cent came through fertilization and 30 per cent through better tillage and better seeds. The German report was almost the same. I think you can safely say that fully 60 per cent of the big increase in the crops of western Europe in the last generation or generation and a half has come from the use of commercial fertilizer.

The CHAIRMAN. Mr. MacDowell, it is your estimate that in Germany alone they use 500,000 tons of nitrogen?

Mr. MACDOWELL. That is Major Burns's estimate, and I think that is about right. Of course, it is a little hard to tell how much of the nitrogen they use over there goes into fertilizer. For instance, we make in the United States in our coke ovens 100,000 tons, I think we figure, of nitrogen. Only about 30,000 tons of that 100,000 goes into domestic fertilizer.

The CHAIRMAN. How much in Germany goes into fertilizer?

Mr. MACDOWELL. It would be rather difficult to say, but my estimate was that fully 400,000 tons of their production went into fertilizer.

The CHAIRMAN. Now, we have a total consumption here, you said, of 140,000 tons of nitrogen?

Mr. MACDOWELL. A consumption in fertilizer, I would say, of about 140,000 tons. It is a bit of a guess, but it is based on averages, and it ought to work out fairly well.

The CHAIRMAN. How much surplus have we that we could put into fertilizer besides 140,000 tons?

Mr. MACDOWELL. Of course, part of this 140,000 tons is nitrate of soda which we bring in. We can bring in any quantity of that.

The CHAIRMAN. We do not produce that 140,000 tons?

Mr. MACDOWELL. No; we are both importers and exporters of nitrogen. It is rather a singular thing, but we are bringing in nitrate of soda all the time and are exporting sulphate of ammonia. The nitrogen in nitrate of soda is predigested and goes into the crop immediately. Occasionally within 48 hours after its application one can observe its effect in a deeper green color in the plant. For trucking crops and for crops in light soils, in soils deficient in organic matter, nitrate of soda is, I would say, two to three weeks quicker in its action than nitrogen which you get from sulphate of ammonia. So that there is a decided preference on the part of the truck farmers and of farmers in the sandy soils to use their nitrogen in the form of nitrate of soda rather than in the form of sulphate of ammonia. It is a question of time.

The CHAIRMAN. What I am trying to get at is, if Germany uses so much fertilizer in a little plot smaller than one State over here, it seems to me it shows, or has a tendency, at least, to show, that we are way below what we ought to be in the use of the fertilizer in our country.

Mr. MACDOWELL. Of course, in the fertilizer industry we feel that way, and we have felt that way.

The CHAIRMAN. You still say there is so much nitrogen here we have more than we need?

Mr. MACDOWELL. We are not using it. Our farmers do not buy it. They are using a little more nitrogen this year than they did last year, because they are feeling a little better, and they saw that their small use last year was not profitable for them, and they are using a little more, calling for more units of nitrogen in a ton than last year.

The CHAIRMAN. As a matter of fact, if the farmers used the fertilizer they ought to, there would be a shortage of nitrogen, would there not?

Mr. MACDOWELL. Yes, sir.

The CHAIRMAN. According to your figures?

Mr. MACDOWELL. We would have to go to Chile and get more of that particular form; we can import from Europe. Then we could start manufacture in this country, and we would naturally have increased recovery from coking plants as they increase in numbers, plants making coke for metallurgical purposes or for domestic purposes—smokeless coal.

The CHAIRMAN. Ought we not to encourage from any source increased production of fertilizer ingredients?

Mr. MACDOWELL. Yes.

The CHAIRMAN. And get as much as we can of them, at least up to a good deal more than double the present output of fertilizer?

Mr. MACDOWELL. We should do it just as fast as we can, but we can not do it too rapidly. I mean there is no sense in doing it long before the fact, because as we stand to-day here in the first three months of this year we exported 58,641 tons of sulphate of ammonia.

The CHAIRMAN. How much did we import?

Mr. MACDOWELL. One thousand six hundred and forty-eight tons. That is, sulphate of ammonia. We don't want to confuse that with nitrate of soda.

The CHAIRMAN. How much did we import of nitrate of soda?

Mr. MACDOWELL. Fifty-two thousand and eighty-two tons in the first quarter of 1922.

The CHAIRMAN. We are all agreed, are we not, that the farmers in America do not use enough fertilizer; that they ought to use more than twice what they use now?

Mr. MACDOWELL. Well, they could use more, but they have got to sell—

The CHAIRMAN. If they used twice as much as they do now they would still be under Germany?

Mr. MACDOWELL. Oh, yes. But of course there is the practical question of the disposal of what we grow. If we increase our wheat production, for instance, our exportable surplus, from say 250,000,000 to 600,000,000, which we can easily do, could we sell it?

The CHAIRMAN. You might say, even, that we ought not to use as much as we do, in order that we might not produce as much?

Mr. MACDOWELL. No; or we might say also that we should use only half the ground that we do, because we could grow what we need on half our acreage.

The CHAIRMAN. Yes.

Mr. MACDOWELL. But many people are farming, and they want to continue to farm, and it is proper that they should. So there are questions that come in that are pretty hard to answer.

The CHAIRMAN. If we do not use fertilizer it will soon be that we won't purchase anything in many sections.

Mr. MACDOWELL. Oh, yes.

The CHAIRMAN. I presume that in time that is true in every section of the country.

Mr. MACDOWELL. Oh, yes; there is no question about that, and it is a basic, big problem; but so far as the fertilizer industry is concerned it can serve much better and serve at a lower price if the farmer will use fertilizer up to 80 per cent or 90 per cent of the producing capacity of the plants that exist to-day.

The CHAIRMAN. Yes; I can see that very clearly, but still you can not get away from the fact that there ought to be more fertilizer used, and the farmer himself knows it.

Mr. MACDOWELL. Yes.

The CHAIRMAN. He would like to have more, but can't buy it.

Mr. MACDOWELL. He can buy it, Mr. Chairman.

The CHAIRMAN. He has to pay the price for it.

Mr. MACDOWELL. He can't get something for nothing.

The CHAIRMAN. Of course he can't get something for nothing.

Mr. MACDOWELL. He does not know what fertilizers cost. He may have a wrong impression on that.

The CHAIRMAN. He knows what they cost him. He can figure out himself that in buying fertilizer, even after he gets it, so far as the fertilizer is concerned, he still has a whole lot of risk to run, whether he is going to get anything or not.

Mr. MACDOWELL. Yes.

The CHAIRMAN. And that must be taken into consideration.

Mr. MACDOWELL. Yes.

The CHAIRMAN. When it comes to a point that he reaches that his fertilizer, among other things, costs too much, he does not buy it, of course.

Mr. MACDOWELL. Of course he is not really in position to judge whether the price he pays for his fertilizer is a fair price.

The CHAIRMAN. He is in the best position in the world to judge whether it is a fair price for him. He knows what he is going to produce under ordinary conditions better than you do.

Mr. MACDOWELL. Yes; if he really does.

The CHAIRMAN. Some of them keep books. But if he does not keep books, as some of them do, he knows in a general way.

Mr. MACDOWELL. But they don't generally keep track.

The CHAIRMAN. You might just as well say that he has no way of knowing what he should pay for a cow.

Mr. MACDOWELL. When you consider that the fertilizer industry goes to Chile for nitrate of soda for use in making sulphuric acid; goes to Louisiana and Texas for sulphur, transporting it up to the interior of the country; mines and washes the phosphate rock and dries it and ships it to the plant; buys bags from India, goes away off there to get them; makes acid phosphate and cures it in the plant; goes out and sells it and delivers it to the farmers at a price equal to 45 cents a bushel for wheat, and a big part of that is freight, I think you will realize that they are operating on as narrow a margin as any industry in the world.

The CHAIRMAN. Mr. MacDowell, it seems to me you jump at the defensive before you are attacked. The question I am asking you have nothing at all to do with whether you are making too much money, or whether you represent a trust. I am not asking that.

Mr. MACDOWELL. No. I realize that.

The CHAIRMAN. I realize that you might possibly be operating at a loss and still be selling your product at a price that the farmer could not afford to pay. If that time comes, or when it does approach, it is to your interest as well as to the interest of the farmer to get some method by which fertilizer can be cheapened.

Mr. MACDOWELL. Of course we are working on that all the time, but we have to have the material, and one thing that makes fertilizer cost more than we are getting to-day is the transportation.

The CHAIRMAN. How much has the freight business to do with the cost of fertilizer?

Mr. MACDOWELL. It averages about 35 per cent of the delivered cost.

The CHAIRMAN. That is a little over one-third.

Mr. MACDOWELL. Yes.

The CHAIRMAN. Then when the farmer pays \$3 for fertilizer he is giving a little more than a dollar to the railroads?

Mr. MACDOWELL. Yes. Our freights have gone up an average of about 120 per cent since 1914. Our freight used to be about 15 to 17 per cent of the cost of the fertilizer and the materials about 65 per cent. Of course every thing during these last few years has been all out of balance. You could not tell what anything was going to cost, and everything has been changed. But right now freights are more than 35 per cent of the cost.

The CHAIRMAN. Are they as much as 40 per cent?

Mr. MACDOWELL. I would say 35. Of course the complete fertilizer is more than the acid phosphate alone, because there are some ocean freights and various other factors that enter into the equation, but it is around 35 to 40 per cent. I would say probably that with the very low price of fertilizer it is fully 40 per cent right now.

The CHAIRMAN. Do you know how much nitrate we imported from Chile during the last year.

Mr. MACDOWELL. A little more than 369,000 tons. In 1918, during the war, we imported about 1,800,000 tons.

The CHAIRMAN. We used that for war purposes, mostly?

Mr. MACDOWELL. Yes, most of it went for war purposes, and we took some away from the fertilizers; took it away from the farmers.

In 1919 part of that Government supply was sold and, as I recall, about a million tons was taken. Is not that your memory, Major? Something like that?

Major BURNS. Yes.

The CHAIRMAN. That is in 1919. About what is the normal importation?

Mr. MACDOWELL. The normal is about 700,000 tons, of which about 175,000 tons goes into explosives. Nitrate of soda is the basis of black powder explosives; nitric acid, for dynamite, and different things of that kind, and about 90,000 tons is used normally for making sulphuric acid.

The CHAIRMAN. How much of the imported nitrate from Chile goes into fertilizer?

Mr. MACDOWELL. About 350,000 tons. It is difficult to say accurately, because some of it is sold direct from the importers and some goes from the fertilizer manufacturers.

The CHAIRMAN. How do you explain, if we already have nitrogen in the country more than we need, that so much of it is coming in from Chile?

Mr. MACDOWELL. There are different forms of nitrogen. We need the Chilean form, as it has peculiar uses, and we are bringing it in because we have to use it for certain purposes that are not served by these other forms of nitrogen. We are also using it for various manufacturing purposes. Take the manufacture of black powder—

The CHAIRMAN. I am speaking entirely of fertilizer.

Mr. MACDOWELL. For fertilizer it is used in the making of sulphuric acid, and it is used for quickening truck crops. In Aroostook County, Me., about one-third of the nitrogen for the potato fertilizer is nitrate of soda, one-third sulphate of ammonia and one-third from tankage or blood—organic forms. Experience in that cold country with their late springs proves the need for a form of nitrogen that will get to work right away and will make up for the cold, late spring and give them a crop.

The CHAIRMAN. Can they get that nitrate from the coke ovens?

Mr. MACDOWELL. No; not without great expense.

The CHAIRMAN. Could you get that from nitrate plant No. 2 if it was in operation?

Mr. MACDOWELL. No.

The CHAIRMAN. Why not?

Mr. MACDOWELL. Because it does not make sodium nitrate. It makes ammonium nitrate. I think it would be just about as quick as sodium nitrate if it was in shape to be used, but it must be oiled in order to prevent it from absorbing water, and this slows up its action. You know you must have fertilizers in proper mechanical shape. The farmers often apply this through a fertilizer drill, which is set for 150 pounds per acre or 200 pounds per acre or 300 or 400 pounds per acre. There is nothing that makes a farmer more exasperated than to have a big chunk of fertilizer clog up his drill and to find he has not fertilized some of his ground. Therefore we have to cure the ingredients and blend them in such shape that they won't cake, and that is one of the difficulties in using concentrated form of ammonia. It is difficult to get the material so it will be in good mechanical condition.

There are many practical phases of manufacturing fertilizers and getting them in drillable shape, and of the right availability that do not appear at first sight, but which are practical questions.

The business does not go well through very large plants. It is not a business that can be concentrated too much at one point. Sometimes we have 10 or 12 brands in a car. The trade is shipped in a few months, and it is a big job to get out the tonnage even with many plants.

The CHAIRMAN. It seems to be the opinion of the experts that we have too many brands?

Mr. MACDOWELL. Yes; there is no question about that.

The CHAIRMAN. Is that the fault of the fertilizer manufacturer?

Mr. MACDOWELL. In part, yes. Early in the business goods were sold almost entirely by brands. The names did not indicate the analysis—but had a trademark or emblem. In those days, which are practically past, brands had good will value; but nowadays practically all of the fertilizer is sold by analysis.

The CHAIRMAN. Yes.

Mr. MACDOWELL. 3-9-3, if you sell it in the North, or 9-3-3 if sold in the South. That indicates the chemical analysis, and every body, practically all of the farmers, now know what that means. That has been the development of the last 8 or 10 years in the fertilizer industry. The fertilizer association is working earnestly to bring about reduction in the number of brands and increase in the concentration up to the right point. Those things are not only helpful to the farmer, but to the industry, because it interferes with the operation of the plant every time a change is made in the mixing machine to put in some irregular brand and change it for every 10 bags or so. That procedure costs a lot of money. It would be better if we could ship two or three brands to a car. Then we could be prepared beforehand to get goods out promptly. Such a system would save the fertilizer industry a great deal of money. Those things are all developing as the industry develops, and it is a young industry.

It was growing at the rate of about 8 per cent a year until 1914, when the war upset things. We got up to nearly normal again in 1920, and then the depression came and it went back about 50 per cent of normal, and the industry lost millions of dollars.

The CHAIRMAN. That does not necessarily mean that you are not getting a reasonable profit, but it means that the farmer has not been making enough money so that he can pay his debts.

Mr. MACDOWELL. The farmer has not been able to pay the fertilizer people and the fertilizer people, if they can not get payment from the farmer, can not pay their debts.

The CHAIRMAN. No.

Mr. MACDOWELL. They can not do that unless they get their money from the farmers.

The CHAIRMAN. No.

Mr. MACDOWELL. So they are up against it. Very few plants were operating in the South this year. They shipped out this spring what they carried over from the year before.

The CHAIRMAN. In the Armour Co., the company with which you are connected, it is mainly the by-product of the slaughtering business, is it not?

Mr. MACDOWELL. It started that way. I developed the idea and took it up with Mr. Armour, and he told me to go to it. I employed chemists and engineers, and began to build it up. At the present time we have plants all over the country and in Cuba, and we make chemical fertilizers, and it is a large business.

The CHAIRMAN. This by-product would otherwise have been lost, if you had not branched out into the fertilizer business?

Mr. MACDOWELL. Oh, yes. That is the way we got into it.

The CHAIRMAN. And that has been profitable, has it not?

Mr. MACDOWELL. Yes; on the whole it has been quite profitable. It is a credit to the beef end of the packing business.

The CHAIRMAN. If the fertilizer company has lost anything, then, in the last two or three years, it has been because of the fact that it is interested in other things than fertilizer?

Mr. MACDOWELL. No; we lost a good deal of money in the decline in value of tankages and blood at inventory, when the slump came.

The CHAIRMAN. Yes; but that did not cost you anything, to begin with?

Mr. MACDOWELL. Yes; we bought it and paid for it.

The CHAIRMAN. As a matter of bookkeeping that happened of course.

Mr. MACDOWELL. And the value of it was credited to the beef and hog end. It was an actual loss.

The CHAIRMAN. Still the fact remains, does it not, that it was a by-product of the Armour packing establishment, and if it had not been made into fertilizer, it would have been a total loss?

Mr. MACDOWELL. Yes; the credit lowered the cost of meat. The fertilizer industry was primarily a conservation industry. It takes waste material from the cities and puts it back on the farm as fertilizer.

Take coke, the saving of 5 pounds of ammonia per ton of coal coked and sending it to the farm. That is conservation.

The CHAIRMAN. Yes; I agree with you on that.

Mr. MACDOWELL. It is very interesting from the chemical point of view.

The CHAIRMAN. As a matter of expense, now, to the fertilizer people, does it cost as much per ton of fertilizer now as it did before the war?

Mr. MACDOWELL. Well, the costs of freight are higher.

The CHAIRMAN. Is there any other difference?

Mr. MACDOWELL. Not much. The labor costs are a little higher, but that is not very important.

The CHAIRMAN. You do not have to employ skilled labor?

Mr. MACDOWELL. Not much. Of course, we have chemists and electricians, and they are skilled, but the rank and file are common, every-day men, the men who do the heavy work. It is a basic industry. As I say, it is overly developed for the time being. In some ways it has not been well developed. It has had its weak points. Its methods of selling are not, perhaps, what they should be. The unlimited credit practiced is expensive. It costs money to keep track of all those things, but the main effect is that too many companies, too many competitors, try to sell the same man. Every time they go to see him it costs money. Whether they get the business or not, that expense is there.

The CHAIRMAN. Is there any indication of a tendency on the part of the fertilizer people to eliminate the freight in the sending to farmers or to local organizations of farmers fertilizer in concentrated form, so that they can mix it?

Mr. MACDOWELL. Oh, they can always, and many do now, buy the ingredients and do their own mixing. There is a certain amount of it done on the farm, where they want the higher grade of materials.

The CHAIRMAN. Most of the freight comes in the cost of shipping what is known as the filler, does it not?

Mr. MACDOWELL. Well, that is a part of it; but that is not so important as you might think. A good deal of expense is involved before you get to the point of shipping anything out, in the bringing in of phosphate rock, and sulphur and nitrate for sulphuric acid. All of those elements are essential to the making of acid phosphate.

The CHAIRMAN. Of course, they are but a very small part of the freight.

Mr. MACDOWELL. Oh, no; they are pretty big parts, because that is over 50 per cent of the total volume of the fertilizer industry. The freight charge bears more heavily upon the incoming materials. All of the ingredients for complete fertilizer are brought in from outside, many of them from long distances. The outgoing freight charge is a smaller proportion of the whole, because one of the developments of the industry which makes for economy is the establishment of numerous plants throughout the country which serve as distributing points for local needs, and the freight rate on outgoing shipments is accordingly reduced.

The CHAIRMAN. How much filler is there in a ton of fertilizer, in addition to the three fertilizer ingredients?

Mr. MACDOWELL. Do you mean as the elements, or combined with other things?

The CHAIRMAN. Either.

Mr. MACDOWELL. About 300 pounds of elementary fertilizer, and the balance is about 1,700 pounds of carrier.

The CHAIRMAN. Yes.

Mr. MACDOWELL. There may not be a pound of filler in that.

The CHAIRMAN. Perhaps I was not correct in using that particular term. I mean something that does not do the plant any good, something that has no nourishment in it for what the farmer is going to raise.

Mr. MACDOWELL. Most of these things have value, aside from the three essential things. They have a certain value. Take bone for instance. There is a great deal of lime and minerals in bone. It may have 500 pounds of nitrogen and phosphoric acid in it and 1,500 pounds of lime.

The CHAIRMAN. But if a farmer were going to use lime on his soil he would not ship it across the country. He would get it locally.

Mr. MACDOWELL. He would get it as near by as he could.

The CHAIRMAN. Yes.

Mr. MACDOWELL. But the cost of purifying bone and taking out the lime would be too much, and it is the same with other materials. Except on long freight hauls it would not pay to do it. Do you see what I mean?

The CHAIRMAN. No; I am afraid I do not see what you mean there.

Mr. MACDOWELL. For instance, take potash. You get it from the mines. It comes out here 20 per cent potash. That is run of mine stuff.

The CHAIRMAN. Yes.

Mr. MACDOWELL. You can buy that at a certain price per unit for manufacture delivered here. To concentrate they will take 3 tons of 20 per cent and concentrate it to 50 per cent.

The CHAIRMAN. Yes.

Mr. MACDOWELL. And you will have to pay more here per unit for the 50 per cent than you do for the 20 per cent, at port. Now, for the port plant, you would use the 20 per cent in goods, because it would be cheaper to ship out anywhere within a proper distance of the port plant; but if you wanted it to go back to Nashville or Atlanta, you would find that it would be a saving in freight to ship the 50 per cent material instead of the 20 per cent. Concentration is one of those processes where you have to figure your freight against it. They have been making concentrated phosphate fertilizers in Holland and Belgium for years, 45 per cent phosphoric acid goods, but the Belgian farmer does not use it. It is only used in New Zealand and Australia and for a time it was used in Japan, where the big saving in freight cost made it more profitable for them.

The CHAIRMAN. When they got it there they mixed it there?

Mr. MACDOWELL. They then reduced it there. That was purely a freight proposition.

The CHAIRMAN. Yes.

Mr. MACDOWELL. Now, the Belgian farmer, and he is a good one—does not buy these concentrated phosphoric acid fertilizers. He takes the 16 or 18 or 20 per cent grade.

The CHAIRMAN. I can easily then see how that would occur. He would think that those people could mix it cheaper than he can. But all of Belgium is just an ordinary

American county, and freight does not cut much of a figure in it; but when you have to make fertilizer in Chicago and ship it to Alabama—

Mr. MACDOWELL. Of course, we would not do that.

The CHAIRMAN. About how far do you ship it?

Mr. MACDOWELL. To the central part of Indiana and northern Ohio and Michigan.

The CHAIRMAN. What about Maine?

Mr. MACDOWELL. We have a plant at Searsport and one at Bucksport, Me.

The CHAIRMAN. What do you ship to Searsport?

Mr. MACDOWELL. We ship from our New York plant our acid phosphates. We may take our sulphate of ammonia and our nitrate of soda and our blood and potash and mix those up, and then barge them up to Searsport or to Bucksport.

The CHAIRMAN. What do you do with it there?

Mr. MACDOWELL. We put them into the plants and let them stand there, and ship out when the orders come in.

The CHAIRMAN. What do you mix it in?

Mr. MACDOWELL. Not anything ordinarily. We ship our concentrated fertilizers up to them.

The CHAIRMAN. Then, the Maine farmer has to pay the freight from New York?

Mr. MACDOWELL. Yes; the Maine farmer has to pay the freight from New York.

The CHAIRMAN. On everything that he puts into the ground?

Mr. MACDOWELL. On everything that he puts into the ground. We mix some goods at Searsport. We may bring potash there, but that is not a good port. It has to go to Boston and be transported, but we have a plant there that will take care of all that the farmers need.

The CHAIRMAN. It seems to me in this country, where it is admitted that 40 per cent of the cost to the farmer is freight, we ought to eliminate freight if we possibly can by shipping in concentrated form.

Mr. MACDOWELL. That is what we try to do.

The CHAIRMAN. And cut out all of this filler.

Mr. MACDOWELL. That is what we do in shipping to the small plant where we make goods. That is our method of assembling. Baltimore is the largest producing center. They can make pretty close to a million tons at that point. There is no earthly reason for a million tons of production at Baltimore. There is about 500,000 tons of normal consumption near there [indicating on chart].

The CHAIRMAN. That means that they ship a good deal of it quite a distance?

Mr. MACDOWELL. Yes.

The CHAIRMAN. Out beyond where there are mixing stations?

Mr. MACDOWELL. Yes. The chart shows a production of 895,000 tons out of Baltimore. Now, there are 212,000 tons at Norfolk, and 132,000 tons out of Chicago. Here is one—

The CHAIRMAN. You did not give the name of the place.

Mr. MACDOWELL. Nashville, Tenn., 168,000.

The CHAIRMAN. Here are some in South Carolina [indicating on chart].

Mr. MACDOWELL. Yes.

The CHAIRMAN. And Georgia.

Mr. MACDOWELL. Yes.

The CHAIRMAN. Right along the coast, and very large ones.

Mr. MACDOWELL. Yes sir; they get their phosphate rock from Florida, right in here [indicating on chart].

The CHAIRMAN. They do ship that amount by water?

Mr. MACDOWELL. They ship that amount by water. They move it up here [indicating on chart] at \$2.

The CHAIRMAN. Up to Baltimore?

Mr. MACDOWELL. Up to Baltimore, from Tampa.

The CHAIRMAN. From Tampa, Fla.?

Mr. MACDOWELL. Yes; \$2. That is the ocean rate—\$2 to \$2.10. That is back to pre-war rate. It costs \$2.975 to ship a ton of phosphate rock by rail from Tampa to Jacksonville.

The CHAIRMAN. From one part of Florida—

Mr. MACDOWELL. To Jacksonville by rail, where we manufacture it.

The CHAIRMAN. Now much does it cost?

Mr. MACDOWELL. I think it is \$2.975.

The CHAIRMAN. For how many miles?

Mr. MACDOWELL. It is not a very long haul, 248 miles.

The CHAIRMAN. That is a fair illustration of what is going on all over the country in the freight business.

Mr. MACDOWELL. Yes. Now, here in Tennessee, right here [indicating on chart], that is where the phosphate comes from. It is more expensive to mine Tennessee

phosphate because it is not in big deposits, but we are using at Atlanta phosphate rock which comes from here [indicating Florida on chart], because it is cheaper than phosphate rock coming from here [indicating Tennessee]. We are moving, as I say, all of this material around here to those different ports. The potash comes in by water from Germany and France. About half of it comes from France, and the sulphate of ammonia and cottonseed meal and other things are shipped right to those plants. A good deal of the South American tankage comes here [indicating on chart].

The CHAIRMAN. Do you get any potash in your fertilizer business that is not imported?

Mr. MACDOWELL. I do not know as I understand your question. Cottonseed meal carries a little potash.

The CHAIRMAN. Suppose the supply from Germany and France were cut off? Where would you go for potash?

Mr. MACDOWELL. We would do what we did during the war. I personally started the first potash mine in the United States, down in south Utah.

The CHAIRMAN. Is there any operation there now?

Mr. MACDOWELL. Oh, no. They are closed down tight, on account of the German and French prices; but it rendered a big service during the war.

The CHAIRMAN. Well, we had it in abundance, too.

Mr. MACDOWELL. Yes. Then, there is Nebraska deposit. That development followed ours along simultaneously; but here is where the potash is used, Senator, right along the coastal plain running from Maine and to the Gulf [indicating on chart]. Here is the biggest potash consuming section, and here is our big potential production—California [indicating on chart]. That is where the big manufacturing is done. You will notice that this is not at all tributary to the Muscle Shoals section. In other words, you will have to go a long ways in order to get over to where the big bulk of the fertilizer is used.

The CHAIRMAN. All of this territory within a reasonable distance of Muscle Shoals is territory that ought to use a great deal of fertilizer.

Mr. MACDOWELL. It ought to, but Alabama has gone back, and uses less than some years ago. But this year, it is showing up a little better.

The CHAIRMAN. It seems to me that this all goes to the proposition that it is too expensive to use it.

Mr. MACDOWELL. No; it is the mental attitude which present conditions have developed in the farmer.

The CHAIRMAN. But that comes back to the question of making both ends meet in farming, does it not?

Mr. MACDOWELL. Yes.

The CHAIRMAN. It costs the farmer more to produce than his goods are worth?

Mr. MACDOWELL. Yes.

Senator HEFLIN. His purchasing power has been lessened.

Mr. MACDOWELL. Yes.

The CHAIRMAN. That is not the only thing, of course. Freight is the biggest item in regard to his fertilizer, and it hits him just as hard as anything else.

Senator HEFLIN. Another thing that accounts for the small consumption in Alabama is this: We usually produce 1,500,000 bales of cotton there. Last year, we produced about 450,000 bales. The farmer will not buy fertilizer, and he can not raise it without the fertilizer.

Mr. MACDOWELL. Yes.

Senator HEFLIN. He does not want to buy the fertilizer to feed the boll weevil.

The CHAIRMAN. That is the idea.

Mr. MACDOWELL. And you can not blame him. Of course, we are studying that whole thing as best we can.

The CHAIRMAN. And he will not raise enough to feed the boll weevil unless he does buy fertilizer.

Senator HEFLIN. Do you mind telling the committee what you think should be done?

Mr. MACDOWELL. The fertilizer educational bureaus do not maintain experimental farms. Their feeling is that this work should be carried on by the Government and State experiment stations. They do, however, maintain agricultural fellowships at several of the State experiment stations, furnishing funds for special investigations, the result of which will be published by the stations when concluded. Some of these fellowships are studying methods of applying fertilizer for the different crops in various types of soils; fertilizer formulas; concentration of plant food and its advantages and dangers. Some manufacturers are, however, making practical demonstrations in the cotton section of how to combat the boll weevil, using the methods worked out by the Government and States. My own company is doing this on a 6,000-acre cotton farm in Georgia, where some 75 negro tenants work the land. The idea is to demon-

strate that the weevil can be controlled and cotton profitably grown by using methods within the financial means of the average small owner or tenant farmer.

The plan carries with it the planting of other crops, that the farm may be more self-supporting. The work is in charge of Dr. DeLoach, former director of the Georgia Agriculture Experiment Station, now in charge of agricultural research for the Armour Co. The Georgia station and the Department of Agriculture are cooperating.

A get-together meeting of the tenants, through a barbecue, was held, and the plan of operation explained. This has been followed by other meetings as the work progressed. Great enthusiasm has been aroused, and so far everything is working out as planned. A simple hand calcium arsenate duster was made from an empty molasses can, riveted to a stick, with a piece of cheesecloth as a sieve fastened on the bottom. This cost about 15 cents. The tenants were shown how to use it on small cotton plants by jarring the stick on the ground and shaking a little of the poison on the plant. This struck the negroes as practical, some 150 were made, and the pickaninnies were put to work when the first boll weevil appeared. A pound of poison to the acre is used on one application by this method.

Senator HEFLIN. And when the boll weevil eats the leaves he becomes poisoned and drops off?

Mr. MACDOWELL. Yes; when the cotton plant gets larger the regular dusting machine will of course be used. Certified seed has been planted, the best soils for the cotton fields were selected, proper fertilizers have been furnished, and so far everything is working out on schedule. The experiment is attracting a great deal of attention and the plantation is being visited daily by planters. Expenses are being kept down. The aim is to get as near a bale of lint cotton to the acre as possible, and thus reduce the cost to grow.

The CHAIRMAN. What do you think the Government ought to do with Muscle Shoals, Mr. MacDowell?

Mr. MACDOWELL. I think the ammonium-nitrate plant at Muscle Shoals should be held in reserve.

The CHAIRMAN. Do you think it should be kept in stand-by condition?

Mr. MACDOWELL. It should be kept in stand-by condition. I think the Government should go ahead and develop the water power sensibly. I do not mean a tremendous amount of secondary power that may not be used except for a few months in the year, but well-balanced power. I think, rather than put in the secondary-power electrical equipment, it would be better to go upstream and put in dams.

The CHAIRMAN. What would you do with the power when you have had it developed?

Mr. MACDOWELL. I am quite sure that if you develop that power and it is sold with no discrimination and to the advantage of that section, it will be taken care of.

The CHAIRMAN. You mean by that that there would be a market for it?

Mr. MACDOWELL. That there would be a market for it.

The CHAIRMAN. At a fair value?

Mr. MACDOWELL. At a fair value; yes, sir; and you will get diversified industries in there, and you can always hold back enough power that you can take at any time for Major Burns to run his nitrogen-fixation plant.

The CHAIRMAN. Oh, yes.

Mr. MACDOWELL. There is no difficulty about it. There are steam plants there now. You can start in two or three weeks to make it.

The CHAIRMAN. Yes.

Mr. MACDOWELL. It is so valuable in an emergency that I think, by all means, it should be conserved and kept in shape, but I do question whether it is good business to run it when there is no need for the product, and there is the expense of coal, labor, and different things of that kind. Furthermore, I think, from the Government's standpoint or from the standpoint of the private individual who may, when the nitrogen is used in a larger way, want to make it, that probably those electrical-power processes will not be in order. The Haber process, as Major Burns will tell you, now requires one-fifth of the power that the cyanamid does, and it does not destroy nearly as much raw material. I mean by that you will not burn up as much coal or as much lime or use as much transportation in making it.

When the Muscle Shoals plant was started it was necessary to have additional production not dependent on Chile. The cyanamid process was installed, as that was the only one we really knew how to run as it was being run in this country. The Haber method was really undeveloped.

The CHAIRMAN. Yes.

Mr. MACDOWELL. I was in full sympathy with the building of the cyanamid type of plant. The plant should be held in reserve, and if there is need for the product, either for fertilizer or otherwise, it can be made use of; but I am not in sympathy

with developing this water power and letting one man control it. I think it should be run for the general good of the region. That is my feeling.

Senator HEFLIN. If you had known, then, when you helped to institute this work that Ford was liable to get it, you would not have had anything to do with it, would you?

Mr. MACDOWELL. Well, I do not think that that, Senator, would have made any difference at all. I was in this war helping all I could, and I was for anything and everything that would be successful in getting us in shape as quickly as possible to do good fighting.

Senator HEFLIN. If Mr. Ford should get it and start to manufacture fertilizer on a large scale, building up other industrial works down there and giving employment to a lot of people, and help to bring the price of fertilizer down to the farmer, don't you think that that would be putting this project to good use?

Mr. MACDOWELL. Well, I am very doubtful, Senator, if Mr. Ford can very materially cheapen the price of fertilizer, from my knowledge of how these things are made. We can talk about secret processes, and we can talk loosely about a good many things, but the basic cost of fertilizer is very well known.

Senator HEFLIN. Yes.

Mr. MACDOWELL. And the possibilities of decreasing the cost are pretty well known. We know to-day that the way to decrease the cost of the fertilizer to the farmer is to put a lot more fertilizer through the plants and cut the cost down. As it is now, there is too much overhead, and not enough going through. When you talk about Mr. Ford's materially cheapening it, I can not see how he can do it, but I can see how Mr. Ford could very seriously disturb the fertilizer industry. As you know, that is the easiest thing in the world to do with any industry, if you have power enough to come in and do it, but I do not see that he is offering anything that we do not already know. I do not see that he is offering to do anything that other elements in the industry can not do, providing they have the facilities, and if there is need for a more concentrated fertilizer we can make it of double strength, and we are making it now for the farmers who want it. Our truck fertilizers are quite concentrated. All this is a part of education. It takes time; it is a slow proposition.

Now, I do not believe Mr. Ford could go ahead and make these concentrated fertilizers and sell them. I do think that our company, or any other company that is qualified to do things, can make concentrated fertilizers at Tampa, Fla., just as cheaply as Mr. Ford can, as far as the making is concerned, but I would be slow about doing it, because I would be very much afraid that we could not sell the product, because to change over to a new method of use involves a certain amount of time and study on the part of the farmer.

Senator HEFLIN. And it is quite natural for the industry with which you are connected to wish to keep out anybody from coming in competition with it?

Mr. MACDOWELL. Oh, yes; but we can not help that part of it. Anybody who wants to can get into the fertilizer business.

Senator HEFLIN. Mr. Mayo, the chief engineer for Mr. Ford, stated to this committee that they can produce fertilizer there for half of the present cost and could sell it to the farmer at half the present price, but you do not think that is possible?

Mr. MACDOWELL. I do not think it is anywhere near possible; no.

Senator HEFLIN. He might do it, though; he brought down the price of automobiles.

Mr. MACDOWELL. Yes; of course, he has done that.

Senator HEFLIN. And nobody could do that before him?

Mr. MACDOWELL. But he has an assembling and repetition process there which does not apply so well to the fertilizer industry. His problem is much simpler. He sells a \$350 article—we a \$25. He makes one model; we make many brands. He ships steadily; we ship our year's make in four months. He sells for cash—we on credit. Our problem is proper selling representation. It has been reported to me that 20 salesmen would call on one merchant in one town in a territory in one week, representing 20 different fertilizer companies, selling fertilizer. Don't you think that duplication of work enters into the cost of selling the fertilizer?

Senator HEFLIN. Oh, yes.

Mr. MACDOWELL. That is the trouble; there is so much competition; everybody is after the business, and they all go to great lengths to get it. The minute the demand increases and this pressure is lifted a little it won't be so expensive, but when we have 50 per cent demand and 100 per cent capacity pushing up expenses everybody scratches gravel trying to get what little business there is. It is impossible, of course, to work well under those circumstances.

Senator HEFLIN. We are anxious to build up the country industrially and agriculturally and to help the cause of labor, and Mr. Ford seems to be about the only one who offers any hope along that line.

Mr. MACDOWELL. I do not know how much you could count on a large labor employment there through these chemical processes. As a rule, they do not use much labor.

Senator HEFLIN. Well, he would probably make other things there. He might build a cotton mill there.

Mr. MACDOWELL. Oh, yes; or he might make motor parts, too.

Senator HEFLIN. Yes; he might make motor parts there or various other things.

Mr. MACDOWELL. Yes.

Senator HEFLIN. He might build an industrial city there, and he might give employment to thousands of people there. If a man like that could get this project, it seems to me that it would serve the needs of more people than any other use that we could put it to.

Mr. MACDOWELL. Well, of course, that is rather problematical. It is hard to tell. The fertilizer industry wants to see that section developed, and it naturally wants to get industry started down there. It helps the farmer to have a near-by market and it is always desirable to have a diversity of interests. It seems to me it would be better to try to have many diversified interests in there. I think you would be stronger and safer during hard times and would have steadier labor employment, and you would have a bigger pay roll than you would have by giving the power to one man and letting him develop it largely along metallurgical lines, because that is probably what would happen.

Senator HEFLIN. Suppose Mr. Ford gets it and uses part of the power for making fertilizer and part of it for making automobile parts, and partly for spinning cotton. In that event he would give a great many people employment all the time, would he not?

Mr. MACDOWELL. Yes; all of those industrial developments are worthy of every study and consideration, of course, but I can not help but feel that it is better for that section of the country to have the power developed and thrown into general service, rather than to have it developed by one set of men, giving them the right to say what kind of an industry shall be developed down there.

The CHAIRMAN. But you must remember, Mr. MacDowell, it only runs for a hundred years.

Mr. MACDOWELL. Yes, I also pay tribute to the modesty of that provision, but seriously, who knows what the situation will be in even 50 years. What will the power be worth then? Will the coal be largely exhausted? One hundred years is a long time.

The CHAIRMAN. Is there anything else, Senator Hefflin?

Senator HEFLIN. I believe not, Mr. Chairman.

The CHAIRMAN. Do you think of anything else that you want to say, Mr. MacDowell?

Mr. MACDOWELL. No; I think I have said a whole lot. I did not intend to fill up the record with this conversational material.

The CHAIRMAN. We have no further witness for to-day.

Mr. MACDOWELL. Can you suggest anything, Major Burns, that I have overlooked?

Major BURNS. I would like to know what you think is the best possible scheme for cheapening the price of fertilizer.

The CHAIRMAN. Yes; we would like to have you tell us that, if you can.

Mr. MACDOWELL. I can not suggest anything concrete. The first thing to get fertilizer costs down is more business.

The CHAIRMAN. Of course, in that respect, it is like a good many other things?

Mr. MACDOWELL. Yes; the use of higher grades will reduce plant food costs on the farm too. Right now, the fertilizer industry is in real bad shape. It has lost \$75,000,000 this last year.

The CHAIRMAN. And to a great extent that loss comes about due to the fact that the farmer has not been able to pay for it?

Mr. MACDOWELL. First the farmer did not feel able to buy much of the product, and then he was unable to pay for what he did take at the low price. Also he was unable to pay for what he had the year before. A lot of it had been used under cotton when the cotton was up around 30 cents.

The CHAIRMAN. That has been unquestionably true of farming all over.

Mr. MACDOWELL. Yes.

The CHAIRMAN. They have not received enough for their products to pay for the cost of producing them.

Mr. MACDOWELL. Yes; that is right, and they fertilizer people are in the same shape.

The CHAIRMAN. On the other hand, because the farmer could not get cheaper fertilizer is one of the elements that caused him to quit.

Mr. MACDOWELL. Of course, in the fertilizer industry we feel that way, and we have felt that way.

The CHAIRMAN. You still say there is so much nitrogen here we have more than we need?

Mr. MACDOWELL. We are not using it. Our farmers do not buy it. They are using a little more nitrogen this year than they did last year, because they are feeling a little better, and they saw that their small use last year was not profitable for them, and they are using a little more, calling for more units of nitrogen in a ton than last year.

The CHAIRMAN. As a matter of fact, if the farmers used the fertilizer they ought to, there would be a shortage of nitrogen, would there not?

Mr. MACDOWELL. Yes, sir.

The CHAIRMAN. According to your figures?

Mr. MACDOWELL. We would have to go to Chile and get more of that particular form; we can import from Europe. Then we could start manufacture in this country, and we would naturally have increased recovery from coking plants as they increase in numbers, plants making coke for metallurgical purposes or for domestic purposes—smokeless coal.

The CHAIRMAN. Ought we not to encourage from any source increased production of fertilizer ingredients?

Mr. MACDOWELL. Yes.

The CHAIRMAN. And get as much as we can of them, at least up to a good deal more than double the present output of fertilizer?

Mr. MACDOWELL. We should do it just as fast as we can, but we can not do it too rapidly. I mean there is no sense in doing it long before the fact, because as we stand to-day here in the first three months of this year we exported 58,641 tons of sulphate of ammonia.

The CHAIRMAN. How much did we import?

Mr. MACDOWELL. One thousand six hundred and forty-eight tons. That is, sulphate of ammonia. We don't want to confuse that with nitrate of soda.

The CHAIRMAN. How much did we import of nitrate of soda?

Mr. MACDOWELL. Fifty-two thousand and eighty-two tons in the first quarter of 1922.

The CHAIRMAN. We are all agreed, are we not, that the farmers in America do not use enough fertilizer; that they ought to use more than twice what they use now?

Mr. MACDOWELL. Well, they could use more, but they have got to sell—

The CHAIRMAN. If they used twice as much as they do now they would still be under Germany?

Mr. MACDOWELL. Oh, yes. But of course there is the practical question of the disposal of what we grow. If we increase our wheat production, for instance, our exportable surplus, from say 250,000,000 to 600,000,000, which we can easily do, could we sell it?

The CHAIRMAN. You might say, even, that we ought not to use as much as we do, in order that we might not produce as much?

Mr. MACDOWELL. No; or we might say also that we should use only half the ground that we do, because we could grow what we need on half our acreage.

The CHAIRMAN. Yes.

Mr. MACDOWELL. But many people are farming, and they want to continue to farm, and it is proper that they should. So there are questions that come in that are pretty hard to answer.

The CHAIRMAN. If we do not use fertilizer it will soon be that we won't purchase anything in many sections.

Mr. MACDOWELL. Oh, yes.

The CHAIRMAN. I presume that in time that is true in every section of the country?

Mr. MACDOWELL. Oh, yes; there is no question about that, and it is a basic, big problem; but so far as the fertilizer industry is concerned it can serve much better and serve at a lower price if the farmer will use fertilizer up to 80 per cent or 90 per cent of the producing capacity of the plants that exist to-day.

The CHAIRMAN. Yes; I can see that very clearly, but still you can not get away from the fact that there ought to be more fertilizer used, and the farmer himself knows it.

Mr. MACDOWELL. Yes.

The CHAIRMAN. He would like to have more, but can't buy it.

Mr. MACDOWELL. He can buy it, Mr. Chairman.

The CHAIRMAN. He has to pay the price for it.

Mr. MACDOWELL. He can't get something for nothing.

The CHAIRMAN. Of course he can't get something for nothing.

Mr. MACDOWELL. He does not know what fertilizers cost. He may have a wrong impression on that.

The CHAIRMAN. He knows what they cost him. He can figure out himself that in buying fertilizer, even after he gets it, so far as the fertilizer is concerned, he still has a whole lot of risk to run, whether he is going to get anything or not.

Mr. MACDOWELL. Yes.

The CHAIRMAN. And that must be taken into consideration.

Mr. MACDOWELL. Yes.

The CHAIRMAN. When it comes to a point that he reaches that his fertilizer, among other things, costs too much, he does not buy it, of course.

Mr. MACDOWELL. Of course he is not really in position to judge whether the price he pays for his fertilizer is a fair price.

The CHAIRMAN. He is in the best position in the world to judge whether it is a fair price for him. He knows what he is going to produce under ordinary conditions better than you do.

Mr. MACDOWELL. Yes; if he really does.

The CHAIRMAN. Some of them keep books. But if he does not keep books, as some of them do, he knows in a general way.

Mr. MACDOWELL. But they don't generally keep track.

The CHAIRMAN. You might just as well say that he has no way of knowing what he should pay for a cow.

Mr. MACDOWELL. When you consider that the fertilizer industry goes to Chile for nitrate of soda for use in making sulphuric acid; goes to Louisiana and Texas for sulphur, transporting it up to the interior of the country; mines and washes the phosphate rock and dries it and ships it to the plant; buys bags from India, goes away off there to get them; makes acid phosphate and cures it in the plant; goes out and sells it and delivers it to the farmers at a price equal to 45 cents a bushel for wheat, and a big part of that is freight, I think you will realize that they are operating on as narrow a margin as any industry in the world.

The CHAIRMAN. Mr. MacDowell, it seems to me you jump at the defensive before you are attacked. The question I am asking you have nothing at all to do with whether you are making too much money, or whether you represent a trust. I am not asking that.

Mr. MACDOWELL. No. I realize that.

The CHAIRMAN. I realize that you might possibly be operating at a loss and still be selling your product at a price that the farmer could not afford to pay. If that time comes, or when it does approach, it is to your interest as well as to the interest of the farmer to get some method by which fertilizer can be cheapened.

Mr. MACDOWELL. Of course we are working on that all the time, but we have to have the material, and one thing that makes fertilizer cost more than we are getting to-day is the transportation.

The CHAIRMAN. How much has the freight business to do with the cost of fertilizer?

Mr. MACDOWELL. It averages about 35 per cent of the delivered cost.

The CHAIRMAN. That is a little over one-third.

Mr. MACDOWELL. Yes.

The CHAIRMAN. Then when the farmer pays \$3 for fertilizer he is giving a little more than a dollar to the railroads?

Mr. MACDOWELL. Yes. Our freights have gone up an average of about 120 per cent since 1914. Our freight used to be about 15 to 17 per cent of the cost of the fertilizer and the materials about 65 per cent. Of course every thing during these last few years has been all out of balance. You could not tell what anything was going to cost, and everything has been changed. But right now freights are more than 35 per cent of the cost.

The CHAIRMAN. Are they as much as 40 per cent?

Mr. MACDOWELL. I would say 35. Of course the complete fertilizer is more than the acid phosphate alone, because there are some ocean freights and various other factors that enter into the equation, but it is around 35 to 40 per cent. I would say probably that with the very low price of fertilizer it is fully 40 per cent right now.

The CHAIRMAN. Do you know how much nitrate we imported from Chile during the last year.

Mr. MACDOWELL. A little more than 369,000 tons. In 1918, during the war, we imported about 1,800,000 tons.

The CHAIRMAN. We used that for war purposes, mostly?

Mr. MACDOWELL. Yes, most of it went for war purposes, and we took some away from the fertilizers; took it away from the farmers.

In 1919 part of that Government supply was sold and, as I recall, about a million tons was taken. Is not that your memory, Major? Something like that?

Doctor TOLMAN. The fixed nitrogen research laboratory.

The CHAIRMAN. Yes. That is a Government institution?

Doctor TOLMAN. It is a Government laboratory which was originally in the Nitrate Division of the Ordnance Department. It was transferred on the 1st of last July to the Department of Agriculture. It was established by Mr. Arthur Graham Glasgow, fixed nitrogen administrator, to assist in solving the problems of the Government necessary for the reconstruction of United States nitrate plant No. 1, and those necessary to adapt United States nitrate plant No. 2 for commercial operation in peace time, and to study methods for the fixation of nitrogen in general.

The CHAIRMAN. Go ahead with your own outline.

Doctor TOLMAN. I should like to describe these charts, which illustrate the different methods of nitrogen fixation.

This chart represents the arc method of fixing nitrogen, which is the oldest method of nitrogen fixation.

The CHAIRMAN. In all of these processes when you say "fixation of nitrogen" you mean fixation from the air?

Doctor TOLMAN. Taking nitrogen from the air and putting it into chemical combination. When it is once in chemical combination it can then be transformed from one form to another.

In the arc processes the only raw materials are water and power. The air is heated in the electric arc, where nitric oxide is formed, and on cooling this is further oxidized to nitrogen dioxide. This is absorbed in water to give dilute nitric acid. Calcium nitrate or concentrated nitric acid can then be prepared, and ammonium nitrate can be manufactured provided ammonia from some other source is available. Sodium nitrite is also available as a by-product.

This method of nitrogen fixation uses the most power of any method of nitrogen fixation commercially used. It takes 67,000 kilowatt hours per short ton of nitrogen fixed. It fixes the nitrogen directly in the nitrate form, and makes, as its main fertilizer product, calcium nitrate, which is a material that will not fit into American methods of using fertilizer.

The CHAIRMAN. Could you change it so it would?

Doctor TOLMAN. We have made experiments on graining and oil-coating this material, to decrease its tendency to take up water and to put it in form in which it could be used as fertilizer under American conditions. It is a highly deliquescent material. Our success along these lines has not been very marked, and I think it would be very difficult to prepare it in form so that it could be extensively used.

I should say that the usefulness of this process is limited to the following conditions: Very cheap water power and necessity of having your nitrogen in the nitrate form. In other words, in places in this country where you have very cheap water power and want to use nitric acid for the manufacture of explosives, this would be a method which would be well worth considering; but as a method for making fertilizer for use in this country, it cannot be recommended.

Senator LADD. Is this method commercially employed at the present time?

Doctor TOLMAN. In this country there is one plant operating by this method out in Seattle, and another plant belonging to the same company across the border in Canada. The plant in Seattle has a capacity of about 300 tons of fixed nitrogen per annum.

The CHAIRMAN: How cheap would you have to have your power in order to produce nitrogen that would produce a fertilizer that could be sold on the market at less than the present price of fertilizer?

Doctor TOLMAN. By this method?

The CHAIRMAN. Yes; by the method you have described.

Doctor TOLMAN. I should say that this method was not adapted for making fertilizer for use in American agriculture. The main fertilizer product made by this method is calcium nitrate, which will fit into the intensive methods of agriculture used in Europe, but will not fit into our agricultural methods. It takes up too much water.

Senator LADD. Does it take up more water than ammonium nitrate?

Doctor TOLMAN. Yes, sir. We have made some experiments in graining and oiling this material and in graining and oiling ammonium nitrate, and we have been more successful in graining and oiling ammonium nitrate. Not only is the graining of the ammonium nitrate an easier process but after coating and oiling the ammonium nitrate is more satisfactory.

Senator LADD. Is this method commercially employed in Europe?

Doctor TOLMAN. Yes; this method is used in Scandinavia on a large scale and apparently with success.

The CHAIRMAN. Do they make fertilizer out of it?

Doctor TOLMAN. Yes, sir. They make calcium nitrate, which will go into European agriculture, where they apply fertilizer more by hand and less by machine.

Senator HEFLIN. The cheaper power over there enables them to use it, whereas they could not use it here because the power costs too much?

Doctor TOLMAN. It is not entirely a matter of power, but is determined by the fact that the final material fits into their method of agriculture, but does not fit into our method of agriculture.

I believe if you want nitric acid for making explosives, and are going to use it at the point of manufacture and don't have to transport it, you should give serious consideration to this process; but as to helping the farmer, I think it has nothing in it.

This method of nitrogen fixation shown by this second chart, the cyanamide process, was the next process to be developed.

The CHAIRMAN. That is the process fixed at plant No. 2?

Doctor TOLMAN. Yes, sir. In this process the raw materials are limestone, coke, and air. The limestone is burned, mixed with the coke, and put into an electric furnace, where ordinary calcium carbide, such as is used for making acetylene, is produced. This calcium carbide is then put into an oven and nitrogen obtained from liquefaction of air, is passed through the oven, fixing the nitrogen in the form of calcium cyanamide. After you have got your nitrogen fixed in the form of calcium cyanamide, you can then transform it into any other form that you desire. You can autoclave it with steam and make ammonia gas, and then this ammonia gas will lead to a variety of products, such as anhydrous ammonia, ammonium sulphate, and ammonium phosphate. By oxidizing part of your ammonia with air in the presence of a platinum gauze, you can make nitric acid, and then absorb a further portion of your ammonia in the nitric acid and obtain ammonium nitrate. By combining your ammonia with carbon dioxide and further treatment you can produce urea.

Instead of autoclaving your calcium cyanamide with steam, you can also make a variety of products directly from the cyanamide itself. You can make cyanamide fertilizer merely by taking the calcium cyanamide and hydrating it and coating it with oil. This is the material made and sold by the American Cyanamid Co.

You can make free cyanamide, which has the chemical formula $H_2C(N)_2$, and this material becomes the base material for a variety of chemicals.

You can also make urea by a different process from that described before, without going through the stage of ammonia gas but by treating cyanamide directly with acid.

By treating the cyanamide with alkali you can make dicyanodiamide, which is an important base material for the manufacture of dyes, explosives, and chemicals.

By fusing the cyanamide with sodium chloride a crude cyanide can be made, suitable for the leaching of gold and silver ores, and this in turn can be treated with acid to give hydrocyanic acid, which is used in the fumigation of citrus fruit trees.

I should like to point out one particular thing with regard to the cyanamide method of nitrogen fixation. These materials shown on this line [indicating chart] can be obtained from the cyanamide method of nitrogen fixation and can not be obtained from other methods of fixation. In the cyanamide method of nitrogen fixation the nitrogen atom is combined directly with the carbon atom, and thus gives the possibility of a variety of organic chemicals which can not be obtained from the arc process or the Haber process.

For instance, from this material free cyanamide, you can make guanidine and nitroguanidine, and we have developed methods for making free cyanamide in a cheap way. It has hitherto only been made on a laboratory scale.

We have also developed the method for making guanidine and nitroguanidine. If in the future smokeless powder should contain one-third nitroguanidine, the total capacity of the Muscle Shoals plant would be nowhere near enough to keep an army of 50 divisions in the field, and at the present time the only other source of nitroguanidine on this continent would be the American Cyanamid Co. in Canada.

This method of nitrogen fixation takes less power than the arc process, namely, 15,000 kilowatt hours per ton of nitrogen fixed. It leads to all the

nitrogen products that any method of nitrogen fixation can produce, and it will lead to some that the other methods of nitrogen fixation can not produce.

Later on I will give comparative figures between these various processes.

The CHAIRMAN. If you intend to give it later on, but in the meantime we would like to have you explain what the possibilities are of the utilization of this cyanamid process for making fertilizer.

Doctor TOLMAN. Later on I have a chart that will show that better.

The CHAIRMAN. All right. I don't want to interfere with your outline, but don't forget that.

Doctor TOLMAN. This chart shows the so-called Haber process of nitrogen fixation, which is the latest method to be developed.

The CHAIRMAN. That is the process of plant No. 1?

Doctor TOLMAN. Yes, sir; the process at plant No. 1.

This particular modification of the Haber process is called the Haber-Bosch process, Bosch having been the man who introduced this particular method for making the mixture of nitrogen and hydrogen going to form ammonia, and this is the modification of the process which was planned at Sheffield at nitrate plant No. 1.

In this process the raw materials are coke and air and steam. The air and steam are blown through a gas producer containing coke, giving a mixture of nitrogen, hydrogen, and carbon monoxide, containing such impurities as carbon dioxide, sulphur compounds, and other impurities from the coke.

The next step in the process is to take this mixture of gases which contained about equal parts of hydrogen and carbon monoxide and pass it through a catalyst with excess steam, where the carbon monoxide reacts with the steam to give you an equal volume of hydrogen together with carbon dioxide. In this way you double the amount of hydrogen.

The water is then condensed out, the mixture is compressed, and the carbon dioxide removed by water scrubbing, followed in some cases by caustic scrubbing, and finally followed by scrubbing with cuprous ammonia solution to remove the carbon monoxide. After this treatment we then have a mixture of three parts hydrogen and one part nitrogen, which has to be very pure. It is then passed into the circulating system, where it circulates through a catalyst, and the ammonia is formed from the nitrogen and hydrogen.

The CHAIRMAN. You have not any power in that as one of your raw materials.

Doctor TOLMAN. The amount of power used in this particular modification of the Haber process is relatively small—about 4,500 kilowatt-hours per ton of nitrogen fixed. That power goes into running blowers, compressors, and things of that kind.

The CHAIRMAN. What is the quantity of steam you have to have?

Doctor TOLMAN. You have to have large quantities of steam. I can not tell you offhand. Four volumes of steam to one volume of gas. I would have to look it up and tell you actually the pounds of steam you use per pound of ammonia.

In this modification of the Haber-Bosch process the main cost of the process occurs before you start to get you ammonia from nitrogen and hydrogen. From figures that were made for the Sheffield plant it was estimated that 20 per cent of the cost of the process went into making the water gas; 50 per cent of the cost of the process then went into changing the carbon monoxide in that water gas to hydrogen and purifying the mixture to make it ready to enter into the final stage of the process. So that 70 per cent of the total cost of the process occurred before you began to circulate your gas through the system. These figures may be a little bit higher in that particular plant than they may be for other plants, but that gives you an idea of the relative distribution of costs.

Senator HEFLIN. Has you been to Muscle Shoals?

Doctor TOLMAN. Yes, sir. I have been only a few times to Muscle Shoals.

Senator HEFLIN. You have seen the Haber plant there?

Doctor TOLMAN. Yes, sir.

Senator HEFLIN. Do you think it could be made to operate successfully?

Doctor TOLMAN. Yes, sir; by spending enough money.

Senator HEFLIN. How much money do you think it would be necessary to spend?

Doctor TOLMAN. That would depend on the size of the plant, on how much ammonia you wanted to make. If you wanted to change that plant there so as to manufacture about 4 tons of ammonia per day, I think it would cost you nothing under a million dollars to do it.

Senator McKINLEY. What does 4 tons of ammonia a day mean in terms of nitrate of ammonia?

Senator LADD. Four tons of ammonia include what amount of ammonium nitrate?

Doctor TOLMAN. One ton of ammonia will make 2.35 tons of ammonium nitrate.

Senator McKINLEY. That plant there now is supposed to make 20,000 tons a year.

Major BURNS. It is supposed to make 30 tons of ammonia per day, and this 4 tons would be approximately one-seventh of the capacity, and 4 tons would be the smallest amount that you could make on a commercial basis. It is nothing more than an experimental quantity.

Senator McKINLEY. It would cost a million dollars?

Doctor TOLMAN. It would cost somewhere around a million dollars to put that plant in shape to make 4 tons—not the original 30 tons it was designed for.

The CHAIRMAN. What would it cost to have it operated at its capacity?

Doctor TOLMAN. Do you mean what would it cost to put that plant in shape to make 30 tons of ammonia?

The CHAIRMAN. Yes; per day.

Doctor TOLMAN. We would have to do quite a lot of figuring before we could answer.

Senator LADD. What is the chief difficulty with that plant?

Doctor TOLMAN. You mean in its present state?

Senator LADD. Yes.

Doctor TOLMAN. I would say that the plant is now successfully developed through the stage of making the water gas, and changing the carbon monoxide in the water gas over to hydrogen. I would say that the purification of the mixture of nitrogen and hydrogen, preparatory to entering the circulating system, could be modified to advantage. When we come down to the circulating system, I would say that the heat interchangers which lead to the catalyst bomb would have to be entirely reconstructed, and the catalyst bomb would have to be a new catalyst bomb. The method of heating that catalyst bomb would also have to be entirely changed, and the method of refrigerating the gases would have to be changed. In making those changes a very considerable amount of the material already there could be utilized, especially if you were making changes to put in only one unit to make in the neighborhood of 4 tons of ammonia.

Senator LADD. The catalyst used at the present time there is not a satisfactory catalyst?

Doctor TOLMAN. These things that I was speaking of have to do with the engineering construction of the plant. Besides the poor engineering, the failure of the plant was due to the fact that they did not have a catalyst that was any good. It was a catalyst which was poisoned permanently by water and did not recover. Their catalyst, when it was fresh, would make somewhere near 7 to 8 per cent of ammonia. I think that we have developed a catalyst at the Fixed Nitrogen Research Laboratory which, under the same conditions, will make over 16 per cent.

Senator LADD. That is not interfered with by the impurities?

Doctor TOLMAN. The 16 per cent ammonia from this catalyst is for the conditions under which the General Chemical Co. catalyst would give 7 to 8 per cent ammonia.

On impure gas their catalyst was permanently destroyed. On gas of the purity that we could reasonably expect to obtain under commercial conditions we would expect our catalyst to do as good as 12 per cent, and do that continuously over a long period of time, making the recharging of the bombs a small matter.

This chart shows another modification of the Haber process. In this process the hydrogen instead of being manufactured from water gas is manufactured electrolytically, giving oxygen as a by-product. From this stage on the process is just the same as when the Haber-Bosch process is used. As you can see, the preparation of the mixture of nitrogen and hydrogen by this process is far simpler than by the other process, and also you get a much purer nitrogen and hydrogen, and do not have any of the difficulties of removing the carbon monoxide, which is a matter of great expense in the Haber-Bosch process.

This modification of the process will, however, take power. It takes much more power than the other modification, namely, 18,000 kilowatt hours per ton

of nitrogen fixed, as against 4,500 kilowatt hours by the Haber-Bosch process.

With power at about 5 mills per kilowatt hour, the cost of manufacturing ammonia by the Haber electrolytic process and Haber-Bosch process is about the same. With cheaper power than 5 mills per kilowatt hours the electrolytic process is cheaper.

The CHAIRMAN. What modification of the plant down there would be necessary to manufacture it according to this process?

Doctor TOLMAN. In order to manufacture according to this process, you would have to put in electrolytic cells for the manufacture of hydrogen. These electrolytic cells, in order to operate economically, would have to be much larger than any now on the market. The nitrate division and the laboratory have had constructed a 10,000-ampere cell and have experimented with it from the point of view of making hydrogen on a large scale, and have found that it is entirely feasible to build a cell of that size.

The CHAIRMAN. Can you give us an idea of the expense of remodeling that plant No. 1 to make it according to this process? We have power there at Muscle Shoals that would be cheap enough to make this practical, have we not?

Doctor TOLMAN. Yes, sir; the figures for the cost of such a reconstruction have been worked out by the nitrate division, and it can give them better than I can. They were worked out on the basis of putting in an experimental unit that would make about 4 tons of ammonia. My memory of the figure was that to remodel this plant and carry out a test on it for making about 4 tons of ammonia, by the Haber electrolytic process, would cost about \$1,200,000.

Major BURNS. But that would include operation of the plant for several months in order to make sure the process as developed is working satisfactorily. In other words, we figure if we get the plant constructed, we would have some troubles, and we would have to work them out by operating for a period of about three months.

Senator MCKINLEY. What do you think it would cost to make that a 30-ton plant?

Major BURNS. If you put in the Haber electrolytic process at No. 1, you would have to scrap almost everything you have at No. 1. Nothing there would be of any great value. I imagine putting in a 30-ton unit would cost in the neighborhood of \$4,000,000 or \$5,000,000.

The CHAIRMAN. You could use your steam plant there, could you not?

Major BURNS. That would not be of much value to you, Senator, because that would be expensive power.

The CHAIRMAN. You don't use any steam, then, outside of power?

Doctor TOLMAN. In this Haber electrolytic process you use about 2 tons of steam per ton of nitrogen fixed in order to purify the water that goes into your electrolytic cell.

Senator LADD. That is a process you have developed in this country, or is this some plant abroad?

Doctor TOLMAN. This particular modification of the Haber process, obtaining the hydrogen by electrolysis, has been in the minds of a great many people. The only place, I think, where it is in commercial operation at the present time is a rather small plant in Italy.

Major BURNS. That is the Casale process that was mentioned several times by one of the witnesses?

The CHAIRMAN. Before you get through tell us about that process.

Doctor TOLMAN. All these processes are modifications of the Haber process. The General Chemical Co. process, the Claude process, the Bosch process, they are all Haber processes with some modification. We don't know precisely what Casale is doing, but from our best information, this is about what Casale is doing. He is getting his nitrogen by putting air and hydrogen together through a burner, and is operating, we think, at pressures of about from 300 to 400 atmospheres.

The CHAIRMAN. What about the patent rights on these various things? What are you people developing here that the Government owns and that somebody else does not have a patent on?

Doctor TOLMAN. With regard to the patent rights for the Haber process, and particularly the Haber-Bosch modification, those patent rights are all held now by the Chemical Foundation, and by taking out, I think, about five licenses, you can do nearly anything you want to, working at pressures between 100 and 300 atmospheres.

The CHAIRMAN. The Government laboratory has made a great many improvements; it has been working on it a number of years. What about these things that we have developed? Are they using them, and have they gotten patents on developments which you people have made?

Doctor TOLMAN. There are no methods of nitrogen fixation now in operation in this country except the Solvey process plant at Syracuse and the small arc plant up in Seattle. Neither of those is using anything we have developed. The Solvey process people did ask for a license giving them exclusive rights to the use of our catalyst. We said that we believed that a catalyst developed in this way should not be used exclusively by any one concern.

The CHAIRMAN. Is that patented?

Doctor TOLMAN. Patent has been applied for.

The CHAIRMAN. By whom?

Doctor TOLMAN. By the inventor of the catalyst in our laboratory.

The CHAIRMAN. He is a Government employee?

Doctor TOLMAN. He is a Government employee. The patent has been applied for in accordance with the regular War Department regulations, in which the Government retains the right to use the patent itself, and the commercial rights inure to the inventor, and although he has those commercial rights, and they are left with him, nevertheless it is felt that to give a single concern the exclusive right to use that patent would be bad practice.

I may say with regard to the Haber electrolytic process, that there are a number of places in this country at the present time where there is waste electrolytic hydrogen, which is a by-product of oxygen manufacture, caustic manufacture, and bleach manufacture. A great part of that hydrogen is now going to waste. It occurs in amounts sufficient to make from a half ton to six or seven tons of ammonia per day.

We believe that one of the next developments in this country along commercial lines should be utilization of that waste hydrogen in small Haber plants, and a good many people are already interested in that possibility, and it is coming along very fast.

The CHAIRMAN. I want to ask you further about the patent situation: As I understand it, this catalyst has been at least improved by Government employees like yourself?

Doctor TOLMAN. Yes, sir.

The CHAIRMAN. Are those improvements patented by anybody?

Doctor TOLMAN. The improvement on this particular catalyst; yes. Patent has been applied for.

The CHAIRMAN. By a Government employee?

Doctor TOLMAN. Yes, sir.

The CHAIRMAN. So it will come under the regular rule that applies to all Government employees?

Doctor TOLMAN. Well, there is no regular rule. Each department has its own rule.

The CHAIRMAN. Yes; that is true; but it would come under the War Department rule?

Doctor TOLMAN. Yes, sir.

The CHAIRMAN. And that means that the Government can use it itself without paying a royalty?

Doctor TOLMAN. Absolutely; yes.

Senator LADD. How would it be, supposing they would turn the plant over to some party to operate? Would that carry the right to its use?

The CHAIRMAN. No; not as I understand it. Probably you know more about that, Doctor, than I do.

Doctor TOLMAN. I am not enough of a lawyer to say; but the Government can certainly use the catalyst.

The CHAIRMAN. Oh, yes.

Doctor TOLMAN. If they made a Government-owned corporation, which they said was part of the Government, then probably they could use it.

The CHAIRMAN. For instance, referring now particularly to Mr. Ford's proposition by which he would get absolute title to this nitrogen plant down there, the Government would turn it over to him; would he be allowed to use a patent secured by a Government employee without paying a royalty?

Doctor TOLMAN. I should say not.

The CHAIRMAN. That was what I was thinking about. I may be wrong about that, but that is the theory on which the War Department permits its employees to get patents, as I understand it; and it is a fair one, I think, that if they are

working for the Government and they secure a patent, the Government can use it. If anybody else uses it, even though they sell their product to the Government, they have to pay royalty to the man who owns the patent.

Senator HEFLIN. Mr. Ford's representative here claims that they have got a secret process by which they can make fertilizers for about half the price they sell for commercially.

Doctor TOLMAN. Yes, sir; I have seen such reports in the newspapers.

Senator HEFLIN. That is possible, I guess?

Doctor TOLMAN. If it is possible, I don't know how to do it.

Senator HEFLIN. You are learning something every day about this work that you did not know last year, is not that true?

The CHAIRMAN. We all hope that you or somebody—we prefer you and your other associates in the Government—will eventually get a process that will make it so cheap we can get fertilizer way down.

Doctor TOLMAN. I think fertilizers can be made considerable cheaper than they are being made now, but I could not say, right away, without having tried it, that you can sell fertilizers for one half the present price. It is doubtful. You can sell them somewhat cheaper.

Senator HEFLIN. Don't you think fertilizers can be manufactured at Muscle Shoals with the cheap power we have there and be sold from that place very much cheaper than they are sold to the farmers to-day?

Doctor TOLMAN. Might I postpone, Senator, the answer to that question until I take up what we think ought to be done with the Muscle Shoals plant?

Senator HEFLIN. Very well.

Doctor TOLMAN. I would not want to say no to your question; but when you say "very much" cheaper, I don't know just how much cheaper you mean by "very much," and I should not like to commit myself.

Senator HEFLIN. If it is any cheaper it would help the farmer some, wouldn't it?

Doctor TOLMAN. Certainly. I would now like to try to make a statement comparing these three methods of nitrogen fixation.

The CHAIRMAN. Before you do that I would like to ask you about the Casale process.

Doctor TOLMAN. Yes.

The CHAIRMAN. It has been claimed here that that was a great thing, and a man called on me this morning about it. Just while you are telling us about these processes, tell us all you know about that.

Doctor TOLMAN. As far as we know, the Casale process is a Haber electrolytic process, in which the hydrogen is made by electrolyzing water, using cheap power—cheap Italian water power.

The CHAIRMAN. Similar to that last process you have described?

Doctor TOLMAN. Yes, sir.

The CHAIRMAN. Is it patented in this country?

Doctor TOLMAN. They have applied, I think, for two patents, one of them, I believe, is on the burner for preparing the nitrogen and hydrogen mixed by burning air. There is not anything in there that they can patent. Anybody can use that. They operate, I believe, at rather high pressures—probably 300 to 400 atmospheres—although we have not precise information on that point. But there is no particular difference between the Casale process and the Haber electrolytic process.

Since we are talking about all these different methods, I, perhaps, ought to say a word about what is called the Claude process. That, again, is a Haber process, and its only difference is that it operates at very high pressure—in the neighborhood of 1,000 atmosphere—and, as far as we know, it has not gone into commercial operation. It has been tried out on a semiworks scale.

The CHAIRMAN. It is safe to say, for a layman, like myself, that the improvements that have been made in any recent date are all along some modification of the Haber process or practically so?

Doctor TOLMAN. The improvements in nitrogen fixation, you mean?

The CHAIRMAN. Yes.

Doctor TOLMAN. Yes. I would say that the Haber process is the newest of all the methods of nitrogen fixation, and that is the one most susceptible of improvement, and I would say that far more research and far more possibilities of change have been found in the Haber process than in any other method of nitrogen fixation. The arc process is standardized, and also the cyanamide process. The biggest change in the cyanamide process lately has been in moving to very large ovens. We understand the ovens at Niagara Falls now are

bigger than the ones at Muscle Shoals. I think about three times as large. To try to compare these three main methods of nitrogen fixation, I would say that the arc process required the following conditions:

Very cheap water power—

The CHAIRMAN. When you say "very cheap," if you can, I wish you would use that expression in relation to the power that we are going to have at Muscle Shoals. Is that cheap enough to utilize it for the arc process?

Doctor TOLMAN. One mill power would be cheap enough to use the arc process if the product—

Senator MCKINLEY. The testimony of Colonel Bardon was that it would cost 2½ mills, not counting any investment which they now have, but on the money that is put in.

The CHAIRMAN. Senator, the doctor has not made any claim, as I understand it, that they will produce power at 1 mill.

Senator MCKINLEY. He is just starting out.

Doctor TOLMAN. May I change my testimony so as to make it correct? With water power at 1 mill per kilowatt hour, the arc process would be a good method of fixing nitrogen, if you wanted your nitrogen fixed in the form of nitric acid for use on the spot or in the form of calcium nitrate. If you do not want it in those forms—

The CHAIRMAN. Then, what?

Doctor TOLMAN. Then it is not a good method of fixing nitrogen.

The CHAIRMAN. With any kind of power?

Doctor TOLMAN. Yes. Now, I would like to say something about the cyanamide process. The cyanamide process is, I think, gradually going to be displaced by the Haber process, except under special conditions. These special conditions would be or might be those present at Muscle Shoals, where you have cheap water power, and you already have a plant constructed and a plant which would presumably be fairly capitalized at nowhere near its original cost of construction, but perhaps at its salvage value.

We have figures for the cost of ammonia manufactured by the cyanamide and the Haber processes. Our figures are taken from the report prepared by the Nitrate Division, and maybe they have already been introduced. If they have, I don't care to repeat them.

The CHAIRMAN. Go ahead.

Doctor TOLMAN. With power at Muscle Shoals at 4 mills and the plant capitalized at 60 per cent of its original cost, ammonia would be 11.9 cents per pound, including royalties, interest, depreciation, and sales.

The CHAIRMAN. How does that compare with present prices for fertilizer use?

Doctor TOLMAN. That is ammonia gas. It is not sold in that form for fertilizer material.

The CHAIRMAN. That is the one used for explosives?

Doctor TOLMAN. With power at 2 mills, the cost would be under the same conditions 10.8 cents per pound.

For the Haber process, with a plant constructed at the present time, under American conditions, with power at 5 mills, the cost would come out 11.6 cents per pound of anhydrous ammonia, whether manufactured by the water-gas process or by the electrolytic process.

With power at lower figures, the electrolytic process gets progressively cheaper until, with power at 3 mills per kilowatt hour, your cost of ammonia by the electrolytic process has gone down to 9.7 cents per pound. That again includes interest and depreciation. I do not think it includes sales.

I think that gives an idea of the relative cost of the two methods; but there are many more possibilities of improvement in the Haber process than in the cyanamide process. At the present time the Haber process, for which you have no plant, would manufacture ammonia at about the same cost as the Muscle Shoals plant will manufacture it by the cyanamide process, but in the future I think the cyanamide process will be displaced by the Haber process. I would like now to make a statement in regard to the Muscle Shoals plant, but I don't want to take up your time.

The CHAIRMAN. Go ahead. We want you to.

Senator HEFLIN. You say that if the Muscle Shoals plant No. 2 and the plant No. 1 could be made to function properly, it would not supply us with the necessary nitrates in time of war?

Doctor TOLMAN. Well, I don't know just what you mean by that word "necessary." Do you mean to supplement the other sources of nitrogen?

Senator HEFLIN. Well, what portion of the supply could we manufacture at Muscle Shoals with the power we have?

Doctor TOLMAN. That is, you mean in war times?

Doctor TOLMAN. I think Major Burns can answer that question better than I can.

Senator HEFLIN. You said something about the American Cyanamid Co. of Canada would have to supplement the supply that we would produce at Muscle Shoals.

Doctor TOLMAN. Nitroguanidine is a form of fixed nitrogen that can only be obtained from the cyanamid method of nitrogen fixation, and I said that if in the future smokeless powder should contain nitroguanidine as an important constituent, then the capacity of the Muscle Shoals plant would not be enough to manufacture nitrates sufficient to keep 50 divisions in the field.

The CHAIRMAN. That is not used in smokeless powder.

Doctor TOLMAN. It is not used now.

The CHAIRMAN. Would it improve smokeless powder if it were used?

Doctor TOLMAN. I know elaborate experiments are being made in the direction of making nitroguanidine. Can you tell the present state of those experiments, Major Burns?

Major BURNS. The Ordnance Department is always looking for a better propellant, and it thinks there is a possibility of getting a better propellant by use of nitroguanidine, but that is wholly in the experimental stage. We want a powder that will not absorb moisture, so that when the artilleryman throws it around in the field it will not be spoiled, and this nitroguanidine would assist in eliminating moisture. That is one of the big reasons why we are experimenting with it. Of course it is wholly in an uncertain state.

Doctor TOLMAN. I want now to make a statement with regard to the peace-time utilization of United States Nitrate Plant No. 2. The present product, which that plant was designed to make, is ammonium nitrate, and ammonium nitrate can not be the main peace-time product, because it is not used in the present fertilizer practice in America. So some modifications would have to be made in the plant in order to adapt it for peace-time use.

The most natural product that one would think of would be ammonium sulphate. In order to manufacture ammonium sulphate at plant No. 2 it would be necessary to set up a sulphuric acid plant, the units of which have already been shipped down there, and make sulphuric acid, and make ammonium sulphate. With ammonium sulphate at its present price of about \$50 a ton it would not be possible to operate the Muscle Shoals plant and pay expenses manufacturing ammonium sulphate as the sole product of the Muscle Shoals plant. That does not mean, however, that therefore the peace-time utilization at the Muscle Shoals plant is impossible. We believe that the Muscle Shoals plant can be remodeled and redesigned to make a variety of nitrogen containing products and be successfully operated commercially, given cheap water power and a low capitalization.

Senator HEFLIN. Yes, sir.

We have prepared here a chart—of course a purely tentative plan—which would show a variety of materials to be manufactured at the Muscle Shoals plant.

Senator McKINLEY. May I ask, are all those materials for the benefit of the farmer?

Doctor TOLMAN. The larger bulk of the material in tons is for the benefit of the farmer.

Senator McKINLEY. Seventy-five per cent?

Doctor TOLMAN. Yes, sir. You see, we have here 40,000 tons of nitrogen a year, and the only industry that can use that large quantity per annum is the agricultural industry, so that you have got to get rid of the bulk of your material for fertilizers. Those products we have put down here [showing what is manufactured]—ammonium sulphate, ammonium phosphate, urea, ammonium nitrate, which is now the present product of the plant; double salts and mixed salts, containing both ammonia and potash and having less deliquescence than ammonium nitrate; some cyanamid fertilizer; and a variety of high-grade special organic chemicals for which the cyanamide process is especially adapted.

Senator KENDRICK. Do you mean to say that those are by-products that will be manufactured in addition to 40,000 tons of nitrates?

Doctor TOLMAN. No, sir. The sum of all these materials would contain 40,000 tons of nitrogen.

The CHAIRMAN. What would it cost to remodel the plant so as to accomplish that result?

Doctor TOLMAN. We have not got to that stage in our calculations as yet. We would not make any statement.

The CHAIRMAN. Does it mean a comparatively large amount of changes?

Doctor TOLMAN. It does not mean expenses anywhere near the original expense of building the plant. I would say that you could go a long ways in the direction of accomplishing these results with ten to fifteen million dollars.

The CHAIRMAN. Would the plant still be in such condition that you could at once utilize its full capacity for the purpose of making explosives in case of war?

Doctor TOLMAN. Yes, sir.

The CHAIRMAN. You would do nothing in remodeling it in that way to interfere with its being used on short notice for the manufacture of explosives?

Doctor TOLMAN. Short notice would be sufficient.

Senator McKINLEY. As I gather, you would have about 30,000 tons that you could use for farm fertilization out of the 40,000?

Doctor TOLMAN. I don't want to put it quite so low as 30,000 tons.

Senator McKINLEY. Thirty-five thousand tons?

Doctor TOLMAN. Perhaps 35,000 tons, although the—

Senator McKINLEY. How many acres will 35,000 tons fertilize?

Doctor TOLMAN. It depends altogether on how heavy an application of fertilizer you make.

Senator McKINLEY. Well, use the law of averages.

Doctor TOLMAN. Reasonable practice for a farmer would be to put, say, 15 to 20 pounds of ammonia to the acre. I will figure that out for you.

Senator McKINLEY. Please figure it out and put it in the record when you revise your testimony.

Doctor TOLMAN. At 20 pounds of ammonia to the acre, which is a reasonably heavy application, 35 000 tons of nitrogen would fertilize 4,250,000 acres.

The CHAIRMAN. The capacity of the plant is 40,000 tons?

Senator McKINLEY. But the witness says he could not use but 35,000 for fertilizer.

The CHAIRMAN. I understand that.

Doctor TOLMAN. Not all that you can use, but all that it would probably be economical to use. The tonnage that would go into these special chemicals would be very small, but from a money value standpoint the amount would be large.

Senator McKINLEY. You have made that clear.

The CHAIRMAN. And that would be sold for other purposes in commerce?

Doctor TOLMAN. Yes, sir. These things can all go into fertilizer—all of these [indicating on chart]. There is just a small amount that could not go into fertilizer.

The CHAIRMAN. What would be the sale value of the product that would not go into fertilizer, just in round figures?

Doctor TOLMAN. I could not give you the figure on that. We want to try to make it as big as possible, because it does not absorb much nitrogen but brings in bigger returns.

In order to carry out these modifications you would have to take over part of your carbide furnaces to manufacture phosphoric acid, or you would have to build additional furnaces to manufacture phosphoric acid, and that would give you a product which is going to be very important in the next few years.

To sum up what we have to say in regard to the peace-time utilization of the Muscle Shoals plant, we believe that if the property is correctly handled, with good advice, with good chemists, with water power cheaply provided, and the capitalization not set too high on the plant that is not there, then the plant can be successfully commercially operated in peace time as a real benefit to the farmers for the manufacture of fertilizer.

We have a number of samples there [indicating bottles on table] of special chemicals and fertilizer materials which can be manufactured, and also samples illustrating the cyanamide process.

The CHAIRMAN. To utilize this plant No. 2 do you think it would take ten to fifteen million dollars to remodel it and put it in condition?

Doctor TOLMAN. I make this statement, not on the basis of careful calculation, but I should think that for ten to fifteen million dollars you could do everything that we have indicated on that chart.

The CHAIRMAN. And then in addition to that—

Doctor TOLMAN. It might not take quite \$10,000,000.

The CHAIRMAN. Would you, then, in addition to that back up plant No. 1?

Doctor TOLMAN. I believe if that property is going to be handled right you have got to contemplate gradually going over to the Haber process and taking the carbide furnaces which are now used in the cyanamide process and putting them on phosphoric acid.

The CHAIRMAN. Just as a war proposition, even if we could not get anything in peace time, we would not dare think of withdrawing or scrapping plant No. 2?

Doctor TOLMAN. No, sir.

The CHAIRMAN. Because it will make explosives?

Doctor TOLMAN. Yes, sir.

The CHAIRMAN. And we might need it. So we will have to keep that until such time, if ever such time comes, that the Haber process or some other process is sufficiently developed to take its place. I take it that the Government if it remodeled this plant according to your suggestion, so as to make a plant that could manufacture fertilizer in time of peace, notwithstanding that the Government never ought to quit in its experimenting and its attempts to improve and develop whatever process shows the best indication of improvement, that means that we would have to keep the other process there also, according to your idea; that is, that the greatest possibilities are in the Haber process.

Doctor TOLMAN. Yes. We believe, however, that it would be very wrong to scrap that cyanamide plant, and we believe that some nitrogen in the cyanamide form should always be made, because there are certain things you can do with cyanamide that you can not do with any other form of nitrogen.

Senator HEFLIN. You think both of them could be operated, then, to advantage?

Doctor TOLMAN. Yes, sir.

The CHAIRMAN. Senator McKinley, have you any other questions?

Senator McKINLEY. I gather from what you say that the amount of farm fertilizer that could be manufactured would be about 4,000,000 to 8,000,000 pounds. Of course, I live in Illinois, where we have good soil and do not need fertilizer, but what is the rest of the country going to do for fertilizer?

The CHAIRMAN. Oh, well, we won't give it to you in Illinois. Illinois can get along without it.

If there are no further questions we will adjourn.

(Whereupon, at 11.30 o'clock a. m., the committee adjourned subject to call of the chairman.)

MUSCLE SHOALS.

SATURDAY, MAY 20, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to call, at 12 o'clock noon, in room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), McNary, Capper, Keyes, Gooding, Ladd, Norbeck, Harrell, McKinley, Kendrick, and Heflin.

STATEMENT OF MR. THOMAS A. EDISON.

The CHAIRMAN. Mr. Edison is here; and, in an informal way, will you tell us, Mr. Edison, something about Muscle Shoals?

MR. EDISON. Well, three or four months ago Mr. Ford asked me to go down in his car and look over Muscle Shoals and tell him about the machinery down there for making cyanamide and ammonia by the Haber process. I went down there and went carefully over the plant and found that you have a very fine plant there for making cyanamide, from which you can make fertilizer, or you could make explosives.

Then I went over the Haber plant, and it was not good, but the same people have since put up a similar plant which is successful.

Of course, the Government would have the right. I am sure, to use the perfected process by paying a royalty; so with the two processes you would have a sure thing. The cyanamide process, of course, is not as cheap as the Haber process; but it does not matter when we get in war—a few cents extra per pound would not matter. You don't want much power for the Haber process; therefore, if you put the Haber process up there, you would have an enormous amount of power to sell for manufacturing purposes. If you use the cyanamide process you want a lot of power; if you use the Haber process you don't need much.

I think we have had our belly full of war, and I don't think there will be any more war for five years anyway. I think it is a safe bet. So we have got some time to think. The proposition looks very good. There is more power, I think, there than what the engineers report that can be made available.

We must consider the future. If we have to go to war, and they shoot up the Panama Canal and station cruisers outside of that one port down there where they ship the Chilean saltpeter, and a couple of submarines in the Straits of Magellan, you are done up. You have got nothing to fight with except bluff. You ought to take out an insurance policy somewhere. But you won't have any trouble for four or five years anyway. But some day look out. You have got to have something. The whole thing is right down there. You can shoot it up. I mean Chile. You see, Germany got its saltpeter over there, too, but when she couldn't get any more she started all her chemists—and they are fine chemists—and they got the new process and became independent of Chile.

I asked Mr. Ford if he would make a full fertilizer or only cyanamid. He said, "Full fertilizer." He also said, "Won't you look around a circle of a hundred miles around Muscle Shoals and see what you can count on to help out on the fertilizer?" So I went to Wilbur A. Nelson, of the Tennessee Geological Survey—a fine fellow—and he got me a lot of samples, and the geological survey men in Alabama and Georgia did the same. I have got my place full of those samples and am working out a process for obtaining cheap potash. I

was quite surprised to find down there at Cartersville, not very far from Muscle Shoals, a slate formation that is many miles wide and many miles long, an angle of about 30, and I guess there is about enough potash there to supply the United States for centuries. Many experimenters have been trying to get potash out of feldspar, of which you have an enormous amount down there in the Smoky Mountains below Asheville, but they have never succeeded in obtaining it cheap enough to meet German prices.

Senator McNARY. What process, if any, are they using to extract the potash in these mountain deposits?

Mr. EDISON. None. They have not been able to do it commercially.

Senator McNARY. I mean, what are your plans?

Mr. EDISON. I can give you generally what it is. Well, I don't think I had better. I might fail. I have never yet eaten any boiled crow—all my stuff has worked—and I don't want to start now. Wait until I get through experimenting.

The CHAIRMAN. Have you experimented enough to satisfy yourself that it is practical?

Mr. EDISON. I can assure you I can get 90 per cent of that potash out, and I believe I can deliver it f. o. b. Savannah now for 65 cents, and the best Fritzie can do is 55 cents. Of course, they will beat me out, but I will beat them before I get through with it. That is 55 cents per unit. He can do that because he is hard up, and I don't know how long he is going to be hard up, but he can do that and I can't. I am, I believe, within 10 cents of that, but I believe I will get it much lower. That is at Cartersville, Ga. I want power from Muscle Shoals or some other place. You see, with cheap power I would be able to accomplish the cheapening of the potash.

I am also working on the phosphate. That, with nitrogen, would make a full fertilizer.

The CHAIRMAN. Tell us generally what your idea is about the possibilities of power development at Muscle Shoals?

Mr. EDISON. That is out of my line. I don't know anything about that. I have not been in the power business for many years.

Senator McNARY. I would like to know, of the three processes—the arc, the Haber, and the cyanamid—if you think improvements can still be made and whether you are working on a still different one. I would like to have you discuss that generally?

Mr. EDISON. Oh, the field is unlimited. The Lord knows in 20 years present processes may be obsolete. They may all be dead and buried. It is continuous—improvements go on forever.

Senator McNARY. The development?

Mr. EDISON. But you have the power. You have that dam, and you have that power, and it doesn't make any difference; you would just earn enough out of the machinery that you could afford to scrap it.

Mr. McNARY. Do you think you have a process which would be an improvement on any one of those three?

Mr. EDISON. No, sir. I have never worked on any. When they first started the war—of course, I am really a chemist more than anything else, although I have been in every line of business. I have been for 50 years in business, and I have never had in 40 years less than four or five thousand men working for me. Of course, I know all the collateral things. I have been through the mill.

The CHAIRMAN. If there is anything further that you can say about this process we will be very much interested in hearing it.

Mr. EDISON. Well, I think those processes will work out so that the full fertilizer, in the course of a few years, will be extremely cheap, and you certainly will get more bales of cotton. What I saw down there in those poor little starved places near those falls is awful. Cotton about that high [indicating]. I got off and looked at it. That land is all right. It wants fertilizer, and it has got to be awfully cheap.

I have been trying something so as to let the farmer make a part of his own fertilizer. I believe that will come, so he will not have to pay any freight. The freight charges are a holy terror—awful. I am sure you can double your bales of cotton per acre, whatever it is. I guess you get about a half bale now, don't you?

Senator HEFLIN. Much less than that.

Mr. EDISON. Well, all you need is fertilizer.

Senator HARRELD. Can you say anything more about your own process to let the farmer make his own fertilizer?

Mr. EDISON. No. I am not far enough along with it. But I will say I believe it is a coming thing that he can make a fertilizer, but a certain part of that fertilizer he must buy.

Senator HEFLIN. Do you think cheap fertilizer can be produced at Muscle Shoals?

Mr. EDISON. There is one I found out. If you take these Tennessee phosphates and grind them fine enough and your land is sour, you have all the phosphoric you want.

Senator HEFLIN. Do you think that cheap fertilizers can be made at Muscle Shoals?

Mr. EDISON. Yes; I think it can be done very cheap.

The CHAIRMAN. If you have anything else to say we will be glad to hear anything else you have to say.

Senator McKINLEY. About anything.

Mr. EDISON. I would like to say something else. Mr. Ford says to me, "Why can't we put this money in Muscle Shoals and issue currency against it? It is good security." It looked all right, as a great many things do, on its face. So I tried to work out whether it would be all right, and I have been at that in addition to these other things. I have been trying to make that thing work. It don't go. Although there is plenty of security behind that money, it won't work. I am very disappointed. Well, I will tell you, you can't make it gibe in with what we have. The only way is to issue bonds and create a sinking fund. That is the only way I can see.

Mr. MEADOWSBORT (assistant to Mr. Edison). You understand what he means—it does not gibe in with the other matter which you discussed night before last.

The CHAIRMAN. The committee is very much obliged to you.

Senator HEFLIN. You don't think you would like to express any opinion about the various offers?

Mr. EDISON. I don't know about them.

Senator CAPPER. There are several offers before the committee for consideration by the committee, including Mr. Ford's offer. The Senator was asking whether you would care to say anything on that subject?

Mr. EDISON. Well, I don't know anything. I can't say anything. I never worked in that line. I was just down in a narrow, technical way. I have not been working along that line.

Senator HEFLIN. You don't know the details of Mr. Ford's offer, and, of course, you don't know the others?

Mr. EDISON. No. I don't attend to his business.

Senator HEFLIN. You know that Mr. Ford wants to get Muscle Shoals?

Mr. EDISON. Yes. He seems to want it. I don't know why. He has got enough work now. I think he would be very foolish. His wife thinks so, too. He has got \$127,000,000, he told me, subject to check. Now, what the devil does he want of any more money? I am sure he don't. He wants to help the farmer.

Senator HEFLIN. Do you think Ford can manufacture cheap fertilizer at Muscle Shoals?

Mr. EDISON. Oh, well, he would put up all kinds of factories for making everything. There is no end to him.

Senator HEFLIN. He would build a great industrial city down there? Do you think it would probably grow into a large industrial section down there?

Mr. EDISON. Yes; I think so. You will have more manufacturing in the South.

I was reading over all this testimony about the farmers. I think the trouble down South is that they don't have diversified farming. Now, I am in business, and long before the war I was doing about \$30,000,000 worth of business, and I had about 5,000 men; but I have been in lots of businesses before, so I am not stuck on one kind of business, so I got by; and when these things came along and it loomed up, of course, the wages went up, and I had to go to work and keep my wages down. Of course, I paid the men their wages, but I put in automatic machinery to neutralize the extra wages I was paying them. So my total wages did not rise. That is, the wages on anything I made did not rise. They kept raising wages more and more, and I had to work night and day and put in automatic stuff to get rid of a lot of them. So my pay roll is no more per man to-day than it was in 1914. Although the men get more money, it is just as cheap to me. Now, one of my businesses is in the soup. It has all gone to pieces, and my competitors—I don't know, but I

think about 50 of them have gone broke or bent, a lot of them in the hands of receivers, and then there is a lot of them that are run around by the back door. They are run by a lot of bankers trying to get their money out of them. If I had had only that one thing I would have been in a bad condition, but I have got two of them that are booming and another one that is pretty good, so I am on velvet. My pay roll is no more than what it was before the war; and their trouble is that they have not got an automatic machine designer, therefore they can not do what I could do. I don't care what the pay roll is, I could neutralize it every time by making up more automatic machinery. About two years ago I made two machines and saved \$186,000 on my pay roll a year.

Senator HARRELD. I was wondering whether you could teach Uncle Sam to do some neutralizing?

Mr. EDISON. I was thinking that the Government should organize a school for teaching automatic machine designing.

The CHAIRMAN. That is very good.

Mr. EDISON. The trouble is that you may have 500 draftsmen and you will not find more than one fellow in the bunch that has got imagination. Make that fellow a machine designer and before he dies he will create at least \$50,000,000. But they are awful scarce. I get men all the time. I got out a questionnaire and set for college students and was awfully disappointed at the results. I guess we had 2,000, and I think I hired about 70 of them, and only one man has got any imagination. The others didn't have any. I had one applicant day before yesterday who had never heard that McKinley, Lincoln, or Garfield were assassinated. He didn't know they were assassinated, and he had been four years in college. Well, you know I sift them out, and they are doing reasonably well.

I have been working along the line of solving the problem of cheap distribution in merchandising of goods in the city. Perhaps you know that the expense of getting from the manufacturer or the farmer to the consumer is awful, so this will help. The cost of delivery is what I am working on. It is done by electric automobiles in place of gas, because the electric automobile will last, on an average, about 15 years, and the gas car, in that kind of work, does not last more than four years, and then the repairs and everything are excessive. That causes the cost of each delivery to run way up. But the electric is very low, and it only has one moving part, whereas the gas car has 250, and they reciprocate and pound themselves to pieces, and then you have to have experts.

The Ward Baking Co. started the ball rolling by the milk and bread delivery, and so they went in and made their own automobiles, and then so many milk people and other people have these deliveries where the life of the trade is the small cost of delivery. Now, they are spreading all over and my factory is booming, and I have the only thing they can use. That is going to help all over.

The CHAIRMAN. What, in your judgment, are the possibilities of the development of the storage battery so that it can be used in all kinds of transportation?

Mr. EDISON. Well, for city deliveries, the terrible cost comes in in delivering from the farmer to the consumer (the man who eats the stuff), it is at present too expensive. I think we can cut it in two.

The CHAIRMAN. For long distances, such as railroad and street car transportation.

Mr. EDISON. I have never studied it.

The CHAIRMAN. I want to know what are the possibilities of improvement of storage batteries, and whether it is possible that it may be carried into long distance transportation. I want to know whether such a thing is practical or not.

Mr. EDISON. No; it is for city delivery.

Senator McNARY. Is it not true that the excessive weight of the batteries is one of the handicaps of the business.

Mr. EDISON. Twenty miles each way, total 40 miles. That is the limit of the storage battery, commercially speaking. If you want to go farther you have to have the gas machinery.

The CHAIRMAN. Do you think the inventive genius will bring about an extension of that?

Mr. EDISON. Oh, yes. We don't know anything about that. It is bound to come.

Senator McNARY. The weight is one of its handicaps?

Mr. MEADOWCROFT. The matter of weight is met by his particular battery, because he gives over twice as much for the same weight as the lead storage battery.

The CHAIRMAN. Tell us something about cement. You started to speak of that a while ago.

Mr. EDISON. Well, I have a cement works, and the whole crowd of cement manufacturers have been competing and cutting each other's throats, and one or two of them have made 5 per cent, because they got a special kind of stuff, and now we are being sued under the Sherman law. I said it didn't amount to anything, because if a lot of people are together and they have never made a dollar, that is prima facie evidence that there is not a combination; but Mr. Daugherty thinks there is, and so he sued us.

Senator HARRIS. A combination, then, is all right so long as they don't make a profit? The question of tariff on cement is being debated over in the Senate to-day.

Mr. EDISON. The tariff business—look out. It's poison.

Senator HEFLIN. How far are those potash beds that you spoke of from Muscle Shoals?

Mr. EDISON. I was looking for the scale of that map over there on the wall. I don't see it. I guess it is only about 80 to 125 miles. You can run a wire over there.

The CHAIRMAN. That is all, unless you have something further to say, Mr. Edison.

Mr. EDISON. I worked in Washington during the war. I got pretty familiar with what was being done, and I was told not to say anything to Congressmen. That looked rather fishy, and I found out after a while that a lot of those fellows that were running the details of this Government were false; they were not the real thing; they were counterfeits. I am surprised that you don't draw your bills differently. Draw up a skeleton of your bill and specify the initial thing you have to do, and when that is done you will find out what the first step costs. Now, go ahead and continue it on by supplement, so you will know the progress of all your legislation and make them show up in between each supplement. You would have saved five or six billion dollars here and you would not have got a lot of these inefficient people. It comes in sections and each time they come for more money you make an amendment to the act. Let them have it, but they have to show up. Under the war administration nobody had to show up. You will have it showed up by and by. I am sure you use wrong methods. You should always pass a bill that contains just the rudiments of the entire bill; then you have to have the first start, the instrumentalities you start with to make that thing function, and spend several million dollars. When you have got through the first stage let them come to Congress and get the additional legislation to go ahead a little further, and when you have gotten through an examination of what has been done you will know if there is anything rotten in that, because you will see how all the money has been spent. But the way you do it now you make the bill and quit and never hear anything, and you try to get some information and you don't get any at all. They double-cross you all the time.

Senator HARRIS. You are right about that. You want to make legislation a progressive science?

Mr. EDISON. It is not dishonesty; it is inefficiency.

The CHAIRMAN. We appreciate your presence, Mr. Edison, and are very much obliged to you.

(Whereupon, at 12.45 o'clock p. m., the committee adjourned until 10.30 o'clock a. m. Monday, May 22, 1922.)

MUSCLE SHOALS.

MONDAY, MAY 22, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), Capper, Ladd, Norbeck, Kendrick, Harrison, and Heflin.

STATEMENT OF MR. HUGH L. COOPER, CONSULTING ENGINEER, STAMFORD, CONN.

The CHAIRMAN. First give your name and occupation to the stenographer for the record.

Mr. COOPER. My name is Hugh L. Cooper; I live at Stamford, Conn.; and I am a consulting engineer, specializing in the building of hydroelectric power plants.

The CHAIRMAN. Give the committee, just briefly, a short history of your life work—where you were educated, first, and what your connection has been with the development of various water powers.

Mr. COOPER. I have had no college education. I am a graduate of an ordinary Minnesota country high school. I went to work as a common laborer thereafter, and what little I know has been gathered by night study and day practice.

The CHAIRMAN. That ought to make you a very valuable witness here.

Mr. COOPER. I began 30 years ago in the building of dams, when the hydroelectric industry was in its infancy, and since that time I have been building various power plants in different parts of the world, totaling something over a million horsepower of plants that have either been designed by me and constructed by me or designed and partially constructed by me. Among these plants are one in Brazil, amounting to 40,000 horsepower; one in Chile, amounting to 34,000 horsepower; one in Canada, at Winnipeg, 40,000 horsepower; Niagara Falls, Canada, 150,000 horsepower; McCall's Ferry, Pa., 125,000 horsepower; the Mississippi River, at Keokuk, Iowa, 200,000 horsepower; and various other plants, filling in the residue of a million horsepower. I have built 12 or 14 dams and have been consulting engineer on a good many other plants that I have not built.

Mr. COOPER. Fifty-seven.

The CHAIRMAN. Now, Mr. Cooper, you know, of course, what we are considering, and we would be glad to have you, in your own way, tell us what you know about it. Give us your opinion in regard to the various questions connected with the development of power at Muscle Shoals.

Mr. COOPER. Will you depend, Senator, on the House record as to just what my relations with the job have been, or shall I tell it to this committee?

The CHAIRMAN. You had better tell it to this committee.

Mr. COOPER. When I was in the service in France I was ordered home by the Secretary of War in the beginning of 1918 to build what is called Wilson Dam at Muscle Shoals. I remained on the work at this dam about two months, when General Pershing ordered me to return to France for port work. After the war was over and some three or four millions had been spent on the work the present Chief of Engineers asked me to take over the design of the work and the inspection thereof, principally because the plans they were following were plans that I had made when I was in the service, and those plans were radically different from the original plans that had been prepared by the Army engineers for this undertaking. After some consultation with the Chief of Engineers I could see the embarrassment that he was in because of the carrying

out of specific plans that another man had made, and because of their being so radically different from the original plans, and I also saw my own embarrassment in going on with the work on the question of a fee. My own fees are, in private practice, very much larger than any government pays. I have two schedules of fees in private practice, one of which schedules is a per diem of \$250 a day and expenses, together with a charge for all the labor that is employed by me in the engineering work, plus 60 per cent on the cost of that labor for overhead, plus a charge of 25 per cent for a profit. That is the minimum fee I receive for work in private practice. The maximum fees vary from 4 to 6 per cent of the total cost of the work, out of which I pay all of the engineering expenses and cost of purely engineering work.

In order to not embarrass the Chief of Engineers I told him that I would make the charge the lesser of these two systems of charge, except that in the case of the Government I would not charge any profit; I would stop at 60 per cent overhead. Realizing that anybody who attempts to have any contractual relationship with any government is apt to find himself annoyed by such a contract, I put in the contract that either party could cancel the contract on 30 days' notice, and that stipulation is still in the contract.

Recently various statements have been made to the effect that there was some doubt as to the integrity about the statement of no profit and that I was making a great profit and all that sort of thing. I hereupon asked the Chief of Engineers to have my books audited and discover whether I was actually truthful when I told him what my charges were. As a result of that request the Chief of Engineers has had the accounts audited of several jobs, one, amongst others, of a foreign government, and the result of that audit is shown on photostat copies of correspondence between Col. Edw. Burr, district engineer, New York City, who made the investigation, and the Chief of Engineers, and I will be very glad to leave a photostat copy of this correspondence for this record if you wish it.

The CHAIRMAN. All right. We will be glad to have it in the record.

(The correspondence referred to is as follows:)

WAR DEPARTMENT,
UNITED STATES ENGINEER OFFICE,
New York, N. Y., April 29, 1922.

Misc. 638/54

From: The District Engineer, First District, New York City, N. Y.

To: Chief of Engineers, U. S. Army.

Subject: Wilson Dam.

1. In accordance with instructions received April 28th over the telephone from Brig. Gen. Harry Taylor, Assistant Chief of Engineers, I have caused an examination to be made of the accounts and records of Hugh L. Cooper & Co., consulting engineers, No. 101 Park Avenue, New York City, N. Y., with respect to the charges made by them for engineering services rendered in connection with the Wilson Dam at Florence, Ala., under their contract made with the Chief of Engineers, U. S. Army, for the rendition of such services.

2. This examination in detail was made by Mr. Jos. S. Beran, clerk accountant in charge of the finance subsection of this office. Mr. Beran is an experienced accountant and I have every confidence in his capacity and reliability, nevertheless, in view of the circumstances under which this examination was directed, I have caused him to submit the results of his examination in the form of an affidavit for better verification of the facts desired. The said affidavit is transmitted herewith.

3. Messrs. Hugh L. Cooper & Co. placed at Mr. Beran's disposal all records in their office necessary for the purpose of his examination. The said records were sufficient to verify fully the facts reported by Mr. Beran to the effect that Hugh L. Cooper & Co. have not made any charges against the United States for services in connection with the Wilson Dam other than as provided in their contract above mentioned and that they have not included in the said charges against the United States any profits such as it is their custom, and the custom of other consulting engineers, to charge for similar services rendered to other parties, nor has any charge been made by Hugh L. Cooper & Co. for the services performed by Mr. Hugh L. Cooper or any of his designated representatives as is customary by the Hugh L. Cooper & Co. to charge other private corporations, enterprises, etc., on the basis of \$250 per day, or on any other basis except that of reimbursement of actual traveling expenses at the rate of \$40 per day.

EDW. BURR.
Colonel, Corps of Engineers.

STATE OF NEW YORK,

County of New York, ss:

Personally appeared before me, the undersigned, a notary public in and for said county and State, Joseph Stanley Beran, of Bogota, 9 Ridgfield Avenue, County of Bergen, State of New Jersey, who, after being duly sworn, deposes and says as follows:

In accordance with instructions given me by Col. Edw. Burr, I visited the office of Hugh L. Cooper & Co., 101 Park Avenue, New York City, on April 28, 1922, for the sole purpose of inspecting and verifying certain matters of facts relative to this corporation's charges to the United States Government for services rendered in connection with the so-called "Wilson Dam project," as compared with their charges to other private enterprises or projects for rendering similar services. For this purpose the Hugh L. Cooper & Co. gave me full and free access to their books, records, and files.

A copy of the contract between the United States Government and the above-mentioned corporation dated October 1, 1920, covering the rendition by this corporation to the United States of the above-stated services, was shown me; Mr. Hugh L. Cooper and Mr. R. D. Edsell, both members of this corporation assured me that said copy was a true copy of the original contract; this said copy bore original signature of an officer of the United States which is known to me and which satisfied me of the genuineness of this copy of contract. This copy of contract was given my careful perusal and scrutiny.

Further, carbon copies of all bills submitted the United States Government for services rendered under said contract were shown to me. Assurance was given me by the two members of said corporation, as above mentioned, that these carbon copies were exact duplicates of the original bills as submitted the United States Government. Verification of the genuineness of these carbon copies of bills and the satisfaction, acceptance, and payment in full by the United States Government of these bills was made by me by recourse to the proper entries of the amounts of these bills in all books, records, and bank statements. These bills were in full detail and were entirely in accord with the terms of said contract. These bills bore charges only for the payments of salary to assistants, as defined by said contract, plus an overhead charge of 60 per cent thereof, plus reimbursement of traveling expenses of said assistants and expenditures for purchase of certain materials and supplies, plus traveling expenses incurred by Mr. Hugh L. Cooper or representatives designated by him for special examinations or conferences at the Wilson Dam site, at Washington, D. C., or elsewhere (which happened to be certain members of said corporation) at the rate of \$40 per day only when so actually engaged. No other charges, either for profit or otherwise, were included in said bills.

Further, carbon copies of bills as submitted to three private corporations or enterprises (one a foreign government) were shown me. These three private corporations or enterprises are the only active accounts at this time of Hugh L. Cooper & Co., as indicated by their books and records and as assured me by the two members of this corporation above mentioned. Assurances were given me that these carbon copies were exact duplicates of the original bills as submitted to these three private corporations. The genuineness of these carbon copies and the satisfaction, acceptance, and payment in full of said bills, was verified by me by recourse to the proper entries of the amounts of same in all books, records, bank statements, and deposit slips. Some of the bills antedated the contract heretofore first mentioned. The bills are in full detail and show that the charges of Hugh L. Cooper & Co. for services performed were as follows:

A charge of \$250 per day for services rendered by Mr. Hugh L. Cooper on days when so actually engaged.

Full reimbursement of payments of salary of all assistants and employees so engaged, plus an overhead charge of 60 per cent, plus 25 per cent of the total of such said payments of salaries of assistants, etc., plus the 60 per cent overhead.

Full reimbursement of traveling expenses of all individuals so engaged, plus expenditures for purchase of materials, supplies, etc.

The accounts of Hugh L. Cooper are periodically examined and audited by The Audit Co. of New York, and a full statement rendered by The Audit Co. of New York, of recent date, was shown me.

I have been reasonably satisfied that Hugh L. Cooper & Co. have charged the United States Government for services rendered only on the basis of actual

cost to them in accordance with all the terms of the contract between them and the United States Government; that said actual cost to them were payments of salaries to assistants and employees (as defined by said contract), plus the usual and common charges of 60 per cent for overhead, plus the actual traveling expenses of such assistants and employees and reimbursement of actual payment for purchases of materials, supplies, etc., and the payment of actual traveling expenses, at the rate of \$40 per day, incurred by Mr. Hugh L. Cooper or his designated representative. That no charges were made for profit, either on the basis of their customary charge of 25 per cent to all other private corporations, enterprises, or projects, or in any other wise; also that no charges were made for services performed by Mr. Hugh L. Cooper or any of his designated representatives as is customary by the Hugh L. Cooper & Co. to charge other private corporations, enterprises, etc., on the basis of \$250 per day, or on any other basis except that of reimbursement of actual traveling expenses at the rate of \$40 per day.

(Signed) JOSEPH STANLEY BERAN.

Sworn to and subscribed before me this 29th day of April, 1922.

(Signed) GEORGE G—— (undecipherable).

Mr. COOPER. So much for my contractual relations with the Government. Senator CAPPER. May I ask if you have settled with the Government for your services, yet?

Mr. COOPER. I am settled with every 30 days. I submit an account to the Government which is audited by the Government every 30 days, and they pay it.

There has been some little feeling on this work from time to time as between Government engineers and private engineers, and some of this feeling may or may not be well founded, but in view of my belief that the building of this dam is an exceedingly difficult engineering undertaking, I have had to make insistencies in supporting my own judgment with respect to the character of the foundations and design of the structures that would be placed thereon that may be considered ultraconservative. Before I am through testifying this morning I am going to make what I hope will be considered at least a practical and unselfish suggestion with respect not only to my service with the Government, but what I think the Government ought to do with Muscle Shoals at this juncture. My own ideas as to what ought to be done at Muscle Shoals are different, I think, so far as I know, from anyone's ideas that have been before you, and they are not very long, and I want to tell you of them, if I may, a little later.

Before dismissing this subject of the difficulties at Muscle Shoals, I want to briefly state that the difficulties of an engineering kind at Muscle Shoals relate almost entirely to unsatisfactory foundations, by which I mean that it is difficult to make them safe, but it is entirely practical to make them absolutely safe. Because they are a limestone as opposed to granite, they require much more experienced handling. I think also the committee should understand that the Muscle Shoals Dam, when it is finished, will be the largest and most ambitious attempt at an overfall dam in the history of dam engineering in the whole world. The quantity of water that will flow over the top of the Muscle Shoals dams will be three times the maximum discharge of the Niagara River, and when we couple this fact with the fact that this dam is not founded on an igneous rock like granite but on a stratified rock foundation, containing specific and known seams or interstices below foundation lines, you come immediately to discover that you have not an ordinary problem, but an extraordinary problem. With that statement I will pass on to something else, unless you want to cross-examine me or ask some questions.

Senator KENDRICK. I want to ask you, Colonel, what, in your opinion, will be the effect of this structure in that stratified form? Will it not tend to close up the seams?

Mr. COOPER. It will, unless we properly fill them.

Senator KENDRICK. Unless they are filled. My idea was that perhaps the very weight—increased weight—on that formation would have a tendency to seal up any crevices?

Mr. COOPER. The interstices vary so much in thickness that, unless they were properly filled, you would have settlements that would crack your dam and you would lose it. These interstices are not small, but they vary up to 4 inches in thickness in some places, and up to a foot in others, and it would be absolutely impossible to contemplate the founding of a dam on such a set of strata until that you had previously filled these interstices so that the strata me together or slide on one another.

Senator KENDRICK. Is it your opinion that the borings already made would not have revealed crevices?

Mr. COOPER. They only partially revealed them. They never do fully reveal them.

Senator KENDRICK. Your contention is that the crevices might be perpendicular, and the borings being perpendicular—

Mr. COOPER. Might miss it.

Senator KENDRICK. Yes; might miss it.

Mr. COOPER. That is true in some cases.

The CHAIRMAN. I don't want to interfere with the outline which you expect to pursue in giving your testimony, but unless later on you do expect to go into that, I would like to have you go into it now or, at least, at some time during your testimony. In other words, the committee are exceedingly anxious to know whether, in your judgment as an expert, there have been any mistakes made there as to the foundation and whether there are any being made. We don't want to take any chances, of course, of that dam going out, or some accident happening to it. We want to know whether or not the work is being properly done and has been properly done so far.

Mr. COOPER. It is my opinion that the work has been properly done so far and that an absolutely safe structure can be completed there; but I am going to suggest to you to-day that because of the importance of the stability of that structure you should have another independent expert, or a number of experts, come in on this work and see whether Cooper is right or wrong in their opinion. It is too important to be placing all the confidence on one man.

The CHAIRMAN. Well, have you been in harmony with other engineers—the Government engineers, for instance—as to the preliminary work done in securing a foundation for the dam?

Mr. COOPER. Well, I was not in harmony with Col. Lytle Brown. I was very much in disharmony with him about foundations and everything else; but since he was transferred there has not been anybody to have any disharmony with. As a matter of practical fact, I am the chief engineer of this work, reporting to General Beach, the Chief of Engineers.

The CHAIRMAN. You have advisers, of course, and the Government engineers are working with you.

Mr. COOPER. No. I represent the Chief of Engineers. There is no other engineering responsibility down there except mine.

The CHAIRMAN. For instance, in what capacity is Colonel Barden?

Mr. COOPER. His responsibility relates solely to construction and finance, comparable to that of a contractor.

Senator KENDRICK. Supervising construction?

Mr. COOPER. He is the constructor.

The CHAIRMAN. I take it you are the supervisor?

Mr. COOPER. I am the supervisor. I have to pass upon the quality of the work Colonel Barden does.

Senator KENDRICK. I assume that Colonel Barden is not on the job under contract. That is not what you mean by a contractor?

Mr. COOPER. No, no; but he performs the duties of the work that a contractor would do. I am the supervisor. I represent the Chief of Engineers, General Beach. General Taylor is actually in command.

Senator KENDRICK. How far down have you gone in finding a solid foundation? In a great part of the dam is the foundation level across the river?

Mr. COOPER. The strata dips north and south somewhat but the character of the rock in the strata is very satisfactory. The difficulties are those inherent because of the interstices between the strata, and the resulting need to make sure that these interstices are filled. I have established a system that I am sure will take care of all of that, but when you come to realize what would happen to the community down there and to the Government and the people and to property, as to whether or no what I have provided for is sufficient, I think that the recommendations I am going to make later should be carried out and that all my work should be investigated to make sure.

The CHAIRMAN. Would it be a practical proposition now in parts of the dam, for instance, the one part that has been practically completed, and is it so that you could rectify it in case the investigation would develop that there was something wrong with it?

Mr. COOPER. Yes, sir. That is what I contend. I am sure that if somebody else comes along and proves to the Government that I have been remiss I have not gone so far but what my remissness can be corrected.

Senator KENDRICK. Right there, Colonel, I want to ask you this question.

With such diligence as you no doubt have brought to bear on the situation, and with such judgment as you have, which is probably mature, is it likely that any investigation such as a board of experts would pursue would determine any fault in your conclusions?

Mr. COOPER. I am sure my plans will be approved.

Senator KENDRICK. Assuming that they are, even so, is it not more than likely that your fault would occur in the structure underneath this dam in places and in ways that could not be found on the surface, except by the square test of pressure of this water?

Mr. COOPER. Faults such as you mention would show up in the records and be discoverable from the inspection gallery in the dam. Were you in it?

Senator KENDRICK. No; I was not in the gallery.

The CHAIRMAN. Not inside of the dam.

Mr. COOPER. Did you see that big tunnel in the dam?

The CHAIRMAN. No.

Mr. COOPER. Somebody ought to have shown it to you; perhaps it was under water.

Senator KENDRICK. Yes; I would like to have seen it.

Mr. COOPER. There is a huge tunnel in the middle of that dam, which we call an inspection and observation tunnel, from which all of the questions that you have brought up can again be determined at any time.

Senator KENDRICK. Now, Colonel, here was the idea that occurred to me about it. Suppose that there was a fault in the structure on which the dam rested, would it now be possible for that fault to run true from a point so far above the dam that you would never come in contact with it and still go clear under the structure?

Mr. COOPER. No. I see your point, and the answer to your question is this, that by the use of this observation tunnel and grout pipes that we put therein, we can seal all of these crevices not only immediately underneath the dam but for some distances up and down stream, and make them hermetically tight so that we do not care what the faults are above the dam. Do I make myself plain?

Senator KENDRICK. Yes.

Mr. COOPER. And we can prove by practical air pressure tests that we have succeeded.

Senator KENDRICK. The only thing in that, it seems to me—and if the chairman objects to prolonging this controversy I would like to have him say so—

The CHAIRMAN. No, no, Senator. That is perfectly proper. Go ahead.

Senator KENDRICK. The only thing, then, that would be involved in determining absolutely as to the reliability of that whole scheme, the dependability of it, and the solidity of the structure, would be overcome, as I understand it, as I believe, in going down in different places far enough to leave no doubt of it.

Mr. COOPER. We do that.

Senator KENDRICK. And not necessarily with a drill. It seems to me if it were found necessary it might be best to put pits down in that structure which would determine beyond a shadow of doubt, the drill might not disclose a narrow seam that would prove fatal.

The CHAIRMAN. Colonel, I think what Senator Kendrick is getting at is would it not be possible, say up above the dam, say half a mile above, that there would be a hole go down in the rock and go underneath and go under the entire structure and come up again below the dam?

Senator KENDRICK. No; that would not be the idea.

The CHAIRMAN. Is not that your idea?

Senator KENDRICK. No. My idea was if you penetrated below your supposed solid structure far enough you would undoubtedly disclose the presence of this seam if it were there, and that would indicate the danger so that it might be overcome and stopped; but if you depend altogether on drill holes the drill holes might not tell the story, as the Colonel has already indicated.

Mr. COOPER. Let me tell you why they do tell the story. We put down a test hole in any one given place, and we test that hole by forcing water or air to travel through the interstices to a second open test hole 20 feet away. We are putting down holes there every 20 feet, and when we test one hole we test it through being able to get reactions through the neighboring holes. We fill the interstices with grout or liquid cement under air pressure until the tests show that air or water can not be made to travel through the interstices, until the test holes hold their pressure.

Senator KENDRICK. Yes.

Mr. COOPER. And we cover the entire area, and I do not believe that a more careful set of tests was ever carried out than we are carrying out now.

Senator KENDRICK. Now, just one question more, Colonel: What depth below, we will say, the bottom of the river?

Mr. COOPER. Forty feet, and an occasional hole 100 feet.

Senator KENDRICK. What is the—

Mr. COOPER. Diameter?

Senator KENDRICK. No; I was going to ask what is the structure from the bottom of the river down? Practically rock?

Mr. COOPER. All solid rock.

Senator KENDRICK. It is? You go into that solid rock 40 feet?

Mr. COOPER. Yes, sir; with our explorations.

The CHAIRMAN. For fear I might forget it—it does not bear directly on the Wilson dam, but it does on the other one—I understand that the borings for Dam No. 3 have been completed?

Mr. COOPER. Yes, sir.

The CHAIRMAN. And they have been put down in the same way?

Mr. COOPER. Yes.

The CHAIRMAN. So that that location selected now, although no work has been done except the borings at Dam No. 3, the location there has been tested clear through?

Mr. COOPER. I understand so. I do not have any knowledge of my own about Dam No. 3 that is worth the consideration of this committee.

Senator KENDRICK. The plat that was shown us, Mr. Chairman, on the ground, indicated a double row of drill holes clear across the river.

The CHAIRMAN. Yes.

Mr. COOPER. Is that all on the engineering side that you think of?

The CHAIRMAN. Yes.

Mr. COOPER. Now, on the question of the proposals that are before the committee, I have taken the position heretofore and would like to retain that position, if it is agreeable to the committee, that I am not asked to recommend anybody's proposal. I do not want to be in the position, as long as I am the Government engineer here, of recommending anybody's bid for the Muscle Shoals property. I am perfectly willing to go the limit in telling you the faults, as I see them, in anybody's and everybody's proposal, but I do not want to be in the position of an advocate of anybody's proposal.

Senator KENDRICK. That is a perfectly consistent attitude.

Mr. COOPER. With reference to Mr. Ford's proposal, which is the only one I have studied—and I have not read any of the other proposals, and know nothing about them—I have come very reluctantly and regretfully to the conclusion in my own mind, based on 30 years' experience in the business and the engineering side of hydroelectric work, that Mr. Ford's proposal in its present form is a very bad thing from the public-interest standpoint and that it should never be adopted or accepted by the Government of the United States. It is the most extraordinary attempt at what I would call a raid on the Treasury that has ever come to my attention. As a matter of fact, it boils down to just this, that Mr. Ford, who is presumably one of the richest men in the world, is trying to borrow over \$80,000,000 at 2½ per cent interest from the Treasury of the United States, and with the money so borrowed he secures the uncontrolled use of the greatest water power the South has for 100 years, and I do not see any justification for it. It is my opinion that any disposal of the Muscle Shoals property should be limited as to its term certainly not to exceed 50 years, and it is my further opinion that the entire water power down there should be subject to official regulation under the terms prescribed by existing Federal law. These two dams create the greatest water power that the South has, and as a natural resource it is much greater than anything else they have, and because of the magnitude of these two dams this power has a tremendous bearing upon the peace and happiness and comfort and prosperity of millions of present and future people, and the proposal to hand out this great opportunity to an unregulated private individual and his heirs for 100 years and loaning money at 2½ per cent interest to harness this resource is most astounding to me.

Now, I know that this committee is anxious for facts. I have been coming before committees of Congress for 10 years, and the one impression I have always taken away with me is that every committee was really trying to get at the facts. I have never left a congressional investigation with any other

idea. But the difficulty you find is in telling the difference between the wheat and the chaff. Most of the facts you get are either not so, or are twisted around in a way that you can not tell just exactly what they do mean. I think in a question that is so highly technical as this question is, and so far-reaching in its influence on so many States and upon the Government, also, that it is literally impossible for any committee of Congress, with all the other work it has to do, to really get at a definite and safe result from reading the reports of this hearing. I want to conclude what I had in my mind to say this morning by making the following recommendation as to what this committee should recommend. First, appropriate the seven and one-half million dollars necessary for the next calendar year's work, failing in which the Government will lose over \$2,000,000, about a million dollars of which will be interest, and another million will be depreciation in the life of cofferdams which you can not artificially restore, and which cofferdams you will soon lose altogether.

You have been considering Muscle Shoals about 11 months, and, with all due respect, I do not think, because of the highly technical nature of this problem, that any set of men on earth would ever get anywhere if you held hearings and considered testimony 11 months more, with all the other duties that you have to attend to. I think you should refer the whole matter, after having provided the seven and a half million dollars to go ahead with, to the Federal Water Power Commission, with instructions to acquire, in the United States or elsewhere, a thorough, practical, and scientific report on Muscle Shoals from the best business and scientific and engineering experts that money can provide. Don't have the experts work for nothing. I think that seeking to impose heavy responsibilities (except in time of war) without normal compensation is one of the most foolish things any government does. Here we are, 108 or 110 millions of people, the richest people in the world, and trying to sponge brains. In so far as I have been able to learn from much inquiry, the Government of the United States is the only government in the world that pursues such a policy. The way to get results, in my humble opinion, is to hire a man for what his services are worth in the open market and pay him for them, and then demand and get results that can not come in any other way.

I would have the Federal Power Commission provided with at least \$50,000 (one-tenth of 1 per cent of the cost of Dam No. 2 alone) to go to the bottom of this question. The Muscle Shoals solution requires technical, highly trained ability in several lines of work, and you are going to make a mistake if you do not get all the facts and have them intelligently studied and reported upon. After the Federal Power Commission gets all of the facts in this way, I would have the commission report back to Congress its recommendations as to what ought to be done. In no other way will Congress ever have the information upon which it can depend. There are three things that I would have the committee of experts examine into. In the first place, I would have them examine into Cooper's relations to this entire project—the efficiency of his plans, the question of whether his present contract should be continued or canceled or whether or not he is too conservative or not conservative enough—I would have these matters passed upon by people outside of anyone who has had anything to do with the project upon to date. The next thing I would have the question of fertilizer and its needs in the country, and the best method to secure it thoroughly investigated by people who are not tied up to anyone that might be interested in this project. Then, I would have the business men come in and I would have them investigate the whole question from a cold-blooded business standpoint; and, then, of course, I would have the question of the value of this power to the general public—distributed as a commercial power and what the results would be that would come therefrom—investigated. With such a set of facts, as I am recommending, before Congress, certified to and proved up and secured in the way that I recommend, you would have something you could go forward with and be sure you were securing the greatest good for the greatest number.

Senator HEFLIN. How long would it take to do all of that investigating?

Mr. COOPER. I think it would take six to nine months to do it the way it ought to be done.

Senator KENDRICK. But, in the meantime, you would go ahead with the construction of the dam?

Mr. COOPER. Yes, sir; it is a crime to hold back this construction as it is to-day. The Government is losing \$2,500 a day every day you sit here and talk about it, and yet, of course, you must discuss it. You must all be convinced that the dam must be completed. Completed and devoted to intelligent

use Muscles Shoals will be a great addition to our national wealth, as well as a great aid to the South. This intelligent use, however, can not be determined by hearings of the kind now under way. The determination must be made with the unrestricted aid of experts devoting all of their time to the problem until it is solved.

Senator HEFLIN. How long since the Government quit work on the dam, Colonel?

Mr. COOPER. About a year and a half.

The CHAIRMAN. Just a year.

Mr. COOPER. Just a year now.

The CHAIRMAN. Just about a year now.

Senator HEFLIN. Have you made any recommendations to the War Department, since the Government ceased work down there, as to what should be done with it?

Mr. COOPER. Done with what?

Senator HEFLIN. With the dam and the whole project?

Mr. COOPER. Yes; I made a recommendation to the Secretary of War about a year ago.

Senator HEFLIN. What did you suggest in that recommendation?

Mr. COOPER. Practically what I have told you to-day. I can put this recommendation in the record, if you want me to.

Senator HEFLIN. I missed part of this testimony, Mr. Chairman. I was called away.

Mr. COOPER. I made a report to the Secretary of War on March 14, 1921, following almost exactly the line that I am recommending to you to-day, and I will introduce this in the testimony, if you want it.

The CHAIRMAN. If anybody wants it in, or if you want it in, but otherwise—

Mr. COOPER. I think I would rather have it go in.

The CHAIRMAN. All right; it goes in, then. Just hand it to the stenographer.

Senator HEFLIN. Have you made this recommendation that you have just told us about, about the committee?

Mr. COOPER. No.

Senator HEFLIN. You have not suggested that before?

Mr. COOPER. Not to anybody. I have been moved to my suggestion about a committee of experts because I have been seeing the way the testimony of witnesses has accumulated. No person can read all this great mass of testimony understandingly and think of a hundred other things and get the right solution for the problem before him.

(The report referred to is as follows:)

NEW YORK, N. Y., March 14, 1921.

HON. JOHN W. WEEKS,

Secretary of War, Washington, D. C.

DEAR MR. SECRETARY: At the time of my interview with you in your office on March 12, 1921, you asked me the following questions and received the following replies thereto relating to the Muscle Shoals development in the Tennessee River, at Florence, Ala.:

1. Question. What is your relation to this Muscle Shoals work?

Answer. I am the consulting engineer for this work and under the direction of the Chief of Engineers. I am making all of the plans and supervising the inspection of all permanent work, and am furnishing this service on the basis of cost without profit.

2. Question. How did you come to accept the position of consulting engineer for this work for the United States Government on such a basis?

Answer. When I was on duty in France during the war I was ordered home by the Secretary of War to build this dam as a war measure. After I had been at work on the dam for about six weeks I was ordered back to France by General Pershing. When the war was over, because of the desire of the Chief of Engineers to follow recommendations I had made when I was in the service, he asked me to continue as consulting engineer for the Government, and this I have agreed to do under a contract that can be terminated by either party on 30 days' notice.

3. Question. Have you had in the past, or have you in contemplation in the future, any relations with any utilities or chemical companies that would be interested in purchasing the power that will be produced by this dam should it be finished?

Answer. No.

4. Question. What is the conservative amount of power that can be developed from the Muscle Shoals plant, and upon what sort of data is your estimate of this amount of power based, and what will be the comparative cost of the energy produced if all existing estimates are verified in actual performance?

Answer. I have made a careful investigation of the Government records of flow in the Tennessee River at Florence, Ala., covering a period of 21 years, and have checked the rating curve used by the Government in its flow determinations.

I find that the plant should be developed for a gross installation of 550,000 horsepower, 100,000 of which will be practically uniform throughout every year, and the balance of 450,000 horsepower will be available for periods of time varying from 4 months to 11½ months of the year. The gross output of the plant when finished as now designed will conservatively produce 700,000,000 kilowatt hours per annum for all the year, or primary power, and 1,470,000,000 of part-time or secondary power. The above sums of energy are equal to an average of 382,000 horsepower per annum, making the proposed installation the largest on the American continent.

The estimates show that the primary power can be sold at 4.4 mills per kilowatt hour and the secondary power at 1.32 mills per kilowatt hour. These are prices that are very low in comparison to steam costs in this territory, and I am of the opinion that a combination of public utilities can be found willing to contract for this energy on terms that will eventually net the Government 5 per cent interest on the money that will be required to complete the plan.

The above figures pay for the navigation improvements, leaving nothing to be charged to navigation whatever.

5. Question. What is the total amount of money that will be required to finish the plant according to present plans?

Answer. \$50,000,000.

6. Question. Is this estimate of \$50,000,000 an absolutely safe estimate, and why?

Answer. The estimate is safe and ultraconservative because it is based upon unit costs developed in the expenditure of the \$16,000,000 already in the job, and because it is based upon foundations and quantities to be built thereon which are now known and not subject to the usual construction hazards. In addition, the \$50,000,000 estimate carries liberal allowances for contingencies, and I have no hesitancy in saying that the \$50,000,000 amount is safely an outside figure.

7. Question. What amount of money is now invested in the Muscle Shoals project?

Answer. About \$16,000,000.

8. Question. How much money will be needed to put the plant in commercial operation according to the plans you are now following?

Answer. \$27,000,000.

9. Question. Do I understand you that all of the costs in your estimate of the locks and their approaches are charged to the power development, so that if your present plans are carried out the power produced will pay for the cost of the navigation improvement at this point?

Answer. Yes.

10. Question. Supposing that the Government, with the \$17,000,000 appropriation now available for this dam, were to say to private capital, "You can have all of the work that is now in place if you will finish the project." Do you think private capital would be found which would accept the undertaking on this basis?

Answer. No.

11. Question. Why?

Answer. Because of the abnormal amount of money required to finish the project and the inability of private capital for some years to come to secure money at anything like a rate to compete with the Government's ability to borrow the money at a low rate during the same period.

12. Question. How much loss would the Government sustain if the work were shut down at this time for a period of three years and then undertaken and completed?

Answer. Approximately \$4,500,000.

13. Question. If the work is not interrupted in the future, when do you estimate the first 100,000 horsepower will be ready for commercial use, and how long a time have you estimated will be required to sell all of the energy?

Answer. The first installation of 100,000 horsepower should be ready for commercial use January 1, 1924. I have estimated that by 1935, if the energy is sold to public utilities, the entire amount of power will then be in use.

14. Question. What do you recommend the Government should do at this juncture?

Answer. The Government should provide \$10,000,000 for the current year's work at Muscle Shoals, and carry on the project up to an ultimate expenditure of \$43,000,000. At the end of the expenditure of \$43,000,000 the navigation improvement will be completed and 100,000 horsepower will be installed and available for commercial use.

15. Question. What do you recommend the Government should do with this plant if it should finish it?

Answer. I am opposed to Government ownership and operation of any and all business. I recommend that the power created by the dam be leased either to public utilities in contiguous territory or leased to other private companies or corporations engaged in chemical or other operations that can make a better showing in the public interest than the public utilities can make. In this way the Government can avail itself of competition as between public utility companies on the one hand and chemical and fertilizer companies on the other. The war has produced great advances in chemistry requiring large quantities of electrical heat, and the Government through control of the energy that can be here created can, if competition is availed of, make an appropriate selection of the best use of this power for the good of the greater number of people.

16. Question. If the Government should finally decide to finish this work, what agency should administer the project when it is finished?

Answer. The Federal Power Commission, consisting of the Secretaries of War, Interior, and Agriculture. Subparagraph E of section 10 of the Federal water power law provides that the Federal Power Commission may issue licenses for such a condition as will obtain at Muscle Shoals if the Government desires to finish this work and thereafter lease its energy.

17. Question. If the Government should finally decide to lease the power from this dam to public utilities, what rate of interest do you think could be secured to the Government?

Answer. When the first installation, costing not to exceed \$43,000,000, is in commission, the Government return will be at the rate of 3½ per cent according to the estimate I have made. When all of the energy is sold, after an additional governmental expenditure of \$7,000,000, the total net earning to the Government will be safely 5 per cent per annum, with all operation and depreciation charges taken care of by the licensee.

18. Question. What do you think is the next move the Government ought to make in this matter?

Answer. The Federal Power Commission ought to go to Muscle Shoals and study this problem on the ground. Such a study should be supplemented by a careful check up of all of the facts relating to this project, and the Commission has appointees of its own who are capable of making such a check. After such a check is in hand the Federal Power Commission should make its recommendations to the President and the Congress of the United States in the premises.

19. Question. If no money had been spent on this project at all would you recommend the Government building it?

Answer. No. I am opposed to the Government ownership or Government in business. The Government has enough to do to attend to purely governmental matters.

20. Question. Then why do you recommend that the Government put in \$26,000,000 in addition to the \$17,000,000 now appropriated?

Answer. Simply because I do not think it good business for the United States to lose \$17,000,000 that can be saved in a perfectly practical way.

21. Question. How large a power territory is reachable from this plant, and what influence has the Muscle Shoals plant on this territory?

Answer. About 60,000 square miles located in seven states. Power developed in this territory by private capital will be halted until the final program with reference to the Muscle Shoals dam is decided upon, and if this final program does not encourage private capital in this territory, there will, of course, be no further water power developed in this territory under such conditions.

22. Question. Why not make an arrangement with the public utilities now and use this arrangement as a basis for further expenditures by the Government if the plant must be finished by the Government?

Answer. Such an arrangement can undoubtedly be made, but such a arrangement will close the door, in my judgment, to future competition as between public utilities and developments in chemistry, and such a closing of the door would undoubtedly be against the public interest.

Very truly yours,

(Signed)

HUGH L. COOPER.

Senator KENDRICK. You do recommend to the Secretary of War—

Mr. COOPER. That we proceed with the work?

Senator KENDRICK. That we proceed to construct or finish the dam.

Mr. COOPER. Yes.

Senator KENDRICK. But they did not adopt your suggestion?

Mr. COOPER. No.

The CHAIRMAN. Congress did not appropriate the money?

Mr. COOPER. Congress tried to appropriate the money and did come within a few votes of passing the appropriation in the House.

Senator HEFLIN. It passed the Senate.

The CHAIRMAN. The work stopped because Congress did not appropriate any money to continue it. As you say, the appropriation passed the Senate, but it was defeated in the House.

Senator HARRISON. It lacked seven—six or seven—votes in the House.

The CHAIRMAN. Yes.

Colonel, you stated, when you were speaking of Mr. Ford's proposition, the only one you have studied, that in effect it was borrowing money from the United States Treasury at 2½ per cent interest. I wish you would explain just how you reached that conclusion.

Mr. COOPER. I will offer in evidence here a letter which I wrote to the various members of the Military Affairs Committee of the House on February 21, 1922, wherein all of the figures and facts are specifically laid down, so that anybody can read and find out exactly what it amounts to.

The CHAIRMAN. In that letter you give your reasons for that conclusion?

Mr. COOPER. Yes; and quote all the facts.

The CHAIRMAN. I expect we had better have the letter read.

Senator KENDRICK. Yes; it would not be a bad idea.

The CHAIRMAN. You can read it, or we will have somebody else read it.

Mr. COOPER. I will read it.

"NEW YORK, N. Y., February 21, 1922.

"Hon. JULIUS KAHN,

"Chairman Military Affairs Committee,

"House of Representatives, Washington, D. C.

"DEAR SIR: 1. Agreeable to the promise I made to the House Military Affairs Committee on Friday, February 17, I desire to submit the following analysis justifying the statement I made before the committee that the cost to the United States Treasury would be in reality \$1,275,000,000 over and above the amount of money received from Mr. Ford should Mr. Ford's proposal be accepted as now before the committee.

"2. The above figure of \$1,275,000,000 was arrived at, as stated in my testimony, by compounding the 4 per cent interest charge annually."

Later I found that the interest was always computed semiannually, and I recomputed it on the semiannual basis and produced the figures which I will now quote:

"Since my return to my office I have ascertained that all money borrowed by the United States Government carries semiannual interest payments instead of annual interest payments. I have therefore recomputed this Treasury deficit on the basis that the money borrowed for Dams Nos. 2 and 3 will cost the Treasury 4 per cent (2 per cent payable semiannually).

"3. In order that the committee may make a check of the figures quoted below, by referring them to the Treasury Department or any other department for verification, I desire to set down the following bases that were used by me in arriving at the total result, and these bases are taken from the formal contract proposed by Mr. Ford and from the cost of construction and carrying charges as estimated by the Chief of Engineers.

"4. Dam No. 2.—Basis (A). That Mr. Ford's 4 per cent interest payments, specified in paragraph 3 of his contract for Dam No. 2, will apply to \$50,175,000. January 1, 1931."

In other words, when he begins his full 4 per cent interest payment, with respect to Dam No. 2, the Government will have spent \$50,175,000.

"This \$50,175,000 is arrived at as follows:

Cost to date of Dam No. 2-----	\$17,000,000
Net accrued interest before full 4 per cent payments begin-----	8,175,000
Cost to complete Dam No. 2-----	25,000,000
Total-----	50,175,000

(Above figures are Chief of Engineers' estimates.)

"Basis (B). That this 4 per cent interest (2 per cent payable semiannually) on \$50,175,000 will run until January 1, 2025.

"Basis (C). That beginning January 1, 1932, Mr. Ford will pay annually into the Treasury of the United States, account Dam No. 2, \$1,000,000 (4 per cent annually on \$25,000,000).

"5. Using the above basis for calculation, I have assumed that the \$50,175,000 principal as of January 1, 1931, and the interest thereon, thereafter compounded at the rate of 4 per cent (semiannual payments of 2 per cent), would be credited by the \$1,000,000 annual payments made to the Government as and when they were made under the proposed contract. This method of crediting the payments direct to the account they are indebted to avoids the necessity of assuming that the Government would turn around and loan this money at 4 per cent.

"6. The above four assumptions—A, B, C, and paragraph 5—make a total unpaid cost of Dam No. 2 at the end of the lease period, which is January 1, 2025, of \$1,076,800.

"7. Dam No. 3.—Basis (A). Mr. Ford's 4 per cent interest payment, specified in paragraph 7 of his contract for Dam No. 3, will apply to \$33,000,000 January 1, 1931. This \$33,000,000 is arrived at as follows:

Cost to build Dam No. 3-----	\$25,000,000
Overflowed lands-----	2,331,000
New accrued interest before full 4 per cent payments begin-----	5,669,000
Total-----	33,000,000

(Above figures are Chief of Engineers estimates.)

"Basis (B). That this 4 per cent interest (2 per cent payable semiannually) on \$33,000,000 will run until January 1, 2028.

"Basis (C). That beginning January 1, 1932, Mr. Ford will pay annually into the Treasury of the United States, account Dam No. 3, \$1,000,000 (4 per cent annually on \$25,000,000).

"8. Using the above bases for calculations, I have assumed that the \$33,000,000 principal, as of January 1, 1931, and the interest thereon, thereafter compounded at the rate of 4 per cent (semiannual payments of 2 per cent), would be credited by the \$1,000,000 annual payments made to the Government as and when they were made under the proposed contract.

"9. The above four assumptions—A, B, C, and paragraph 8—make a total unpaid cost of Dam No. 3 at the end of the lease period, which is January 1, 2028, of \$409,100,000.

"10. The Treasury account against Dam No. 2 will show a deficit at the end of the lease period (see par. 6) of \$1,076,800,000. With reference to Dam No. 3, the deficit will be \$409,100,000, making a total Treasury deficit at the end of the lease period after crediting all of Mr. Ford's payments as called for by paragraphs 3 and 7 (Mr. Ford's contract) of \$1,485,900,000.

"11. During the lease period, as per paragraph 10 of Mr. Ford's contract, there is to be in operation two amortization funds, as follows: For Dam No. 2, \$19,868; for Dam No. 3, \$3,505; both payments being paid every six months, beginning with specified dates. These two sums for the lease period, if invested at the rate of 4 per cent (2 per cent compounded semiannually), will return to the Treasury approximately \$50,000,000.

"12. The net total deficit that the Federal Government must supply by general taxation, because of the failure of Mr. Ford's payments to foot the cost to the Treasury, becomes \$1,485,900 (par. 10) minus \$50,000,000 (par. 11), or a net deficit in the Treasury of \$1,435,900,000.

"13. I believe that, with the above data before you, you will be able to see—(a) that the method of computing the cost to the Treasury is the correct and practical method, and tells accurately what the effect on the Treasury and the taxpayers in the United States will be; (b) That you will find if this question is investigated the bases for calculation and the mathematics applied to the same are both correct."

"14. This letter does not cancel the statement made before the committee that the deficit would be \$1,275,000,000, which amount is correct for annual interest applied to the \$83,175,000 principal. The figures herein submitted are based upon semiannual interest payments on the same \$83,175,000.

"Very truly yours,

"HUGH L. COOPER."

Now, all of the details and all of the bases are clearly set forth, and they are subject to anybody's check, and I beg to assure you that you can not find any intelligent person who will say that they are wrong or that there is anything that is incongruous or unreasonable in any of the premises.

The CHAIRMAN. The only criticism, Colonel, that occurs to me offhand, or at first blush, is this—that you are taking the entire cost, for instance, the \$17,000,000 that has already been spent, and spent at a time when everybody was at the peak, that does not represent its worth. Everybody admits it is not worth what it cost. It seems to me if there is anything wrong with your figures it is that you have not deducted from the \$17,000,000 the difference between the \$17,000,000 and what it would cost to do that work now.

Mr. COOPER. My answer to that—

Senator KENDRICK. If I may interrupt, in other words, Mr. Chairman, it was your idea that the Government would not have proceeded to construct it at that time and at that cost, except under the pressure of war?

The CHAIRMAN. Yes. I think it is conceded that everything cost more than it would now, and a man buying it or renting it would not pay what it cost, but it is worth something, of course, and Mr. Ford does not count it at all in his proposition.

Mr. COOPER. My answer to that is this very important fact, that even counting the extra cost during the war, figuring the 4 per cent interest, on a basis including the \$17,000,000, you get power cheaper than you can get it anywhere else in the United States by a large percentage. The proof of this is in the record I have submitted.

Senator KENDRICK. Therefore it is a good investment and worth the money?

Mr. COOPER. And is abundantly able to carry more than 4 per cent on past expenditures plus expenditures needed to complete.

Senator KENDRICK. I am inclined to think so myself.

Senator HEFLIN. How much do you claim that Mr. Ford will pay to the Government altogether in a hundred years?

Mr. COOPER. His amortization claim—he amortizes \$50,000,000 and then he pays at the rate of 4 per cent on what the total cost to complete would be. I can give you the amount per annum.

Senator KENDRICK. Four per cent over and above what is already invested?

Mr. COOPER. Oh, yes.

Senator HEFLIN. He will have to pay a good deal more to the Government than the Government invested in the outset?

Mr. COOPER. No, no. Mr. Ford's proposal, if you want to get it down to very plain English, is to borrow money at 2½ per cent interest and thereby gain the cheapest water power on the American Continent for his sole and uncontrolled use for 100 years.

Senator HEFLIN. What I want to get at is, How much do you claim he will pay to the Government altogether from the time he gets it to the end of the hundred years?

Mr. COOPER. Well, I don't know as I can give you the grand total. He pays at the rate of about \$2,000,000 a year.

Senator HEFLIN. Then he will have to pay to the Government at the end of 100 years more than the Government originally put into the investment?

Mr. COOPER. Say that again.

Senator HEFLIN. I say at the end of a hundred years he will have paid back to the Government more money than the Government invested at the outset in the project?

Mr. COOPER. That may be very true; but in the meantime at the end of a hundred years the Government is \$1,435,000,000 out.

Senator HEFLIN. And the Government still owns the dam?

Mr. COOPER. Yes; but they have lost \$1,435,000,000.

Senator HEFLIN. Mr. Ford claims that he will make fertilizer down there. You say the water power is the cheapest that can be obtained—cheaper than can be obtained anywhere else?

Mr. COOPER. Yes.

Senator HEFLIN. Don't you think that will enable him to make cheaper fertilizer?

Mr. COOPER. I don't know enough about the fertilizer game to answer that question, Senator.

Senator HEFLIN. If he should be able to make fertilizers, would he not save during that hundred years, to the farmers of the United States, a great deal of money and would not the Government be justified in letting this dam out for such a project as that?

Mr. COOPER. Most assuredly; and you and I would get along fine there; but the trouble with your assumption is that there is no guaranty about it at all. I have been looking into the fertilizer business actively for 12 years, as have many others all over the world, and I can't find anybody that reliably and dependably knows anything about it.

Senator HEFLIN. Mr. Edison says that they are working it out.

Mr. COOPER. He does not know anything more about fertilizer than I do.

Senator NORBECK. Nothing more than the Agricultural Committee of the Senate.

Mr. COOPER. He does not know anything more about it than I do.

Senator HEFLIN. Mr. Edison says there is no doubt Ford can make fertilizers cheap there.

Mr. COOPER. With all due respect to Mr. Edison, if you knew the number of things he has said that haven't panned out you would not be carried away with his prophecies.

The CHAIRMAN. Colonel, I think it ought to be said, before you assume that unqualifiedly Mr. Edison did say that, that at least as I understood him he was considering there were going to be great improvements in time to time in the development of fertilizer and the extraction of nitrogen from the air, and so forth.

Mr. COOPER. Yes. Sure.

The CHAIRMAN. And he does not confine it to Mr. Ford any more than he does to anybody else. They are going to be able to make much cheaper fertilizer in the future than they have in the past. That is the way I understood it.

Senator HEFLIN. The question I had his assistant ask him was will Ford be able to make cheap fertilizers there for the farmers? and he said, "Oh, there is no doubt about it."

Senator NORBECK. Senator, you said cheaper fertilizer.

Senator HEFLIN. Yes. I said "cheaper".

The CHAIRMAN. He would have said the same thing about anybody making fertilizer. It was Mr. Edison's idea, as I gathered it, while he did not know anything about it himself, he knew that the human mind was working on the problem, and it was going to be greatly cheapened in the future. He didn't know whether he would make it there or somewhere else, or whether they would use power to do it or not.

Mr. COOPER. It is not three years since everybody thought the cyanamid was the greatest fertilizer discovery in the world. At that time cyanamid was the keynote of the whole fertilizer situation. It was the only way out. It is not two weeks since I talked with the greatest fertilizer expert in the world, and in the course of the conversation he said that the cyanamid process was in the junk pile and that he did not know what the new process was going to be. He told me of one venture in Norway where \$5,000,000 was invested under the direction of the finest brains that could be found in Europe, and yet they have gone into the hands of receivers because their process failed to produce the promised results.

Senator HEFLIN. Mr. Edison talked along that same line. He said there would be processes that would be invented that would make it cheaper and all. Mr. Ford claims to have a secret process.

Mr. COOPER. I know, but every man I have ever seen has at least one secret process and sometimes two or three. That is the way they have of dazzling the eye—the way they put up the smoke screen. Keeley had a secret process. I haven't any use for a fellow that won't put his cards on the table.

Senator HEFLIN. You would not want him to put his cards on the table before he got his patent, would you?

Mr. COOPER. Any process that is not by the patent stage and well along in the practical development stage will not be of much use to any of our living farmers as far as Muscle Shoals is concerned. I have nothing further to say, Senator.

Senator HEFLIN. You suggested about appointing a committee here and having experts examine the proposition, and business men examine it.

The CHAIRMAN. Will you just withdraw that until I follow up this other line a little further, and take that up later, because he is on this question of Ford's proposition.

Senator HEFLIN. All right.

The CHAIRMAN. As I understood you, Colonel, your claim is that the figures you have shown about the money that Ford would pay would, if computed mathematically, amount to the loaning of public money to Mr. Ford at 2½ per cent.

Mr. COOPER. Yes; that is true.

The CHAIRMAN. Now, in connection with that, and right while you are on that power proposition, I would like to ask you what it would cost the Government or anybody else to take care of Dam No. 2 and Dam No. 3 after they are completed. What would be the upkeep charge on it?

Mr. COOPER. In my opinion about twice what Ford is allowing.

The CHAIRMAN. About twice what he is allowing.

Mr. COOPER. Yes.

The CHAIRMAN. Now, another thing I think would be important for us to know. Take the ordinary commercial value of the power developed there, of the electricity, in your judgment what would that be worth? It is interesting and important to know just what the Government is going to have when it finishes this and how much it ought to get from anybody who is going to buy it or lease it.

Mr. COOPER. You mean to say for general distribution?

The CHAIRMAN. Yes. Suppose we just put it on a cold business basis—if you and I owned it, had it all completed now, what could we go out on the market and sell it for, or operate it and sell the power. How much would we get for it on the market?

Senator NORBECK. Assuming, Mr. Chairman, that you had a contract for the Government furnishing the cheap money in connection with it?

The CHAIRMAN. No; I was trying to clear away all the underbrush and everything. Supposing, regardless of its cost, what is it worth when we get it?

Mr. COOPER. I think all the year primary power would sell for \$20 a horsepower, distributed to local distribution companies, and that \$10 for the secondary power would be about right.

The CHAIRMAN. Have you made computations so that you can say what that would be in dollars and cents?

Mr. COOPER. No.

The CHAIRMAN. You could make that in a minute, couldn't you?

Mr. COOPER. You see that involves distribution lines also. You have to figure in distribution lines. I think maybe I could answer your question this way better, and give you a more precise bit of information to go on. My figures show that distributing companies can come to Muscle Shoals and build their own transmission lines and pay the Government for the current received a price that would net the Government 5 per cent interest on the whole investment. That is the conclusion that makes me cross when Ford offers about 2½ per cent for the loan of \$83,000,000, and a lot of good people thoughtlessly and under the influence of a very skilled propaganda exclaim, "Hail the miracle worker." They forget that this proposer is also the proposer of 12 or 15 power dams across the Mississippi River below St. Louis, a proposal absolutely impossible of consummation at any cost, and that he is the proposer of money based on kilowatts of energy and a lot of other proposals that, to say the least, are chimerical.

The CHAIRMAN. In round numbers that would be 5 per cent annually on \$50,000,000?

Mr. COOPER. Yes, sir; \$2,500,000.

The CHAIRMAN. Now, deduct the extent that you would—

Mr. COOPER. That is the net price.

The CHAIRMAN. That is net?

Mr. COOPER. Yes; that is net.

The CHAIRMAN. That is what I wanted to get.

Have you made any investigation, Colonel, in regard to the construction there on the Tennessee or its tributaries of dams for the purpose of impounding water?

Mr. COOPER. I have only made a general investigation, and such investigation as I have made shows almost conclusively that the value of the property would be increased, and will be increased at least 40 per cent by the construction of future sensible storages.

The CHAIRMAN. You have not taken that into consideration in your \$2,500,000?

Mr. COOPER. Not at all.

The CHAIRMAN. Or the probabilities are, assuming that your judgment is correct there, that by the proper construction of storage dams that income could be very greatly increased?

Mr. COOPER. At least 40 per cent.

The CHAIRMAN. I think that answers my question.

Now, Senator Heflin, excuse me for interrupting you.

Senator HEFLIN. Major Burns has some suggestions there.

The CHAIRMAN. Here are some suggestions, Colonel Cooper, made by Major Burns. First, the capital cost. I believe that is \$50,000,000, is it not?

Major BURNS. What I had in mind was to get the details in the record to substantiate this net return of 5 per cent according to Colonel Cooper's suggestion.

Mr. COOPER. It is already in this record.

Major BURNS. In this Senate committee record?

Mr. COOPER. Yes. It is included in that letter.

The CHAIRMAN. There is capital cost and operating cost and maintenance and depreciation. Are those all in?

Mr. COOPER. They are all in here; yes, sir. The whole story is in here.

You will be interested, I am sure, in knowing that even if Mr. Ford paid 4 per cent interest instead of 2½ per cent interest the cost per horsepower would still be 20 per cent lower than it is anywhere else on the American continent, and that is all shown in the testimony which I have given here at the House committee, and with all the details, and that can be put in evidence here.

The CHAIRMAN. I would like to have you put that in.

Mr. COOPER. I will put that in.

The CHAIRMAN. The whole thing or are there some parts that you want to mark?

Mr. COOPER. I will mark the parts that I want copied.

(The excerpts from the hearings referred to are as follows:)

PROPOSED FORD CONTRACT FOR MUSCLE SHOALS POWER.

STATEMENT NO. 1.—RE DIFFERENCE BETWEEN MR. FORD'S LEASE PAYMENTS TO THE UNITED STATES TREASURY AND THE AMOUNT THE TREASURY WILL HAVE TO PAY OUT IF MR. FORD'S PROPOSAL IS ACCEPTED AS WRITTEN.

1. In what follows, 4 per cent interest is assumed to be the best interest rate the Treasury of the United States can avail itself of during the next 100-year period, and it is to be noted that this 4 per cent rate is the base rate of all the calculation in Mr. Ford's proposal, and therefore this assumption can not be criticized as inharmonious with the letter and spirit of the Ford contract now before Congress.

2. I find that at the time Mr. Ford will begin the payment of a full 4 per cent interest return to the Treasury of the United States the sums expended by the United States Government up to this 4 per cent payment basis, as estimated by the Chief of Engineers, will be as follows:

For completion of Dams Nos. 2 and 3.....	\$50,000,000
Interest accrued during the construction prior to the beginning of the 4 per cent interest payments less interim interest payments made by Mr. Ford (War Department estimate).....	13,844,475
Previously spent on Dam No. 2 (War Department estimate).....	17,000,000
Cost of flowage rights for Dam No. 3 (War Department estimate).....	2,331,000
Total	83,175,475

3. For the purposes of a fair and parallel comparison I have assumed, in order to get a correct figure representing the loss to the Treasury in dollars, in this transaction, that the Treasury cost of the above total of \$83,175,475 at the rate of 4 per cent interest would be compounded annually for the lease period, thus producing a grand total of \$3,304,095,000 demand on the Treasury.

4. Investing the \$2,000,000 Mr. Ford proposes to pay into the Federal Treasury annually, which is 4 per cent of the estimated cost to complete the job, which estimated cost (United States Engineers' Department estimate) to com-

plete is \$50,000,000. Such a plan would return to the United States Treasury at the end of the lease period \$1,979,185,000.

5. This, you will note, results in a grand total deficit (excluding the amortization payments in paragraph 10 of the Ford contract) to the Treasury of \$1,324,910,000.

6. Mr. Ford's amortization payments, in paragraph 10 of his contract, are planned to amortize \$50,000,000 of the above deficit, leaving a net deficit for the Treasury to provide for of \$1,275,000,000.

STATEMENT NO. 2.—RE AMOUNT OF LOW-TENSION HYDROELECTRIC ENERGY DELIVERED TO GENERATOR STATION BUS BARS THAT WILL BE CREATED BY THE COMPLETION OF DAMS NOS. 2 AND 3 ACCORDING TO THE REQUIREMENTS OF MR. FORD'S PROPOSAL.

A kilowatt is $1\frac{1}{2}$ horsepower.

A horsepower is three-fourths of a kilowatt.

Primary power is power that is available 365 days per year.

Secondary power is power that is available for some fraction of 365 days per year.

The secondary power, mentioned below, will be available from a minimum of 4 months per annum to $11\frac{1}{2}$ months per annum.

1. When projects Nos. 2 and 3 are completed, and, making no allowance for the value of important storage reservoirs in the Tennessee River above Dams Nos. 2 and 3, that future public interest will require to be constructed, the capacity to be installed in projects Nos. 2 and 3 (No. 2, 600,000 horsepower; and No. 3, 250,000 horsepower) will produce an average annual kilowatt delivery to generator station bus bars as follows:

	Kilowatt hours.	
	Primary.	Secondary.
Dam No. 2.....	700,000,000	1,490,000,000
Dam No. 3.....	285,500,000	608,000,000
Total.....	985,500,000	2,098,000,000

2. The total annual energy (primary and secondary) supply from both stations will, therefore, be 3,083,500,000 kilowatt hours.

3. The average cost to Mr. Ford of the total energy in paragraph 2 is (see statement No. 3) \$3,622,246 annually, or at a rate of 1.18 mills per kilowatt hour, a cost far lower (about 50 per cent) than can be arranged for elsewhere on the American continent.

4. In average generator station practice in the American hydroelectric field secondary kilowatt hours are figured at about 50 per cent of the value of primary kilowatt hours.

5. On the basis of the relative values specified in paragraph 4, the costs to Mr. Ford for primary and secondary power become as follows:

985,000,000 kilowatt hours, at 1.81 mills.....	\$1,782,850
2,098,000,000 kilowatt hours, at 0.905 mill.....	1,898,690
Total.....	3,681,540

Mr. Ford's annual payment for the foregoing energy (par. 3) is slightly less than the above grand total, and therefore the use of the unit costs of 1.81 mills and 0.905 mill, respectively, for primary and secondary power is conservative.

It will be interesting to show now what the gross annual cost of \$3,622,246 as shown in statement No. 3, applied to the energy produced from Dams Nos. 2 and 3, as shown by statement No. 2, will yield as to costs per horsepower per annum for the various classes of power. Assuming 8,000 hours' annual use for 24-hour power and 5,256 hours' annual use for the best annual load factor (about 60 per cent) that can be built up in commercial work in the territory reachable from Muscle Shoals shows the following horsepower net costs to Mr. Ford:

(a) For 24-hour power annual cost, $8,000 \times 1.81 \text{ mills} \times 0.746 =$ (primary power), \$10.80 per horsepower.

(b) For 60 per cent load factor power annual cost, $5,256 \text{ hours} \times 1.81 \text{ mills} \times 0.746 =$ (primary power), \$7.10 per horsepower.

(c) For 24-hour power annual cost $\frac{2,221}{4} \times 10.80 =$ (secondary power), \$5.40 per horsepower.

(d) The total energy of 3,083,500,000 kilowatt hours, specified in paragraph 2, is equivalent to an average of 517,000 horsepower used 8,000 hours per annum. This 517,000 horsepower will cost Mr. Ford \$3,622,246 per annum, or at the rate of \$7.01 per horsepower, a price considerably less than one-half of what similar power can be secured for elsewhere on the American continent.

NOTE.—The foregoing amounts of energy were computed for a capacity of 550,000 horsepower for Dam No. 2. These energy amounts have not here been increased to correspond to the 600,000 horsepower capacity called for at Dam No. 2 in the Ford proposal. This omission will amply provide for the capacity needed to develop a 60 per cent load factor for primary power as above used.

7. The horsepower costs to Mr. Ford, as specified in paragraph 6, are approximately half the same costs at Keokuk and at Niagara Falls, on either side of the international boundary, and similarly are less than half the costs of the same class of energy in the commercial power territory reachable from Muscle Shoals.

8. It is apparent, therefore, that the Ford proposal calls on the Federal Treasury for \$1,275,000,000 during the next 100 years in order that Mr. Ford may secure sole unregulated possession of the greatest water power the South has and at a cost to Mr. Ford around one-half of what similar power is available for elsewhere on the American Continent.

STATEMENT NO. 3—RE OPERATION AND MAINTENANCE OF MUSCLE SHOALS WATER POWERS.

1. I estimate the annual cost to Mr. Ford to operate and maintain Muscle Shoals Dams Nos. 2 and 3, up to and including low-tension bus bars, will be:

Operation, 850,000 horsepower, at 60 cents per horsepower year----- \$510, 000

Repairs and maintenance:

For Dam No. 2 (specified in contract)-----	\$35, 000	
For Dam No. 3 (specified in contract)-----	20, 000	
		55, 000

Renewals:

Machinery in power house—

For Dam No. 2, to replace 18 units every 30 years, costing \$16 per horsepower installed, calls for an annual sinking fund, bearing 4 per cent interest, compounded annually, of-----	155, 000	
For Dam No. 3, to likewise replace units in this plant, requires-----	65, 000	
		220, 000

Buildings, etc.—

For Dam No. 2, replacement of power house, auxiliary buildings, intake gates, screens, etc., annual charge-----	18, 000	
For Dam No. 3, for similar replacements-----	7, 500	
		25, 000

Rental:

For Dam No. 2, 4 per cent on estimated cost to complete for 600,000 horsepower capacity, \$27,000,000-----	1, 080, 000	
For Dam No. 3, 4 per cent on estimated cost for 250,000 horsepower capacity plant, \$23,000,000-----	920, 000	
		2, 000, 000

(The above total of \$50,000,000 is the amount estimated by the Chief of Engineers as necessary to complete Dams Nos. 2 and 3.)

Taxes, 850,000 horsepower, at 90 cents per horsepower year----- 765. 000

(This charge includes local and State taxes only, as Mr. Ford's proposal, as written, excludes Federal Power Commission jurisdiction.)

Annual amortization payment called for in paragraph 10 of Ford proposed contract..... 46,746

Total yearly operating expenses after Dams Nos. 2 and 3 are completed..... 3,622,246

STATEMENT NO. 4—RE SHOWING IF 4 PER CENT INTEREST IS PAID BY MR. FORD ON TOTAL COST OF DAMS NOS. 2 AND 3, AND PAYS \$79,432 ANNUALLY TO AMORTIZE \$83,175,475, WHICH IS THE ABOVE TOTAL COST.

If Mr. Ford should amend his offer to pay 4 per cent on the total cost of Dams Nos. 2 and 3 (see statement No. 3, pp. 8, 9), his gross annual cost of power would be as follows:

(1) 4 per cent interest on \$83,175,475.....	\$3,327,019
(2) Add operation charges (as per statement No. 3, on pp. 8, 9), \$3,622,246, less \$2,000,000 interest charges.....	1,622,246
(3) Add to complete the amortization of \$83,175,475, not included in item (2) above.....	32,686

Total annual cost for power..... 4,981,951

On the basis of the above annual cost of \$4,981,951 applying to an annual production of 3,083,500,000 kilowatt hours, the kilowatt hour cost becomes 1.62 mills.

For primary power used 8,000 hours yearly, Mr. Ford's annual cost would be..... \$14.83

For 60 per cent load factor (general commercial power) primary power, Mr. Ford's annual cost would be..... 9.75

For 24-hour secondary power, Mr. Ford's annual cost would be at the rate of..... 7.41

The total energy created of 3,083,500,000 kilowatt hours is equivalent to an average of 517,000 horsepower used 8,000 hours per annum; this 517,000 horsepower will cost Mr. Ford..... 9.64

All of the above costs per horsepower are at least 20 per cent lower than present costs for the same classes of power elsewhere in the South or at Keokuk or Niagara Falls.

NOTE.—The use of 8,000 hours annually is here assumed for primary power, because 8,000 hours is about the average annual use when deductions for normal shutdowns and repair requirements are allowed for.

The above plan of paying 4 per cent on total costs would fully amortize the total costs of Dams Nos. 2 and 3 at the end of the lease period, and would save the Treasury of the United States during the lease period \$1,275,000,000, equivalent to an average annual saving of over \$13,500,000.

The CHAIRMAN. Colonel, there is a great difference of opinion among honest-thinking men as to the use of the power of this project that the Government might develop, as to whether there ought to be any regulation or preference given between a commercial corporation or individual buying the power and a public utility concern. Do you get the idea?

Mr. COOPER. Yes.

The CHAIRMAN. What is your idea on this question of power developed from navigable streams?

Mr. COOPER. I think that the public-ownership idea ought to be given a preference until everybody admits that it is not worth anything.

The CHAIRMAN. I am not speaking of public ownership, particularly. For instance, here if we develop this water power down there, whether you would give it to a man like Mr. Ford, for instance, so that he could build a big factory, whatever he wanted, and use it as he pleases, or whether we ought to give first preference to cities and villages?

Mr. COOPER. I think I would give first preference to cities and villages. It will benefit in the end a lot more people.

The CHAIRMAN. The point is if we give it to an individual it will benefit him, help him, but unless we have some regulation of the output that he is going to sell to the consuming public, I don't know how the consumer is going to get anything out of it?

Mr. COOPER. My understanding is that there is very little power that enters into Mr. Ford's fertilizer plans anyway, because the Haber process (the pre-

ent best hope for nitrates) does not require much power. There will remain therefore a large amount of power that will go into a business that is not subject to regulation and this, I think, is wrong in principle. I am for regulation. I have been preaching regulation in Congress for 10 years, and am going to keep it up as long as I live. I believe that private capital is too selfish to be allowed to go unregulated. There are exceptions, but take it on the average they all need it.

The CHAIRMAN. I personally do not see anything wrong with the individual, if he should get this from the Government, manufacturing something or anything he pleases. He would get it as a financial venture and he would get all he could out of his project, and we could not find fault with him for doing it. All he would have to do, he would have to undersell the fellow that did not have such cheap power, and that is as far down as he would have to put his price.

Mr. COOPER. And he would stop right there.

The CHAIRMAN. The result would be that the public would not get but little benefit and he would get an immense benefit.

Mr. COOPER. Yes.

Senator NORBECK. When you get through I would like to ask one question. Maybe it is covered here already; and if so, it was before I came in. I understand you take the position that Ford would get really a bargain in this matter, the bargain consisting in part of a large property turned over to him for a very nominal consideration, but also in a credit extension on the part of the Government; in other words, the Government furnishing the money much cheaper than money could be secured in the open money market for this kind of an enterprise?

Mr. COOPER. Yes.

Senator NORBECK. After he gets this contract, if we give it to him according to his offer, what could he sell that on the market for? What could it be capitalized and sold at?

Mr. COOPER. I don't know. It would be a perfectly fabulous sum, because during the life of a hundred-year contract coal is going to cost four or maybe six times what it does now. It would be worth one hundred fifty to two hundred million dollars.

Senator NORBECK. You feel if we accept this proposal we will be giving him a gift of something like that?

Mr. COOPER. I should say that would be what you would do.

The CHAIRMAN. In other words, if we went into the contract according to his bid, and it was all signed up, he could turn right around and sell it?

Mr. COOPER. He could undoubtedly capitalize it for at least \$200,000,000.

The CHAIRMAN. And there is nothing in the contract that would prevent it?

Mr. COOPER. No.

Senator HEFLIN. But he agrees to bind himself to the Government to manufacture fertilizers?

Senator NORBECK. With part of the horsepower.

Mr. COOPER. With part of the horsepower. You see, the guaranty that is inferentially referred to in the \$10,000,000 that he proposed to put into fertilizer is a mere bagatelle as compared with the value of the franchise. He could afford to lose the whole fertilizer capitalization.

Senator HEFLIN. Did you state how many horsepower you thought could be produced there?

Mr. COOPER. From Dams 2 and 3 it amounts to an average of 517,000 horsepower per annum, based upon the present unregulated flow of the Tennessee River. Now, when the Tennessee is regulated—as it must be in the interest of the people of the South—that 517,000,000 horsepower will proportionately increase. The natural resource that exists there to-day is of tremendous potential value. If a man in the water-power business had come down here and proposed what Mr. Ford has proposed you would have killed him before he got through saying it.

Senator HEFLIN. Here is the situation we have, Colonel: We have a project down there, a dam across the river that is a block to navigation, making navigation impossible, and the Government has quit work on it. It was lying in that condition. Nobody seemed to want it. Nobody tried to get it for months and months and months. Mr. Ford made this offer, then other concerns put in offers, and still others commenced to fight Ford's offer, to keep him from getting it. Now, he is anxious to have it decided. He wants to get it now and go to work with it.

Mr. COOPER. Yes.

Senator HEFLIN. He wants the Government to go ahead and complete it, or let him complete it, so that he will know what he is going to do about it. If we should take your suggestion and postpone consideration for months and months—and you admit it would take nine months—

Mr. COOPER. That is the maximum. It might be six, and it would be time and money well spent.

Senator HEFLIN. He might withdraw his offer and some of the others might withdraw theirs, and then the whole thing would go up in smoke, and we might not have the dam completed there, and nothing would be done with it.

Mr. COOPER. That is inconceivable.

Senator HEFLIN. You would think it inconceivable that the Government would quit work on it, would you?

Mr. COOPER. Not at the time it did quit work.

On this question of the moral obligation to Mr. Ford because he made the first bid, have you had your attention called to the fact that when he made the first bid it was \$23,000,000 shy in the amount that the work was to cost?

Senator HEFLIN. That is, his payment?

Mr. COOPER. Yes.

Senator HEFLIN. He does not agree with you and others now as to what it would cost.

Mr. COOPER. In spite of his great knowledge about making Ford cars, he must have something to learn about the water-power business. I contend that I know more about it than Ford does.

Senator HEFLIN. He has done a great deal of constructive work. He claims if he had charge of it he could build that dam cheaper than you could, or cheaper than anyone else.

Mr. COOPER. If you get him before this committee, or if Mr. Mayo returns before this committee, ask him how he came out on his two water powers that he had the same wonder working idea about when he started, and what the final results showed.

Senator NORBECK. Who is going to make jitneys if Ford goes into the power business?

Senator HEFLIN. He might make jitneys down there.

You say he might make aluminum down there with some of this power. If he did, wouldn't that make competition for the Aluminum Trust and bring the price down?

Mr. COOPER. The Aluminum Trust, I think, has all the competition it needs just now and they seem to get along all right. What I am looking at is the value to the people of the country. Take Messina, N. Y. Have you ever been there?

Senator HEFLIN. No, sir.

Mr. COOPER. Messina, N. Y., has 175,000 horsepower devoted exclusively to aluminum, and the population of the town is not much greater than it was 20 years ago. The aluminum industry does not build up a country, and what the South needs is to have its country built up to make it highly prosperous.

Senator HEFLIN. Mr. Edison says Ford would build up that section industrially if he got this project.

Mr. COOPER. He would in a little circle, undoubtedly, right around Muscle Shoals, but what about the balance of the South?

Senator HEFLIN. That would be that much. Every little is a help, is it not?

Mr. COOPER. I think the South would very greatly regret the situation that would be created by the adoption of this Ford proposal.

Senator HEFLIN. If Mr. Ford should get this project down there and manufacture fertilizers cheaper for the farmer, you admit that that would be a great blessing to them. Now, then, suppose he should die, as has been suggested, in 10 or 15 years. Then what would become of the farmers' cheap price? Could he not stipulate in the instructions that he might leave that the products of that mill or factory should be sold at a certain price, or not to make more than a certain amount of money above the cost of production?

Mr. COOPER. I think that is a legal question that I would not know much about: but may I make one statement with respect to that, and that is this:

I call the committee's attention to the fact that all over this world to-day there are numbers of very brilliant men trying to solve the fertilizer problem: and once you give a very favored position to Mr. Ford, and thereby shut off the power of universal competition, you will be making a mistake. The

farmers will get their fertilizer through an open door a good deal quicker than they will through putting all the eggs in one basket, and that Mr. Ford's basket.

Senator HEFLIN. They have got them all in one basket now.

Mr. COOPER. I don't agree with you.

Senator HEFLIN. The farmer has nothing to say at all about the price of fertilizer. The Fertilizer Trust fixes the price of fertilizer. That is Ford's offer. Suppose he manufactures fertilizer on a large scale; don't you think that competition would tend to bring down the price of fertilizer?

Mr. COOPER. Ordinarily it ought to, if it went to that extent; but you can't manufacture fertilizer at Muscle Shoals and ship it any great distance. The freight rates eat it up.

Senator HEFLIN. Suppose it could serve Georgia, Alabama, Tennessee, and a few of those States around there; that would leave this other supply to go to the other sections and make fertilizer cheaper, and is not that worth considering in looking into these offers?

Mr. COOPER. If this committee of experts that I have recommended, after a thorough investigation, should say that was the right thing to do, I would say amen to it, but I don't know enough about it to have any fixed opinion about the fertilizer end of it.

Senator HEFLIN. But you don't like Mr. Ford's offer?

Mr. COOPER. I think it is a preposterous offer, and I am very sure that it will never be adopted by this Government. If it is, I shall want to leave the United States from sheer shame. I can not conceive of it being done.

Senator HEFLIN. You would rather see it just lie idle?

Mr. COOPER. Oh, no; I would not. I have too much reliance on the common sense of Congress. Everybody knows it ought to be finished. All you have to do is to find out what is the best way to do it; and the best way to go forward is, I think, along the lines I have recommended.

Senator HEFLIN. The farmers and organizations in the South and West have indorsed the Ford offer, and they say it is the only way that they can get the cheaper fertilizer, and they are very much interested in his offer being accepted.

Mr. COOPER. I don't think the farmer knows very much more about that sort of thing than engineers do about farming.

Senator HEFLIN. He is supposed to know more about his business than you know about his business, and you are supposed to know more about yours than he does.

Mr. COOPER. I am not pretending to know anything about it, so we are all right on that.

Senator HEFLIN. I think he knows more about his business than you or any other man does.

Mr. COOPER. I don't claim to know anything about fertilizer, therefore I want some expert advice.

Senator HEFLIN. Mr. Ford says he will not charge over 8 per cent above cost of production. That would be a wonderful thing to the farmers of the Nation. They suggest what would happen when he died. You remember Ben Franklin had it stipulated that the Saturday Evening Post should never sell for more than 5 cents, and it still sells for that.

Mr. COOPER. That was before my memory began to function.

Senator HEFLIN. He did it; he stipulated it should always sell for 5 cents, and it is selling for 5 cents now. Mr. Ford could stipulate in his will that whoever gets this property must sell the product at a certain price or a certain interest above the cost of production.

The CHAIRMAN. It ought to be in this contract. If that is going to be in Mr. Ford's will he ought to make his will and put it in the contract.

Mr. COOPER. I think so, too.

The CHAIRMAN. The trouble is that when he is dead, unless that is in his will, this corporation will be like any other corporation.

Mr. COOPER. Hit the rocks, and that is the end of it.

Senator HEFLIN. We might suggest that he put it in his contract that when he dies he will make some such provision.

The CHAIRMAN. Yes. There is not anything of that kind in the contract.

Senator HEFLIN. Not yet.

The CHAIRMAN. Is there anything else anyone wants to ask Colonel Cooper?

Senator HEFLIN. I would hate to see the colonel move out of the country; but I would be willing to take the Ford proposition for the benefit of the farmers of the United States in order to relieve them from the Fertilizer Trust and relieve

us from dependence on Chile for our nitrate supply in time of war. I would be willing to have the colonel go and come back every now and then and see us.

The CHAIRMAN. We are very much obliged to you.

Before we adjourn, I have a letter that I think the committee ought to know about, and I will put it in the record, not as a part of the colonel's testimony but at the conclusion of it.

(The chairman thereupon read the letter, as follows:)

WAR DEPARTMENT.

Washington, May 19, 1922.

DEAR MR. CHAIRMAN: I think I should inform you that I have an offer of \$2,500,000 for the Gorgas power plant, the interest which the Government has in the railroad near there, and the transmission line from the Gorgas plant to Muscle Shoals. You will doubtless wish to bring this to the attention of your committee.

Sincerely yours,

JOHN W. WEEKS, *Secretary of War.*

HON. GEORGE W. NORRIS,

Chairman Committee on Agriculture, United States Senate.

Senator HEFLIN. Does he state who offers it?

The CHAIRMAN. No; that is all he says.

The CHAIRMAN. Doctor Tolman wishes to make a further statement before the committee. We will hear you now, Doctor.

**FURTHER STATEMENT OF DR. RICHARD C. TOLMAN, DIRECTOR
FIXED NITROGEN RESEARCH LABORATORY, DEPARTMENT OF
AGRICULTURE, WASHINGTON, D. C.**

Doctor TOLMAN. After the testimony which I gave to the committee on May 19, the chairman of the committee asked me if I had not stated before the House Committee on Military Affairs that the Secretary of Agriculture was in favor of the Ford proposal in preference to a Government-owned corporation for the operation of the nitrate plants. I have discussed this matter with the Secretary, and wish to make the following statement:

The main interest of the Department of Agriculture in the nitrate plants is to secure their operation for the production of nitrogen for fertilizer purposes, and the department looks with favor upon any practical proposal which will insure the continuous operation of the plants for this purpose.

On February 14, 1922, the Secretary authorized me to make the following statement to the House Committee on Military Affairs:

"The Department of Agriculture believes that the farmers of the United States would be benefited by the operation of the Muscle Shoals plant to produce fixed nitrogen for use in fertilizers.

"The department understands that Congress has already decided against the operation of this plant by a Government-owned corporation, and that operation must be by a private individual or corporation.

"The department has collected a great deal of information as to the utilization of the plant and as to the possibilities for its future development, and stands ready to cooperate to the fullest extent possible with any agency which may secure the plant.

"Concerning the Ford proposal, if its terms are sufficiently definite and binding to make sure that the plant will be operated continuously for the manufacture of fertilizer, the department looks with favor upon its acceptance, believing that it will result in making available a considerably increased supply of fertilizer in time of peace and give us assurance of adequate supplies of explosives in case of need. The department does not undertake to pass upon the terms of the contract or venture an opinion as to whether they are sufficiently definite and enforceable to guarantee the continuous manufacture of fertilizer."

At the time the above statement was made the Ford proposal was the only one under consideration, and it was assumed that Congress, in failing to pass the Wadsworth bill, had definitely decided against the operation of the plants by a Government-owned corporation. Since then the situation has been modified by the presentation of other offers for the completion or operation of the properties in question, and also by the introduction of two bills, S. 3420 and S. 3585, for the creation of governmental or quasi governmental corporations for the operation of the nitrate plants.

It will be seen from the above that the Secretary's main interest in the nitrate plants has been to secure their continuous operation for the production of fertilizer material. The Secretary has not desired to pass upon the terms of the Ford or any other proposal and does not desire to do so.

In case the Committee on Agriculture and Forestry should decide in favor of a Government-owned corporation for the operation of the nitrate plants the Department of Agriculture would be very glad to offer suggestions as to the character of the corporation to be formed.

The CHAIRMAN. On behalf of the committee I ought to say to you, Doctor, I think, that as to these suggestions, the committee would be very glad to hear them, through the Secretary of anyone whom he wishes to send here to any of these meetings. It is proper that they should come in during the hearings, because those bills are before the committee, the same as these offers.

Doctor TOLMAN. The Secretary does not wish to be put in the position of sponsoring any such idea.

The CHAIRMAN. No; I understand that.

Doctor TOLMAN. But if the committee should request such suggestions he will be very glad to send them.

The CHAIRMAN. Well, I do not know that I would be authorized by the committee to make any particular suggestion as to what he should do, but in that statement you conclude there with a paragraph which says you would be glad to make any suggestions. Now, there are two such bills pending before this committee. They are officially before this committee now, and we would be glad to have criticisms or suggestions or changes, not only in regard to every proposition that is here but in regard to every bill that is here, and we would be glad to have suggestions as to what the bill should be, if it is not here. This is open to the world and we would be very glad to have the Secretary either come in person or send whatever representative he wants to send, to make the suggestions he said he would be glad to make.

Doctor TOLMAN. I would be very glad to speak to the Secretary about the matter, Mr. Chairman.

The CHAIRMAN. Yes; I wish you would communicate with him.

We will now hear Mr. Downing.

STATEMENT OF MR. P. M. DOWNING, VICE PRESIDENT PACIFIC GAS & ELECTRIC CO., SAN FRANCISCO, CALIF.

Mr. DOWNING. Mr. Chairman, P. M. Downing is my name. I am vice president of the Pacific Gas & Electric Co., of San Francisco, Calif.

I do not know just what testimony I might be able to give to the committee here that would be of interest to it. It has been suggested, however, that the committee might possibly be interested in knowing what has been accomplished there in connection with the development of the water powers of that State by private capital. I am familiar in a general way with the situation in the South, having spent a few days at Muscle Shoals going over the situation there during September of last year, and I know that the situation in the South is comparable with that in our State. I would not attempt to go too far into the detail of the situation at Muscle Shoals, but having been intimately associated with the development of water powers in California for the past 20 years, I will be glad, if the committee is interested in knowing something of what has been accomplished there under private ownership and public control, to outline very briefly what has been done there.

The CHAIRMAN. I think the committee would be very glad to hear anything you have to say along that line, Mr. Downing.

Mr. DOWNING. We have in our State no developed water powers that are not devoted to public use. All are under the control of and operated by public utilities, either publicly or privately owned. California has done more than any other States in the way of developing its water powers. In hydroelectric output it ranks first. It is second only to New York in the amount of hydroelectric power installed. It has also done more in the way of interconnecting the various power developments than any other State. As a matter of fact, the systems of all of the power companies, whether water or steam, from the southern part of Oregon on the north to the Mexican line on the south, are connected into a common network of transmission lines. In this way we take advantage of the diversity of stream flows throughout the entire length of the State and also the diversity of load, and thereby obtain economies of operation not otherwise possible.

As a result of this interconnection of transmission lines and other facilities, it has been possible to develop rural communities and to give a much more nearly universal service than would otherwise be possible. Our agricultural load is a very important part of the total. Our rates, too, are between 20 to 40 per cent lower than they are here in the East. This widespread distribution of service benefits the maximum number of people and the per capita consumption of power in California is greater than the average per capita consumption anywhere else in the country. To be exact, the per capita consumption in California is between two and two and one-half times as great as it is in any other State, and as I said a moment ago, I consider this the result of the unification of operation of all these various plants. There is not a single instance in the State where hydroelectric power is being used for private purposes. It is all devoted to the service of the public.

The CHAIRMAN. You mean by that operation of street car lines, the lighting of municipalities, streets, and houses, etc.?

Mr. DOWNING. Yes.

The CHAIRMAN. Is it sold directly to municipalities?

Mr. DOWNING. In some instances the power companies wholesale power to municipalities. In other instances the power companies distribute themselves directly to the individual consumers.

The CHAIRMAN. Has the Hetch Hetchy project been developed?

Mr. DOWNING. The Hetch Hetchy project is being developed at the present time.

The CHAIRMAN. There is no water power yet there that can be utilized?

Mr. DOWNING. No; the city and county of San Francisco only recently placed an order for the electrical equipment to go in the Hetch Hetchy project.

The CHAIRMAN. Has the dam been completed in the Hetch Hetchy Valley?

Mr. DOWNING. It is under construction at the present time.

The CHAIRMAN. When will it be completed?

Mr. DOWNING. It will probably be another year before the Hetch Hetchy Dam is completed.

The CHAIRMAN. Where is the water power in that system going to be developed, or is it going to be developed in several places?

Mr. DOWNING. There is one small development operating at the present time on the Hetch Hetchy project. That, however, is more or less of a temporary installation, made for the purpose of supplying power for the construction purposes. They have built one dam already and are using the water impounded behind that dam for the operation of this temporary plant.

The CHAIRMAN. Is there any water impounded at Hetch Hetchy itself?

Mr. DOWNING. No.

The CHAIRMAN. Not yet?

Mr. DOWNING. No. The water to be stored in Hetch Hetchy will be temporarily carried down a natural watercourse a distance approximately 12 miles, where it will be diverted into a tunnel approximately 18 miles in length to the first permanent power installation. After passing through this plant it is proposed to carry it on to San Francisco, where it will be used for domestic purposes.

The CHAIRMAN. How many power installations will there be in that project when it is all completed?

Mr. DOWNING. There have been a number of proposals—I think the present plan contemplates perhaps five or six all told.

The CHAIRMAN. That is owned by the county and city of San Francisco, is it?

Mr. DOWNING. That is owned by the city and county of San Francisco, yes.

The CHAIRMAN. As I remember it was contemplated that they would develop, in addition to getting water, 100,000 horsepower; is that about right?

Mr. DOWNING. That is about right; yes, Mr. Chairman. Their first installation, for which equipment is in order at the present time, will have an installation capacity of 50,000 kilowatts.

The CHAIRMAN. That electricity will be carried mainly, I presume, to San Francisco?

Mr. DOWNING. That is the plan.

The CHAIRMAN. And outlying suburbs?

Mr. DOWNING. That is the plan at the present time, although nothing has been done in the way of acquiring distributing systems in San Francisco or elsewhere, nor has anything been done in the way of providing a transmission line from their power house to the city of San Francisco.

The CHAIRMAN. Do the laws of California give any preference as between the private individual or corporation and the public utility, in the use of power that is developed on the streams there?

Mr. DOWNING. No; it does not. As a matter of fact, with the exception of that of the city of Los Angeles, I do not recall any municipally owned water-power projects in operation at the present time.

The CHAIRMAN. No; I do not mean that. I mean if you, as a private individual, had under the laws secured the right to build a dam and you had constructed one and had a lot of electricity for sale, could you, under the law, sell that all to me for the purpose of manufacturing automobiles, for instance, or something of that kind, if there was a municipality or a railroad or something of that kind that wanted it?

Mr. DOWNING. I do not know that there is any distinction. As a matter of fact there has always been an adequate supply of power for privately owned and operated industries, as well as municipalities, so the question has never been raised.

The CHAIRMAN. Has there been any power development in the Los Angeles water aqueduct proposition?

Mr. DOWNING. There has; yes.

The CHAIRMAN. Are you familiar with that?

Mr. DOWNING. In a general way I am. Los Angeles has developed some power, the greater part of which, I understand, is now being sold through the Southern California Edison Co.

The CHAIRMAN. That is part of the water system of Los Angeles the same as Hetch Hetchy is a part of the water system of San Francisco, is it not?

Mr. DOWNING. Yes, sir; it is a part of their municipal water supply.

The CHAIRMAN. Yes. Well, the entire thing is not municipally owned, is it?

Mr. DOWNING. They have had an agreement with the Southern California Edison Co., which contemplates the city taking over at least a portion of the distributing system in the city of Los Angeles, owned by the Southern California Edison Co.

The CHAIRMAN. Well, the Southern California Edison Co. simply owns the distributing lines in the city of Los Angeles. Is not that the situation?

Mr. DOWNING. Yes. It also owns and operates a large number of water and steam power plants and distributes over a very large area outside of the city of Los Angeles.

The CHAIRMAN. The city of Los Angeles, however, develops its own power?

Mr. DOWNING. Yes.

The CHAIRMAN. And it is going to utilize that company and supply them with electricity and use their existing distributing system, as I understand it?

Mr. DOWNING. The city expects to eventually supply the consumers directly rather than through the privately owned Southern California Edison Co.

The CHAIRMAN. Yes.

Mr. DOWNING. Heretofore they have done that only indirectly by supplying power to the Southern California Edison Co., which company, in turn, has sold it to the users.

The CHAIRMAN. This private corporation, the Southern California Edison Co., now owns and did own the distributing system in the city of Los Angeles; is not that the fact?

Mr. DOWNING. Yes. There is an arrangement, however, whereby—

The CHAIRMAN. Now, they are going to get their electricity in turn from a development that is handled by the city itself?

Mr. DOWNING. A small part of it only.

The CHAIRMAN. Yes.

Mr. DOWNING. A small part of it.

The CHAIRMAN. When that system is completed, how much electricity will be developed there, do you know?

Mr. DOWNING. By the city of Los Angeles?

The CHAIRMAN. Yes. I mean connected with the water supply?

Mr. DOWNING. I can not give you that exact figure; no. My understanding is that there is something around 80,000 or 90,000 horsepower at the present time.

The CHAIRMAN. They have the water now in the city?

Mr. DOWNING. Oh, yes.

The CHAIRMAN. That is completed?

Mr. DOWNING. Yes.

The CHAIRMAN. Have they not installed their power units?

Mr. DOWNING. They have, I think, two, or perhaps three, different plants, having an aggregate capacity of 80,000 horsepower. That is an approximate figure.

The CHAIRMAN. Do you know what it is going to cost?

Mr. DOWNING. No; I do not.

The CHAIRMAN. Have you made an estimate of what it is going to cost San Francisco in the Hetch Hetchy project?

Mr. DOWNING. I do not know that we have. It is very hard to allocate what proportion of the capital charge should be made to water and what should be made to electric power.

The CHAIRMAN. That is the same in both instances?

Mr. DOWNING. That is the same in both instances; yes.

The CHAIRMAN. Yes. Of course, that question is involved in each case.

Mr. DOWNING. Yes.

The CHAIRMAN. How did you happen to be examining Muscle Shoals, Mr. Downing?

Mr. DOWNING. I went there at the request of Secretary Hoover.

The CHAIRMAN. In whose interest?

Mr. DOWNING. At the request of Secretary Hoover, for the interest of no one, except the Government.

The CHAIRMAN. Well, how did Secretary Hoover happen to be interested on the part of the Government in Muscle Shoals?

Mr. DOWNING. I do not know.

The CHAIRMAN. Do you know that?

Mr. DOWNING. No; I do not.

The CHAIRMAN. Were you paid for making the investigation?

Mr. DOWNING. No, sir.

The CHAIRMAN. Well, are you not entitled to pay? Are you not going to get pay for it?

Mr. DOWNING. I did not ask for any pay at all. I received not a cent from anyone for making the investigation.

The CHAIRMAN. You came from California to do that?

Mr. DOWNING. Yes, sir.

The CHAIRMAN. At his request?

Mr. DOWNING. Yes, sir.

The CHAIRMAN. Well, do you know what Secretary Hoover expected to do about it?

Mr. DOWNING. No, sir.

The CHAIRMAN. Did he not give you any information as to what he wanted to know?

Mr. DOWNING. No.

The CHAIRMAN. Or why he wanted to make this investigation?

Mr. DOWNING. No; he asked me to go to Muscle Shoals, visualize the situation there, and then come on to Washington and discuss the matter with him, which I did.

Senator HEFLIN. When was that?

Mr. DOWNING. That was in either the latter part of August or the early part of September of last year.

The CHAIRMAN. Well, is Secretary Hoover interested in any way in this development down there?

Mr. DOWNING. Not that I know of.

The CHAIRMAN. You understood that his interest was as a Government official, did you?

Mr. DOWNING. Yes.

The CHAIRMAN. You made your report to him, did you?

Mr. DOWNING. Yes, sir.

The CHAIRMAN. What was the nature of your report?

Mr. DOWNING. I outlined to him the situation as I saw it in the very short time that I spent there.

The CHAIRMAN. In brief, what were your conclusions that you reported to Secretary Hoover?

Mr. DOWNING. I told him that there was a splendid opportunity there for power development, but that I thought it should not be developed as a private enterprise but under public regulation; and that the power should be used in connection with the other powers in the South in order that a maximum public beneficial use might be made of it.

The CHAIRMAN. In other words, it should be hooked up with the other systems there the same as you have hooked them up in California?

Mr. DOWNING. Absolutely; yes, sir.

The CHAIRMAN. That it would become part of the network that is now composed of the Alabama Power Co. and the two or three other corporations over toward North Carolina.

Mr. DOWNING. In other words, I reached the conclusion after spending several days on the ground that the public generally would receive a maximum benefit by devoting the plant to the general service of the public rather than to turn it over to an individual industry in that immediate vicinity.

The CHAIRMAN. Did you make any investigation about the nitrate plants there?

Mr. DOWNING. No, sir.

The CHAIRMAN. Did Secretary Hoover express any interest in the nitrate proposition?

Mr. DOWNING. No.

The CHAIRMAN. Did he ask you to investigate that thing?

Mr. DOWNING. No; I am not familiar with the production of nitrates.

The CHAIRMAN. You did not know, even, how much of that power it would take to operate the nitrate plant?

Mr. DOWNING. No, sir.

The CHAIRMAN. Did Secretary Hoover make any inquiry about that?

Mr. DOWNING. No.

Senator HEFLIN. You went down there shortly after Mr. Ford made his offer, did you?

Mr. DOWNING. Yes, sir.

The CHAIRMAN. Well, did you make a report on the Ford offer?

Mr. DOWNING. I discussed it with Secretary Hoover; yes.

The CHAIRMAN. Was that a part of your mission down there?

Mr. DOWNING. Yes.

The CHAIRMAN. Now, what in a general way, was your report to Secretary Hoover on the Ford offer?

Mr. DOWNING. I told him I thought it would be a mistake to accept the Ford offer in the form it was in at that time.

The CHAIRMAN. Well, did Secretary Hoover ask you to report that to the Secretary of War, who had charge of the proposition?

Mr. DOWNING. Yes; I discussed it with the Secretary of War also.

The CHAIRMAN. Mr. Hoover sent you to the Secretary of War?

Mr. DOWNING. Yes, sir.

The CHAIRMAN. And you expressed the same opinion to him?

Mr. DOWNING. Yes, sir.

The CHAIRMAN. Did the Secretary of War have anything to do with having you go down there to examine it?

Mr. DOWNING. No, sir.

The CHAIRMAN. That was all Mr. Hoover's suggestion?

Mr. DOWNING. Yes, sir; all at Mr. Hoover's request.

Senator HEFLIN. Who paid your expenses, Mr. Downing?

Mr. DOWNING. The Pacific Gas and Electric Co., by whom I am employed.

The CHAIRMAN. Did they happen to be interested in Muscle Shoals, or why did they go to that expense?

Mr. DOWNING. The Pacific Gas and Electric Co.?

The CHAIRMAN. Yes.

Mr. DOWNING. They have no interest whatever in Muscle Shoals; absolutely none.

The CHAIRMAN. Yet they paid your expenses down there?

Mr. DOWNING. Yes, sir.

The CHAIRMAN. What is their business? What is the business of the Pacific Gas & Electric Co.?

Mr. DOWNING. The Pacific Gas & Electric Co. is engaged in the business of selling electricity, gas, water, and the operation of street railways.

The CHAIRMAN. In California?

Mr. DOWNING. In California.

The CHAIRMAN. Is Mr. Hoover interested in any way in that company?

Mr. DOWNING. Not that I know of. I do not know that he owns a share of stock in it or has any other interest in it whatever.

The CHAIRMAN. What official position do you hold in that company?

Mr. DOWNING. Vice president.

The CHAIRMAN. Vice president?

Mr. DOWNING. Yes, sir.

The CHAIRMAN. Did you talk the matter over with the other officials of the company before you went down, before you made that investigation?

Mr. DOWNING. Yes.

The CHAIRMAN. Did you, or did the Pacific Gas & Electric Co. expect to have any interest in the Muscle Shoals development?

Mr. DOWNING. No, sir; none whatever.

The CHAIRMAN. The only reason you went down there was because Secretary Hoover asked you to?

Mr. DOWNING. Yes, sir.

The CHAIRMAN. Now, why should that company, then, pay your expenses across the continent because Secretary Hoover asked you to go and make this investigation?

Mr. DOWNING. They were perfectly agreeable that I should go.

The CHAIRMAN. In supplying gas and electricity to the public, under your public utilities commission of California the expenses of all of the officers of your company, such, for instance, as your expense in making a trip to Muscle Shoals, would be charged up as a part of the expenses of the company and would be included in the rates to the public so that the company would make a sufficient return over and above all of those expenses, would they not?

Mr. DOWNING. I presume that it would go in as an operating expense; yes.

The CHAIRMAN. Well, do you think that is an operating expense? Do you think that is a proper charge to assess against the operating expenses of your company in the supplying of electricity and gas to the public, and whose rates are regulated by the public utilities commission? Do you think that commission would allow that as an expense, if it was called to their attention?

Mr. DOWNING. I do not know. The amount involved is negligible and I do not think that the railroad commission of our State would question the propriety of such an expenditure when same was necessary in carrying out the request of a Cabinet officer. Speaking for the company I represent, we feel that when such a request is made it is our patriotic duty to comply with it.

The CHAIRMAN. Yes; probably no one would know it was there. The amount would be small, but if that was a proper charge, then there would not be any limit. You could go around the world and the other officials of the company could go around the other way, and those expenses would be charged up, and you could make the people who buy your gas and electricity pay those expenses.

Mr. DOWNING. We probably would not go that far, Mr. Chairman. I think a question might be raised if we got into an amount of that size.

The CHAIRMAN. Have you any further questions, Senator Heflin?

Senator HEFLIN. I believe you said you reported unfavorably on the Ford offer?

Mr. DOWNING. I stated that in my opinion the Ford offer should not be accepted.

Senator HEFLIN. Mr. Ford has now modified his offer since then, has he not?

Mr. DOWNING. I understand so.

Senator HEFLIN. He now agrees to use a good deal of this power down there for the manufacture of fertilizer, and he agrees that he will charge only 8 per cent above the cost of production as profit. Do you not think, if the Government would let him have it to use in the manufacture of fertilizers on a large scale, that that would be a great blessing to the farmers of the country?

Mr. DOWNING. I do not know just what the 8 per cent means. Fertilizer at cost does not always mean cheap fertilizer.

Senator HEFLIN. Well, you heard Colonel Cooper's testimony about how cheap that power would be if Mr. Ford got it under the terms of his offer?

Mr. DOWNING. Yes.

Senator HEFLIN. And Mr. Edison said that there is no doubt that cheap fertilizers could be produced there. Would not that be of great benefit to the farmers of the United States, and are they not worthy of consideration in letting out this project down there? Ought not this project to be let out. Mr. Downing, to somebody who will use it for the benefit of the greatest number of people in the United States?

Mr. DOWNING. Oh, I think, as against the Government operating it, perhaps that would be a desirable arrangement; yes. However, in my opinion it ought

to be put in the hands of somebody who would make the maximum use of it for the benefit of the greatest number of people.

Senator HEFLIN. Well, there are a great many farmers in the United States—several millions of them, and if they could be benefited by getting cheap fertilizers, that would probably be serving more people than it could be used for in any other way?

Mr. DOWNING. I do not know just how that would work out.

Senator HEFLIN. Is there any understanding between your companies out there and the companies of other sections? Have you any agreement about prices or anything of that kind?

Mr. DOWNING. Absolutely none. We are entirely under the control, both with respect to service and rates, of the State regulatory body.

Senator HEFLIN. And you say you serve people out there at a cheaper horsepower rate for your power than any other State? Was that your statement?

Mr. DOWNING. Yes, sir.

Senator HEFLIN. What was your statement about that—about its being 20 per cent cheaper than in any other State?

Mr. DOWNING. The power rates in California—not of the particular company that I happen to represent—are 20 to 40 per cent lower than those here in the East.

Senator HEFLIN. What is the overage price per kilowatt hour in your State?

Mr. DOWNING. I can not give you that figure. The average price received by the particular company that I represent, for the year 1921, was 2.1 cents per kilowatt hour.

The CHAIRMAN. Now, what did the consumer pay for that same electricity, do you know?

Mr. DOWNING. That is what the consumer paid to us.

The CHAIRMAN. All right. I do not believe you quite understand my question, because, if you do, that is a remarkably low price. Do you mean, for instance, that the person in a private residence in San Francisco pays 2.1 cents?

Mr. DOWNING. No, sir; that is the average rate, Senator. Do not get confused on that.

The CHAIRMAN. That is what I am trying to find out. What does the real consumer in the house pay for electricity in San Francisco?

Mr. DOWNING. The top rate, as I recall, at the present time, is 8 cents per kilowatt hour, plus a surcharge fixed by the railroad commission of 6 per cent. That is the top rate for a certain amount of power used by the individual household consumer.

The CHAIRMAN. Now, how does that compute, the 6 per cent feature, that you say is a surcharge? How much does it amount to when a man has to pay it? Suppose I lived there now instead of in Washington. How much would I have to pay per kilowatt hour in my residence for electricity?

Mr. DOWNING. For the first block of 30 to 50 kilowatt hours per month—I have not the exact figures here.

The CHAIRMAN. All right.

Mr. DOWNING. For that first block you would pay 8 cents per kilowatt hour, plus 6 per cent on the 8 cents, or 8.48 cents.

The CHAIRMAN. Yes.

Mr. DOWNING. For the next block of approximately 70 kilowatt hours for the month, the rate would be 6 cents per kilowatt hour, plus the 6 per cent surcharge. The rate becomes less with increased usage, the lowest rate being 3 cents per kilowatt hour. It should be understood that these are residential lighting rates only. Commercial lighting rates for office buildings, industrial plants, etc., are considerably lower than residential rates and power rates are even lower still.

The CHAIRMAN. Yes.

Mr. DOWNING. Now, let me make myself clear on that 2.1 cent rate. This is the average rate received for all power sold. Commercial power, of course, sells at a very much less rate than that.

The CHAIRMAN. Yes.

Mr. DOWNING. So that, taking the average rate for all power sold we receive 2.1 cents per kilowatt hour.

The CHAIRMAN. Oh, yes. It is not important that it be exact. It is interesting, however. Suppose this same householder that was paying 8 cents per kilo-

watt hour, plus the 6 per cent surcharge, had a stove, a cooking stove, would he get a less rate on that?

Mr. DOWNING. He would get a lower rate for that.

The CHAIRMAN. He gets a lower rate for that?

Mr. DOWNING. Yes; it takes a different classification.

The CHAIRMAN. Does he have to have two meters?

Mr. DOWNING. No; a single meter. He gets a lower rate in this way. We estimate the amount of power that will be required for lighting purposes, and any used in excess of that amount takes a lower rate.

The CHAIRMAN. Yes.

Mr. DOWNING. On the theory that the higher rate will apply for lighting and the lower rate will carry all of the energy used for cooking or heating.

The CHAIRMAN. That is, if you wanted to use some for operating a washing machine, that would take the lower rate?

Mr. DOWNING. That would take the lower rate; yes.

Senator HEFLIN. What is the average price for lighting purposes per kilowatt hour?

The CHAIRMAN. Senator, he has given us that.

Senator HEFLIN. Has he?

The CHAIRMAN. Yes.

Mr. DOWNING. That is for residential purposes.

The CHAIRMAN. Yes. That is 8 cents per kilowatt hour plus 6 per cent surcharge.

Mr. DOWNING. When it comes to lighting office buildings—commercial lighting, if you please—the rate is considerably lower than 8 cents. For instance, in some of the congested business centers in San Francisco the top rate will go down to $3\frac{1}{2}$ or 4 cents, perhaps.

Senator HEFLIN. Then, the 8 cents was about the average price for that purpose?

Mr. DOWNING. That is about the average price.

Senator HEFLIN. For lighting purposes?

Mr. DOWNING. For ordinary residence use; yes.

The CHAIRMAN. You get your electricity from this net work, or your part of this net work, do you?

Mr. DOWNING. We have 28 different water-power plants feeding into this net work, and four steam plants. We purchase power from eight other companies engaged in similar business.

The CHAIRMAN. I guess that is all, Mr. Downing.

Mr. DOWNING. I would like to add that that company that I happen to be connected with is the third largest in the United States in electrical output, the only two having a greater output being the Commonwealth Edison Co. of Chicago and the Niagara Falls Power Co.

The CHAIRMAN. Have you any further statement you wish to make?

Mr. DOWNING. I would like to say that the favorable condition in our State has been brought about largely, if not entirely, by the fact that there has been this interconnection of facilities.

The CHAIRMAN. I think it is conceded that that is a great economy. When one branch of the system is crowded, they borrow from another branch which does not happen to be crowded at the same time.

Mr. DOWNING. We have never attempted to estimate the saving which ultimately results to the consumer by this net work, but in order that you might have some intimation of the economies that can be effected by a general interconnection of that kind, there was made here in the East, within the last year or two, a survey to determine how much of a saving could be made by a general interconnection of lines and systems, in exactly the same way as has been done in California. This saving, as I recall, amounted to something over \$239,000,000 per year or approximately \$750,000 per day.

The CHAIRMAN. Yes; I remember seeing that, and it is very important. In the development of water powers the most economical use of them, I think it is conceded, at least that we know of now, is to have them all connected, but I suppose the danger in that is monopoly. That is always true, however. A monopoly that is economical has to be guarded against so that it is not abused.

Mr. DOWNING. We, in California, do not regard it as a monopoly, because we are under such complete regulation by the State—

The CHAIRMAN. Yes.

Mr. DOWNING (continuing). We feel that under public regulation it is impossible for monopolies, in the sense that we ordinarily think of them to exist.

The CHAIRMAN. Your regulatory body there is the railroad commission, is it not?

Mr. DOWNING. The railroad commission of the State; yes.

The CHAIRMAN. That commission, in addition to railroad regulation, has charge of the hydroelectric power companies, does it not?

Mr. DOWNING. Their authority goes to the control of all privately owned utility companies, and by "utility companies" I mean those supplying gas, electricity, steam, water, street railways, etc.

The CHAIRMAN. They have power to fix the rate after a hearing, absolutely?

Mr. DOWNING. Yes; absolutely.

The CHAIRMAN. If you were charging some community or some individual a rate and that rate were complained of, you would have a hearing before this commission?

Mr. DOWNING. The consumer has a hearing.

The CHAIRMAN. And then they fix the rate after hearing?

Mr. DOWNING. The supplying company is cited to appear and the railroad commission fixes the rate.

The CHAIRMAN. Yes.

Mr. DOWNING. I might say that the State regulatory body does not have control over municipally owned utilities. A municipality owning its own lighting system or its own water system is not under the control of the State regulatory body, the State railroad commission?

The CHAIRMAN. No.

Senator HEFLIN. Yet they have some authority in the city to regulate that?

Mr. DOWNING. No.

The CHAIRMAN. Not in the city, Senator.

Senator HEFLIN. I say the city has some authority.

The CHAIRMAN. Oh, yes. Well, the city owns it absolutely.

Senator HEFLIN. Yes. The people are there and have an opportunity to elect somebody to see that the proper charges are made?

The CHAIRMAN. Oh, yes.

Mr. DOWNING. But the railroad commission has absolute control over privately owned utilities supplying in cities?

Senator HEFLIN. Yes.

Mr. DOWNING. Not only in so far as the physical service is concerned but also with respect to the rates, the issuance of securities, the disposition of any property, etc.?

Senator HEFLIN. But what I meant was that if the city owned the plant, then the city government would regulate the price.

Mr. DOWNING. Yes.

The CHAIRMAN. They have authority to examine the books of these private companies and to see that they are not charging up expenses that are wrong, have they not?

Mr. DOWNING. The privately owned utilities are required to keep their accounts in the manner prescribed by the railroad commission.

The CHAIRMAN. Now, if they find that they are charging something that ought not to be charged against the cost they have jurisdiction to rectify the mistake, have they not?

Mr. DOWNING. Absolutely; yes. In other words, every privately owned utility must keep its books and accounts not as they themselves want to but as the State railroad commission says they must keep them.

The CHAIRMAN. Exactly. Now, if this State railroad commission in your case should find that, at the request of Mr. Hoover, you had spent several hundred dollars, and they had charged those expenses up, and if the commission had thought it was wrong for you to come down here to Muscle Shoals for this purpose, they could compel the company of which you were an officer to eradicate that charge?

Mr. DOWNING. Oh, I presume they could; yes. They have a right to throw out any charge that they think is not proper to go in as a charge against operation.

The CHAIRMAN. All right. We are much obliged to you, Mr. Downing.

That is the last witness for to-day, so we will adjourn here until to-morrow morning at 10.30 o'clock.

(Whereupon, at 12.30 o'clock p. m., the committee adjourned until to-morrow, Tuesday, May 23, 1922, at 10.30 o'clock a. m.)

MUSCLE SHOALS.

TUESDAY, MAY 23, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris (chairman), presiding.

Present: Senators Norris (chairman), Capper, Ladd, Ransdell, and Heflin.

The CHAIRMAN. The committee will come to order.

STATEMENT OF MR. FRANCIS L. HAWES, SPECIAL AGENT FEDERAL TRADE COMMISSION.

The CHAIRMAN. Will you give your name?

MR. HAWES. Francis L. Hawes, special agent of the Federal Trade Commission.

The CHAIRMAN. How long have you been with the Federal Trade Commission?

MR. HAWES. Eighteen years. That is, I was with the Federal Trade Commission and the old Bureau of Corporations.

The CHAIRMAN. You started in when the Bureau of Corporations was formed?

MR. HAWES. Shortly afterwards.

The CHAIRMAN. And have been with them ever since?

MR. HAWES. Yes, sir.

The CHAIRMAN. When the Federal Trade Commission was organized you were part of the bureau that went over to them?

MR. HAWES. Yes, sir.

The CHAIRMAN. What has been your work since you have been with them?

MR. HAWES. Largely investigation work, field work in connection with various investigations.

The CHAIRMAN. Have you made an investigation of the fertilizer industry?

MR. HAWES. I took part in the fertilizer investigation in 1914 and 1915.

The CHAIRMAN. Has the Federal Trade Commission made any investigation since that date?

MR. HAWES. No extended investigation since that date.

The CHAIRMAN. I know, but I think I had better ask you, for the record, you do not know anything about Muscle Shoals?

MR. HAWES. No, sir.

The CHAIRMAN. You do not know anything about the cyanamid process or the Haber process for extracting nitrogen from the air?

MR. HAWES. Only just as I have read some articles on the subject.

The CHAIRMAN. Do you know anything about the plants at Alabama near Muscle Shoals?

MR. HAWES. No, sir.

The CHAIRMAN. The purpose of sending for you, Mr. Hawes, was to have you tell us something about the fertilizer industry. It has constantly been creeping out here, and I thought it would be well to have some one who had made an unbiased investigation tell us the result of it, just what you found.

Senator HEFLIN. I believe, Mr. Chairman, somebody testified that there were seven big concerns that practically controlled the price.

The CHAIRMAN. I presume this witness will know all about that. I have not talked with him about it, but the investigation closed when?

MR. HAWES. I should say about the latter part of 1915.

The CHAIRMAN. It went up to conditions during the war?

Mr. HAWES. During the early part of the war. The statistical part of this report ends July 1, 1914.

The CHAIRMAN. That was about the beginning of the war?

Mr. HAWES. Yes.

The CHAIRMAN. Go ahead in your own way and tell us all about the fertilizer industry. Is there a combination, and if so, what is it; and if there is not, tell us that; and is there any combination existing now, or has there been, that raised the price to the farmer more than it ought to have been?

Mr. HAWES. At the time of the date of this report supply and demand was what controlled the price of fertilizers and fertilizer materials, with the exception of potash. There was no combination and had not been since 1904 or 1905. At that time there was a close combination through a Canadian corporation, and that was broken up effectually in 1905 and 1906. Since that date, as far as the rest of the producers of fertilizers and fertilizer materials are concerned, there has been no combination, up to the issuance of this report.

The CHAIRMAN. Do you know anything about it since that date?

Mr. HAWES. No.

The CHAIRMAN. Has there been any complaint to the commission since then?

Mr. HAWES. There have been one or two complaints regarding the prices of nitrate of soda.

The CHAIRMAN. And they were investigated by the commission?

Mr. HAWES. Only so far as investigating so far as field work was concerned.

The CHAIRMAN. What did the investigation show? Was there merit to the complaint or not?

Mr. HAWES. There was no merit to it.

The CHAIRMAN. You say that there was no combination in the fertilizer field and that the fertilizer ingredients prices were controlled by supply and demand, excepting as to potash. Tell us how that was controlled.

Mr. HAWES. The potash was controlled by the German potash syndicate, which is a government monopoly.

The CHAIRMAN. In Germany?

Mr. HAWES. In Germany. Not only did it control the price but it controlled the output; did not allow new mines to be opened up.

The CHAIRMAN. How did that control the American market?

Mr. HAWES. It only controlled the American market, inasmuch as there was no competition in buying potash abroad. The price here was fixed; that is, the minimum price was fixed by the price in Germany.

The CHAIRMAN. There was no domestic supply?

Mr. HAWES. There was no domestic supply.

The CHAIRMAN. Did not the war break that up; not only did it break it up, but it shut off the entire supply from Germany, did it not?

Mr. HAWES. It shut off the entire supply.

The CHAIRMAN. What happened then?

Mr. HAWES. Well, we have opened up some sources of supply in this country—in the Nebraska lakes at Searles Lake, some from the kelp industry, and some from the cement industry. The total production from domestic sources, I think, only amounts to about 4,000 tons a year of K_2O .

The CHAIRMAN. That is not enough to supply the demand for fertilizer, is it?

Mr. HAWES. I should say from 10 to 20 per cent.

The CHAIRMAN. Where did they get the balance of it; or didn't they get it?

Mr. HAWES. They did not have it during the war.

The CHAIRMAN. So that would cause the shortage of the fertilizer. Well, we didn't have the nitrogen, either, did we, during the war?

Mr. HAWES. Well, we had plenty of nitrogen.

The CHAIRMAN. Yes; I believe we did.

Mr. HAWES. From the various sources—cottonseed meal, nitrate of soda, and sulphate of ammonia.

The CHAIRMAN. Most of it came from Chile, did it not?

Mr. HAWES. A large part of it came from Chile.

The CHAIRMAN. Of course, we were never shut off there during the war, although it was expensive to get it.

Mr. HAWES. The price went up. It more than doubled.

The CHAIRMAN. One reason for that high cost of Chilean nitrate was the export duty, was it not?

Mr. HAWES. The export duty.

The CHAIRMAN. Put on by the Chilean Government?

Mr. HAWES. Put on by the Chilean Government, which I understand amounted to about \$10 a ton, and is the largest source of revenue for the Chilean Government.

The CHAIRMAN. Are those American concerns still operated that you said started up during the war?

Mr. HAWES. I really do not know whether they are or not.

The CHAIRMAN. Take the Nebraska lakes, for instance, were they able to supply potash at a price that would compete with the German product when they got an opportunity to come in?

Mr. HAWES. Senator, I really know nothing about the cost of production of potash at the Nebraska lakes or Searles Lake. The price was several times the pre-war price of potash. If I remember rightly the war-time price of potash reached \$2.50 per unit, compared to 70 cents per unit prior to that.

The CHAIRMAN. Do you know what has happened to the foreign supply from Germany and now from France? A good deal of it is from Alsace-Lorraine, is it not?

Mr. HAWES. Yes, sir.

The CHAIRMAN. Do you know what has happened to that supply?

Mr. HAWES. Why, no.

The CHAIRMAN. Are there any questions from any members of the committee?

Senator HEFLIN. What steps have you taken to prevent the control of prices by the Fertilizer Trust?

Mr. HAWES. You mean they control the price of manufactured fertilizer?

Senator HEFLIN. Yes, sir.

Mr. HAWES. No steps have been taken?

Senator HEFLIN. No specific case has been presented?

Mr. HAWES. No complaint has been made to the commission so far as I know. No charge has been made that there is a combination.

Senator HEFLIN. What did you say?

Mr. HAWES. No charge has been made that there is a combination among the fertilizer people.

The CHAIRMAN. If I understand your testimony here, if I get it right now, up to the war, in July, 1914, the investigation of the Federal Trade Commission shows that there was no such thing as a Fertilizer Trust.

Mr. HAWES. Yes, sir.

The CHAIRMAN. And that the price was controlled by supply and demand?

Mr. HAWES. By supply and demand.

The CHAIRMAN. There were no indications of an artificial control?

Mr. HAWES. None whatever, except, as I said, in the case of potash.

Senator HEFLIN. Mr. Chairman, I don't recall the name of the gentleman who testified before us the other day, but my recollection of his testimony is that he stated there were certain big companies that controlled the price.

The CHAIRMAN. Maybe this witness will know something about that.

Mr. HAWES. There are several large companies which control 40 to 50 per cent of the output of manufactured fertilizer.

Senator HEFLIN. If I remember his testimony he said they controlled 60 per cent.

Mr. HAWES. Forty-four companies controlled about 68 per cent. That is set out fully in this report of the Federal Trade Commission.

Senator CAPPER. Are there about as many companies now engaged in the fertilizer business as there were when that report was made?

Mr. HAWES. I don't think there are. I think that probably—as just an estimate, I should say 200 concerns less to-day than there were at the time this report was made.

The CHAIRMAN. Now, what caused that decrease?

Mr. HAWES. The inability of the small dry mixers to secure materials during the war.

Senator HEFLIN. A good deal of it happened by the big concerns buying them out, putting them under control?

Mr. HAWES. I could say that that really took place. I don't believe it did.

Senator HEFLIN. But you really have not investigated it in seven years?

Mr. HAWES. We have not investigated it in seven years. I do know that they have taken over some additional plants. For instance, the Virginia Agricultural Chemical Co., took over a large plant in Indiana when it was completed.

Senator HEFLIN. Then that would be counted under the head of big concerns?

Mr. HAWES. Yes, sir.

Senator HEFLIN. It would disappear as an independent concern?

Mr. HAWES. Yes, sir.

Senator HEFLIN. So that accounts for a good many of these concerns disappearing or appearing to be out of business, I suppose.

Mr. HAWES. Of course these small concerns that disappeared were what we term "dry mixers"; they had no machinery to speak of; a place just to mix the materials together and put them in a bag, etc. Their influence was entirely local.

Senator HEFLIN. They do no manufacture; they just mix?

Mr. HAWES. They just mix. There are two classes, or rather three classes of manufacturers—the wet mixers, the dry mixers, and the wet mixers are also those who own their own chambers for manufacturing.

The CHAIRMAN. The fertilizer business is, to a great extent, a mixing business anyway, is it not?

Mr. HAWES. Largely so.

The CHAIRMAN. They get nitrogen and potash and phosphorus and mix them?

Mr. HAWES. Yes.

The CHAIRMAN. Now, some of the companies, as I understand it, manufacture their own phosphorus?

Mr. HAWES. Oh, yes; yes, indeed; many of them.

The CHAIRMAN. Are there any of them that manufacture their own nitrates or supply themselves from property that they own with their potash?

Mr. HAWES. Well, there are some that manufacture the nitrates in that they convert material which contains nitrogen in an unavailable form into an available form; they take any old animal matter, such as leather, feathers, derby hats, and things of that sort, and they make nitrogen of that. I don't know whether this is in point here at this time, but there were great quantities of animal materials available for fertilizer purposes in the past. At the present time those materials go largely into animal feeds.

Senator LADD. What are some of those products?

Mr. HAWES. Packing-house tankage.

Senator LADD. How much of the potash was imported a year at that time?

Mr. HAWES. I can give you the imports here out of a table I have. I think it ran up as high as a million tons.

Senator LADD. It ran up, you say, around a million tons, while we produce only 40,000 or 50,000 tons?

Mr. HAWES. That million tons was the gross.

Senator LADD. The gross?

Mr. HAWES. Yes. It probably did not contain over 400,000 tons of actual potash.

Senator LADD. How much Chilean saltpeter was imported?

Mr. HAWES. We used to import somewhere in the neighborhood of 600,000 tons. I can give you the exact figures.

Senator LADD. What proportion of the total nitrogen content of the fertilizer is made up of the Chilean saltpeter?

Mr. HAWES. I have got those figures right here. Now, what is your question?

Senator LADD. The question I asked was, "What percentage of the total amount of nitrogen is in the form of Chilean saltpeter?"

Mr. HAWES. In the year 1913, 18 per cent.

Senator LADD. What amount was in the form of blood and like materials—tankage, etc.?

Mr. HAWES. Nitrate of soda about 30 per cent, sulphate of ammonia about 20 per cent, high-grade tankage about 15 per cent, cotton-seed meal about 30 per cent, and the balance was made up of cyanamid, concentrated tankage, dried blood, and dried fish scrap.

The CHAIRMAN. Did you, representing the commission, make any investigation as to the domestic supplies of potash in Utah?

Mr. HAWES. No. No one went out there to look at it.

The CHAIRMAN. You don't know anything about the beds out there?

Mr. HAWES. The development of that proposition took place just after the investigation was closed, and whatever information we have was secured through the Armour Fertilizer Works.

The CHAIRMAN. Are the Armour Fertilizer Works interested in the Utah proposition?

Mr. HAWES. They are, at Maryville.

The CHAIRMAN. That is about 200 miles from Salt Lake City?

Mr. HAWES. Yes, sir.

The CHAIRMAN. Is that the company that Mr. Hanson is president of?

Mr. HAWES. I really could not say.

The CHAIRMAN. Do you know, or did you come in contact with Mr. Hanson in the fertilizer investigation?

Mr. HAWES. No.

The CHAIRMAN. That has developed since you made your investigation?

Mr. HAWES. That has developed since we made our investigation.

The CHAIRMAN. Do you know anything about it except what the ordinary person would gather from the newspapers in regard to the possibilities of potash production there?

Mr. HAWES. No; I do not.

Senator LADD. What per cent of the total fertilizers did you say were made by the larger firms—40 per cent, was it?

Mr. HAWES. I estimate about 40 per cent.

Senator HEFLIN. Did you name those concerns?

Mr. HAWES. No, sir.

Senator HEFLIN. Can you name them?

Mr. HAWES. Yes, sir.

Senator HEFLIN. I wish you would.

Mr. HAWES. The Virginia-Carolina Chemical Co., the American Agricultural Chemical Co., the Armour Fertilizer Works, the International Agricultural Corporation, F. S. Royster, Swift & Co., and Baugh & Co.

Senator HEFLIN. They are the big seven?

Mr. HAWES. They are the big seven.

Senator HEFLIN. There has been a good deal said in the newspapers about the Fertilizer Trust, and we have received letters about the trust, that they control the price of fertilizers, and are fighting the Ford offer. Mr. Ford, as you know, has made an offer to get Muscle Shoals?

Mr. HAWES. Yes.

Senator HEFLIN. We have just been wondering how we could get at these trusts and prevent them from holding up the farmers and charging any price they please for fertilizers.

Mr. HAWES. Of course, the farmer has a remedy in buying his materials and doing his own mixing.

Senator HEFLIN. Can he get his materials from somebody other than companies that are controlled by the big concerns?

Mr. HAWES. The Nitrate Agencies Co., of New York, has been making a specialty, or were at one time, of furnishing materials to the farmers.

Senator HEFLIN. But will they sell it much cheaper to the farmer than the big concerns?

Mr. HAWES. They did at that time.

Senator HEFLIN. That was seven years ago?

Mr. HAWES. Seven years ago.

Senator HEFLIN. You don't know what sort of methods they have employed since and are employing now to control the price?

Mr. HAWES. No.

Senator HEFLIN. That is all I care to ask, Mr. Chairman.

The CHAIRMAN. Senator Hefflin, if you can suggest any witnesses about this fertilizer proposition, tending to show that there is a Fertilizer Trust, or anything of that kind, I should be glad to send for them.

Senator HEFLIN. There seems to be a question involved here whether there is really a control of the price to the farmers, and I would like to go into it. I think it has a bearing on this question.

The CHAIRMAN. I have sent for everybody that I have thought of and put them on the stand here.

Senator HEFLIN. I thought it was universally accepted that there is a Fertilizer Trust. I never heard anybody express a doubt about it.

The CHAIRMAN. I rather accepted it in my own mind at the beginning of this hearing, but I knew nothing about it. Of course, I do not come in contact with the fertilizer question like you do.

Senator HEFLIN. Our witness does not testify that there is no such thing as a trust now. He said, at the time they investigated it, seven years ago, there was not.

The CHAIRMAN. Oh, no; but if there is such a thing we ought to be able to find it.

Senator HEFLIN. I would like to get some witnesses on the subject.

The CHAIRMAN. If you will give me the names, I will send for them. We did have one man here—of course, he would have been prejudiced somewhat—but if there is a trust, the head of the trust was on the stand right here the other day. I had him come from Chicago here. I have asked everybody to come that I could think of. I think that witness answered very frankly all the questions I asked him that would have a tendency to show a combination, although I knew nothing about it. The fertilizer question is something that in my State we never talk about. The only thing that happened was during the war they commenced to get potash out of those lakes and I came in contact with them. They wanted a tariff on it, which I would not agree to.

Senator HEFLIN. We have had two witnesses already who represent the farming organizations—Mr. Bower and Mr. Silver—who both testified that there was a Fertilizer Trust and that it controlled the price.

The CHAIRMAN. Well, their testimony was hardly direct on that proposition.

If there are no further questions, we will adjourn until 10.30 to-morrow morning.

(Whereupon, at 11.15 o'clock a. m., the committee adjourned until to-morrow, Wednesday, May 24, 1922, at 10.30 o'clock a. m.)

MUSCLE SHOALS.

THURSDAY, JUNE 1, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met at 10.30 o'clock a. m., pursuant to call, in room 224, Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris, Keyes, Ladd, McKinley, Smith, Kendrick, and Harrison.

STATEMENT OF HON. JOHN W. WEEKS, SECRETARY OF WAR.

The CHAIRMAN. Mr. Secretary, you know what we are considering. We will be glad to have you go on in your own way and give us your views and the result of whatever investigation you have made with regard to Muscle Shoals.

Mr. WEEKS. Don't you think, Mr. Chairman, that you had better direct the particular line of inquiry that you would like to have me discuss? This is a pretty comprehensive subject and I might wander away from the matters in which you are particularly interested.

The CHAIRMAN. We will do that if you desire it.

Mr. WEEKS. I would very much prefer to have such questions asked as the committee wish to have me comment on, and I think we will save time by that method.

The CHAIRMAN. Mr. Secretary, have you investigated the various bids that have been made?

Mr. WEEKS. I have investigated two of them with a great deal of care.

The CHAIRMAN. What two?

Mr. WEEKS. The bid made by Mr. Ford and the bid made by the Alabama Power Co. The other bids came in and had not been passed on by the department when I was ready to send the original proposition made by Mr. Ford, or the final proposition, to Congress. I thought it my duty to send those bids up here, but I did it without any comment, because the engineers and others connected with the department had not given them careful study. I refer to the Engstrom bid and the Parsons bid.

The CHAIRMAN. We will take the two bids that you have investigated. Will you give us your idea with regard to them in whatever order you desire?

Mr. WEEKS. Well, the first one is Mr. Ford's bid.

I suppose the committee understands that I had no power in this matter. I was simply delegated to receive propositions and transmit them to Congress. It seemed to me, however, that it was my duty to try to develop a bid that might be given serious and perhaps affirmative consideration. I could not ask for public bids under the conditions that obtained, and after I announced early in my incumbency in the War Department that I would consider bids and send them to Congress, an attempt was made to develop satisfactory bids. The first one that came in was Mr. Ford's. That was sometime in July of last summer. I did not consider that Mr. Ford's original bid was a satisfactory one. Of course, there is a great deal of sentiment connected with his name and accomplishments. People in that vicinity, and in the South very generally, have the feeling that there are not only going to be developed methods of producing fertilizers at a lower ultimate cost to the consumer than has obtained heretofore, but that there will be a great industry developed at that point. As an

Senator HEFLIN. I would like to get some witnesses on the subject.

The CHAIRMAN. If you will give me the names, I will send for them. We did have one man here—of course, he would have been prejudiced somewhat—but if there is a trust, the head of the trust was on the stand right here the other day. I had him come from Chicago here. I have asked everybody to come that I could think of. I think that witness answered very frankly all the questions I asked him that would have a tendency to show a combination, although I knew nothing about it. The fertilizer question is something that in my State we never talk about. The only thing that happened was during the war they commenced to get potash out of those lakes and I came in contact with them. They wanted a tariff on it, which I would not agree to.

Senator HEFLIN. We have had two witnesses already who represent the farming organizations—Mr. Bower and Mr. Silver—who both testified that there was a Fertilizer Trust and that it controlled the price.

The CHAIRMAN. Well, their testimony was hardly direct on that proposition.

If there are no further questions, we will adjourn until 10.30 to-morrow morning.

(Whereupon, at 11.15 o'clock a. m., the committee adjourned until to-morrow, Wednesday, May 24, 1922, at 10.30 o'clock a. m.)

needed for any other purpose than for the purpose which Mr. Ford intends to put this plant to. I doubt if there is a market at this time in that general neighborhood for the power that would be developed by both dams. In any case, if I had it to do myself and were entirely responsible for it, I should develop Dam No. 2 and find out whether there was an additional market requirement before constructing Dam No. 3. That dam will cost \$20,000,000 at least—probably more. Nobody knows just exactly how much it will cost. That is not true of Dam No. 2. The cost of Dam No. 2 can be pretty closely estimated. But there have not been sufficient soundings and borings taken at the location of Dam No. 3 so that, in my opinion, anybody knows what it will cost. This doubt relates to the kind of foundation in that neighborhood, which may be very substantial and solid, and it may be just the reverse. You may have discovered, on your visit down there at Hales Bar, a development some years ago, where it was the belief that \$3,000,000 would make the development, but I am told that something like \$11,000,000 were required. So that, I think, the fact is that in the case of Dam No. 3 nobody knows just what it will cost, and it was that doubt which led over a series of negotiations to Mr. Ford reducing the rate of interest which he would pay on the amount of money which Mr. Ford would put in, from 6 per cent to 4 per cent, he believing, and his engineers believing, that \$40,000,000 would construct and equip both dams, and that 4 per cent of that would be substantially the sum of the ultimate interest that he had agreed to pay on the \$28,000,000 in his original proposition.

Then there is this feature about it which I think may well be taken into consideration. The title to this property remains in the Government. That being the case, there will be no taxes, and I think that if that is going to be developed as a commercial operation the communities there are entitled to the taxes on that investment.

There is no provision in the Ford offer to put the sales of power which he may make—he has not said, neither have his representatives, that he was going to sell power, but they have said that he might—there is no provision that the price of that power shall come under the direction of the Alabama Public Service Commission. My judgment is that it would automatically come under the jurisdiction of that commission. If the power was sold by anyone, it is my judgment that it would have to be done under prices regulated by the Alabama Public Service Commission. That should be done, of course, in any case. That is about the general opinion that I have of the Ford offer.

The Alabama Power Co. offer is quite—

The CHAIRMAN. Before you take that up, Mr. Secretary, let us ask you some questions about the Ford offer.

Mr. WEEKS. All right.

The CHAIRMAN. The Ford offer includes the turning over in fee to Mr. Ford the interest of the Government in the Gorgas plant and also the transmission line from the Gorgas plant over to Muscle Shoals?

Mr. WEEKS. Yes.

The CHAIRMAN. Did you give that any consideration?

Mr. WEEKS. Yes.

The CHAIRMAN. Have you or have your advisers reached any conclusion as to the difficulties that might arise in the settlement of any disputes that might come about if we attempted to convey that property to Mr. Ford or his corporation?

Mr. WEEKS. There quite likely would be a legal controversy over that. I don't know whether there would or not. There were contracts made, you know, with the Alabama Power Co., the Air Nitrates Co., and the Cyanamid Co. relative to various matters there. The Judge Advocate General of the Army and the Attorney General have said that the Air Nitrates contract is not sound, is not binding. That, of course, I can not controvert, and I am not sure about it. In the case of the Alabama Power Co., it owns the land on which the transmission line is located; it has an interest in the railroad in the neighborhood, and it now has a lease of the Gorgas plant. I have transmitted to you an offer from the Alabama Power Co. for the Government's interest in the railroad, the Gorgas plant, and the transmission line which was built by the Government of \$2,500,000.

The CHAIRMAN. Have you been down there, Mr. Secretary?

Mr. WEEKS. I have; yes.

The CHAIRMAN. You are familiar, then, with the way in which the property of the United States and the property of the Alabama Power Co. are intermingled?

Mr. WEEKS. Yes.

The CHAIRMAN. Have you investigated to determine whether there would be any difficulty, legal or otherwise, if the Government should take its interest in that property and dispose of it?

Mr. WEEKS. Well, I think the Alabama Power Co., which is under the Public Service Commission of Alabama, would be inclined to take a broad and generous view of any matter in which the Government might be involved. Their record seems to indicate that. They turned over property at Muscle Shoals to the Government at the beginning of the war which had cost something like \$500,000, and so far as I have been able to observe I do not think they would be contentious about those matters.

The CHAIRMAN. Even if they were not you are aware, I presume, that the houses, the residences of employees there, quite a large number, were built by the Government on Alabama Power Co. land; that the adjoining lot would be built on by the Alabama Power Co.; that there are other buildings there in which there is machinery owned in common by the two on land owned by the Alabama Power Co., and that the main building itself, the main steam plant, is on Alabama Power Co. land, part of it constructed by the Alabama Power Co. and part by the Government of the United States?

Mr. WEEKS. The interests are interwoven to a considerable extent. There is no doubt about that. If anybody is going to buy that particular property the Alabama Power Co. is the natural purchaser. It can use it to better advantage than anyone else. Moreover, I want to say that I do not see, while Mr. Ford has said that his offer must be taken in entirety and not in part, how that particular property is involved in the developments which Mr. Ford has in view. It is simply a question of furnishing additional power, but there will be immeasurably more power from the dams than will be required at Muscle Shoals, unless there is a very great industrial development there.

The CHAIRMAN. Well, what have you, if anything, to say, Mr. Secretary, in regard to the hundred-year proposition that is included in Mr. Ford's offer?

Mr. WEEKS. I am personally opposed to giving anyone power over a development of that kind for a hundred years. The Government has established a 50-year limitation in the water power act, which I think is quite enough. Nobody knows what is going to be developed in 50 years. A hundred years is a long time, and I have contended against that part of Mr. Ford's proposition from the start, that it was unwise for the Government to enter into an agreement of that kind, and especially with a provision which gives substantially an option to Mr. Ford to renew the contract, or for his successors to do so.

The CHAIRMAN. I would like to ask you a question or two that pertains to the Government entirely, and particularly to the War Department. We have been going on the theory here that it is absolutely necessary for the Government to keep that large plant in readiness as a war measure until at least such time as scientific men have developed a cheaper and better method of extracting nitrogen from the air. You are closer to the War Department, of course, than any of us, and we would like to know what, as head of the War Department, you think about the advisability of keeping intact the great plant there known as nitrate plant No. 2.

Mr. WEEKS. I think it is desirable for the immediate future, at least, that that be done. I believe there are going to be great developments in the fixation of nitrogen, and that within a reasonable time there will be plants or operations in many sections of the country that will be prepared to furnish nitrates by that process or by some other process; but for the present it is desirable, from the Government's standpoint, that that plant be kept in condition. That is one advantage of Mr. Ford's offer, and in fact all these offers provide that the plant shall be turned back to the Government, of course, if the Government needs it for its purposes, and Mr. Ford's offer provides that it shall be kept in condition to be turned back ready for operation at any time. I am not so clear in my mind about the other offers as to that one point.

The CHAIRMAN. At the end of the hundred-year period the title to plant No. 2 as well as all that other property outside of the dams and land adjacent thereto, belongs to the Ford corporation without any lien or without any restriction whatever?

Mr. WEEKS. Yes, sir; I think so.

The CHAIRMAN. In fact he gets fee simple title to all that property under his offer at once, with the only provision that he must keep the nitrate plant operative.

Mr. WEEKS. The Government may take it over in case of necessity.

The CHAIRMAN. Of course the Government could do that anyway.

Mr. WEEKS. I am personally not disturbed about the nitrate situation. We have a very considerable amount of nitrates on hand. The amount is being reduced somewhat, but an ample supply for any need that we can see at present, because the War Department has a great amount of powder and ammunition on hand, and I am thoroughly convinced that before the War Department is going to require any considerable amount of nitrates for ammunition purposes we are going to have an ample supply available in the United States.

The CHAIRMAN. In case of war with some foreign power or combination of powers which had a reasonably large navy would it not be difficult for us to keep ourselves supplied if we were cut off from the Chilean nitrate beds?

Mr. WEEKS. As I have just said, if we had war now we have powder or ammunition enough on hand to fight a very considerable war. It is an embarrassment to us to know what to do with it. Some of it is being disposed of.

The CHAIRMAN. It would not last long in case we had a million men in the field, would it?

Mr. WEEKS. We have on hand something less than 200,000 tons of nitrates, and we can produce nitrates for war purposes at that plant. It would cost a little more, but it could be done with that steam plant. I think the Government's position, with that plant available, is entirely beyond criticism.

The CHAIRMAN. It is your idea, then, that we ought to take no step that would interfere with that plant or that would get it out of condition?

Mr. WEEKS. I think it should for the present be kept available, so that the Government may use it if it needs to.

Senator KENDRICK. It is your opinion, Mr. Secretary, of course, that it would be more readily available if it were put into operation in the manufacture of nitrates under conditions that would give the Government control of it in case of war?

Mr. WEEKS. It will be ready to use at once.

Senator KENDRICK. More readily available if it were running?

Mr. WEEKS. Undoubtedly.

Senator KENDRICK. Would you favor the plan to go ahead and finish Dam No. 2?

Mr. WEEKS. If there were none of these offers pending?

Senator KENDRICK. Yes.

Mr. WEEKS. Yes; I would complete Dam No. 2.

Senator KENDRICK. Without regard to any outside proposition?

Mr. WEEKS. Without regard to any outside proposition. I believe it can be completed without taking a dollar out of the Treasury and that there is a sufficient market, or will be in the early future, for the power that will be developed there to enable the selling of bonds in sufficient amount to finish the construction of Dam No. 2.

Senator KENDRICK. If the other conditions in Mr. Ford's offer were met, have you given any thought as to the relative amount that he is paying and would, in your judgment, his offer be a satisfactory offer for the property?

Mr. WEEKS. I don't know as I quite follow you, Senator.

Senator KENDRICK. Supposing that the conditions which you have outlined as to time of the lease, the guaranty of the manufacture of fertilizer, and other objections to his present offer which you have raised were met, would you then consider his offer of \$5,000,000 for the Government's property a satisfactory offer?

Mr. WEEKS. I don't think \$5,000,000 is a satisfactory offer for the Government property.

I will say definitely, Mr. Chairman, that if the fertilizer phase of Mr. Ford's offer were left out. If that were discarded and there was not the certainty that he was going to manufacture fertilizer and an assurance that it would be done at a cost that would enable the ultimate consumer to get fertilizer cheaper than heretofore, I do not consider Mr. Ford's offer a satisfactory one; and, therefore, if I had the power I should insist that that phase of his offer should be made beyond any question.

Senator SMITH. The fertilizer phase of the offer, you mean?

Mr. WEEKS. Yes.

Senator MCKINLEY. Mr. Secretary, you made the statement that you think Mr. Ford, if he was manufacturing power there, would be under the control, as to price, of the Alabama Power Commission.

Mr. WEEKS. Yes.

The CHAIRMAN. Have you investigated to determine whether there would be any difficulty, legal or otherwise, if the Government should take its interest in that property and dispose of it?

Mr. WEEKS. Well, I think the Alabama Power Co., which is under the Public Service Commission of Alabama, would be inclined to take a broad and generous view of any matter in which the Government might be involved. Their record seems to indicate that. They turned over property at Muscle Shoals to the Government at the beginning of the war which had cost something like \$500,000, and so far as I have been able to observe I do not think they would be contentious about those matters.

The CHAIRMAN. Even if they were not you are aware, I presume, that the houses, the residences of employees there, quite a large number, were built by the Government on Alabama Power Co. land; that the adjoining lot would be built on by the Alabama Power Co.; that there are other buildings there in which there is machinery owned in common by the two on land owned by the Alabama Power Co., and that the main building itself, the main steam plant, is on Alabama Power Co. land, part of it constructed by the Alabama Power Co. and part by the Government of the United States?

Mr. WEEKS. The interests are interwoven to a considerable extent. There is no doubt about that. If anybody is going to buy that particular property the Alabama Power Co. is the natural purchaser. It can use it to better advantage than anyone else. Moreover, I want to say that I do not see, while Mr. Ford has said that his offer must be taken in entirety and not in part, how that particular property is involved in the developments which Mr. Ford has in view. It is simply a question of furnishing additional power, but there will be immeasurably more power from the dams than will be required at Muscle Shoals unless there is a very great industrial development there.

The CHAIRMAN. Well, what have you, if anything, to say, Mr. Secretary, in regard to the hundred-year proposition that is included in Mr. Ford's offer?

Mr. WEEKS. I am personally opposed to giving anyone power over a development of that kind for a hundred years. The Government has established a 50-year limitation in the water power act, which I think is quite enough. Nobody knows what is going to be developed in 50 years. A hundred years is a long time, and I have contended against that part of Mr. Ford's proposition from the start, that it was unwise for the Government to enter into an agreement of that kind, and especially with a provision which gives substantially an option to Mr. Ford to renew the contract, or for his successors to do so.

Senator KENDRICK. More readily available if it were running?

Mr. WEEKS. Undoubtedly.

Senator KENDRICK. Would you favor the plan to go ahead and finish Dam No. 2?

Mr. WEEKS. If there were none of these offers pending?

Senator KENDRICK. Yes.

Mr. WEEKS. Yes; I would complete Dam No. 2.

Senator KENDRICK. Without regard to any outside proposition?

Mr. WEEKS. Without regard to any outside proposition. I believe it can be completed without taking a dollar out of the Treasury and that there is a sufficient market, or will be in the early future, for the power that will be developed there to enable the selling of bonds in sufficient amount to finish the construction of Dam No. 2.

Senator KENDRICK. If the other conditions in Mr. Ford's offer were met, have you given any thought as to the relative amount that he is paying and would, in your judgment, his offer be a satisfactory offer for the property?

Mr. WEEKS. I don't know as I quite follow you, Senator.

Senator KENDRICK. Supposing that the conditions which you have outlined as to time of the lease, the guaranty of the manufacture of fertilizer, and other objections to his present offer which you have raised were met, would you then consider his offer of \$5,000,000 for the Government's property a satisfactory offer?

Mr. WEEKS. I don't think \$5,000,000 is a satisfactory offer for the Government property.

I will say definitely, Mr. Chairman, that if the fertilizer phase of Mr. Ford's offer were left out, if that were discarded and there was not the certainty that he was going to manufacture fertilizer and an assurance that it would be done at a cost that would enable the ultimate consumer to get fertilizer cheaper than heretofore, I do not consider Mr. Ford's offer a satisfactory one; and, therefore, if I had the power I should insist that that phase of his offer should be made beyond any question.

Senator SMITH. The fertilizer phase of the offer, you mean?

Mr. WEEKS. Yes.

Senator MCKINLEY. Mr. Secretary, you made the statement that you think Mr. Ford, if he was manufacturing power there, would be under the control, as to price, of the Alabama Power Commission.

Mr. WEEKS. The Alabama Public Service Commission.

Senator MCKINLEY. Yes. I am rather under the impression—possibly there has been no decision, but I think the legal advice has been that selling power by a corporation of that kind to another one, they are not under that control.

Mr. WEEKS. I have raised that question several times, and you would know more about that than I would, Senator. It seems to me that no harm could be done to put into the agreement that any power sold should be sold under conditions imposed by the Alabama Public Service Commission. I have been assured that undoubtedly the laws of Alabama, the property being located in that State, would apply to it if sales were made, and that the commission would automatically have control over those sales.

The CHAIRMAN. I have had the understanding all the time, although there is nothing in Mr. Ford's offer to show it, but from the testimony of his representatives and general statements, that he does not intend to sell this power. If he did not sell it and this corporation utilized it in whatever business they might engage directly without any sale, then, of course, the Alabama Power Commission would have no jurisdiction whatever over it.

Mr. WEEKS. I have been told by Mr. Ford's representatives that it was not his purpose to sell power, and I assume that it is not his purpose now; but Mr. Mayo, as I recall it, did say that he might sell power for a time.

The CHAIRMAN. Yes; until they got their manufacturing operations started. I think that was the idea.

Senator KENDRICK. Is there not a chance for a conflict between the Alabama commission and the Federal authority on that question of selling power that actually belongs to the Government?

Mr. WEEKS. I doubt that.

Senator HARRISON. In New York there, in the development and sale of power from Niagara Falls, the Public Service Commission of New York has regulated the price. If the Alabama law is at fault, I think they could change it.

Mr. WEEKS. Yes. However, it would not do any great harm to put that into an agreement, if one were to be made, to insure its being done.

The CHAIRMAN. Are there any further questions now, before the Secretary leaves the Ford offer and takes up the next one? All right, Mr. Secretary, take up the Alabama Power Co. offer.

Mr. WEEKS. The Alabama Power Co. offer is of an entirely different character. I have hesitated about other offers, considering them favorably, which did not include the fertilizer feature directly and in the same manner that Mr. Ford's does, not that I have any assurance that Mr. Ford can manufacture fertilizers cheaper than others, and in fact there may be reasons to doubt it, but in any case that is a question in which the public is greatly interested, and if the Government is to charge off, must charge off a very large expenditure, its justification for doing so could be that it did involve a great public interest. Therefore, as I have said, I think there should be an absolute certainty about the manufacture of fertilizer. The Alabama Power Co. does not involve the Government in any additional expenditures whatever except to pay the cost of locks which will be necessary to get around Dam No. 2. That will not be over, I think, \$2,500,000. It offers, as you know, to turn over to the Government or anyone designated by the Government to use it, 100,000 secondary horsepower. That secondary feature is one that ought to be considered by the committee. The Tennessee River is very irregular in its flow. There are periods when in all probability not over a hundred thousand horsepower, and perhaps less than a hundred thousand primary power will be developed by Dam No. 2—probably less; but for nine months of the year, relatively speaking, there will be developed very greatly increased power, and that is the power that the Alabama Power Co. proposes, if their offer is accepted, to turn over to the Government. It might last longer than nine months, and maybe somewhat less—perhaps 10 months or 8 months—but I think a fair estimate of it would be three-quarters of the year.

Senator SMITH. Mr. Secretary, what do the engineers estimate is the minimum primary horsepower that will be developed at No. 2?

Mr. WEEKS. I have seen 80,000 estimated horsepower, I think, as the lowest possible.

Senator MCKINLEY. Our testimony here is that it is 87,000.

The CHAIRMAN. Eighty-seven thousand three hundred is the primary power.

Senator SMITH. The maximum secondary power—that is, the flood water power—is what?

Mr. WEEKS. I do not carry those figures in my mind, Senator.

Senator MCKINLEY. Mr. Ford requires them to put in 650,000 horsepower machinery.

The CHAIRMAN. There may be times in the year that it will exceed that, Senator. The testimony shows that, I think, without any contradiction.

Senator SMITH. I have not had the figures given to me, but I have understood that there are times when the guaranteed or primary horsepower would be down as low as 80,000.

The CHAIRMAN. Yes.

Mr. WEEKS. You ought to keep in mind that that additional power which is developed, 650,000 horsepower, will not all be secondary; a very considerable part of it will not be available more than six months in the year, I think, but the engineers' figures would be more accurate than my recollection.

Senator MCKINLEY. It is all in the testimony?

Mr. WEEKS. Yes; it is all in the testimony.

As a representative of the Government, trying to close up war contracts and war operations and liquidate as much as possible all the property which the Government does not need, leaving out the question of fertilizers altogether, the Alabama Power Co.'s offer would lead me to think that that was the better one for the Government to accept, if it were considering its own necessities, because it does not require additional appropriation, substantially speaking, and it does develop what that section will need—perhaps needs now—additional power—which I think the Government should have in view to help any community where it can do so in its disposition of such matters, and it would prevent the possible differences which may develop in settling the mutual relationships which, to some degree, exist between the Alabama Power Co. and the Government. I think those properties outside of the dams can be liquidated for very much more than Mr. Ford's offer without any particular trouble. While plant No. 1 has been a failure and has been considered of little value, I am not sure that the process can not be developed there which will make that plant a valuable property.

Senator KENDRICK. Right there, Mr. Secretary, I would like to ask you a question:

Is it not true, with the development of that power at dam No. 2, all of those splendidly constructed buildings will be valuable assets in themselves as manufacturing plants of one kind or another?

Mr. WEEKS. Yes.

Senator KENDRICK. If the Government chose to sell them for such purposes?

Mr. WEEKS. They will have material value, without any doubt, and I might add this: The committee may have noticed the large number of houses which are located at No. 1 plant and No. 2 plant. They are excellent houses. Their market value, to sell them under present conditions, is not very great, but if that power were developed, they would be a valuable asset, and I should have this in mind—have had it in mind—in saying if I had the power I would complete that dam. If that power is developed, it will mean that these houses will probably sell for possibly two or three or four times as much as they can be sold for to-day, and there is a large number of them.

Senator KENDRICK. In one locality I recall an entire addition built up of beautiful cottages, well constructed.

Mr. WEEKS. Yes; in two localities.

Senator KENDRICK. Well, I only saw one.

Mr. WEEKS. One at plant No. 2 and one at plant No. 1.

The CHAIRMAN. Has the War Department, or have you now, so that you can give it to us, the number of houses—residences, I am speaking of now—that the Government owns down there at Muscle Shoals?

Mr. WEEKS. Do you know, Major Burns?

Major BURNS. They own about 125,000 at United States nitrate plant No. 1 and about 100,000 at United States nitrate plant No. 2.

The CHAIRMAN. How many permanent homes?

Major BURNS. That is, construction camps; no permanent houses to speak of.

The CHAIRMAN. There are some there.

Major BURNS. There may have been a few permanent houses, but practically all of these are construction camps.

The CHAIRMAN. Outside of those houses at nitrate plant No. 2, there are a lot of other houses that are not permanent?

Major BURNS. Yes, sir.

The CHAIRMAN. Just temporary buildings—construction camps, as you call them. They have a vast amount of lumber in them.

Major BURNS. They have. They had, perhaps, about 20,000 down there during the construction period.

Senator KENDRICK. In addition to enormous development in the way of sewerage, I should say, and grading, and other work necessary in preparation for a community.

Mr. WEEKS. That is where the money went.

Senator KENDRICK. That must be, from appearances, rather permanent in its character.

Mr. WEEKS. Much of it is.

Senator MCKINLEY. Mr. Secretary, do I understand—is this the Alabama Power Co. offer, in a way: The United States Government keeps the nitrate plants; the Alabama Power Co. takes the dam as it stands and completes the dam No. 2 at its own cost; that from the power they first take 100,000 horsepower, then give the next 100,000 horsepower to the United States Government with the idea of operating the nitrate plant with it, but also further give the Government the right to use that power as they please?

Mr. WEEKS. It is some months since I have read that offer. When I sent this matter to Congress I dismissed it from my mind, which may account for my hesitation in some of the answers that I am making, but my recollection of the Alabama Power Co. offer—of course, an examination would determine that question—was that the power that it proposed to turn over to the Government was secondary power, not necessarily the second 100,000 horsepower, but that it was power that would be termed technically "secondary" power.

The CHAIRMAN. As I remember it, the Ford offer provides for the transfer to Mr. Ford in fee simple of everything except the dams and the things connected with the dams. The Alabama Power Co. has nothing whatever to do with anything except the dam, and it furnishes this 100,000 horsepower to the Government.

Senator MCKINLEY. It would get the power plant?

The CHAIRMAN. Yes; it would get the power plant. The Government can do what it pleases. The Alabama Power Co. has no offer in regard to the operation of the nitrate plant.

Mr. WEEKS. That is what leads me to say that if the Alabama Power Co., for instance, purchased that property in accordance with their offer, undoubtedly there would be very considerable development in that region somewhere, and perhaps right there at Florence and Sheffield, and that would make the balance of the property which the Government owns very much more valuable than it is to-day, which, to follow that thought, would enable the Government to salvage the property for very much more than it can do under present conditions.

I want to make a comment, Mr. Chairman, which may be purely superfluous on my part, but I think the members of the committee will appreciate that it is done in good faith.

Here is a great development which ought to be utilized. It ought to be utilized for the best interests of the Government and the community. As I have observed, the proceedings of this committee and the House Military Committee, you are proceeding on somewhat different lines. It is no criticism to say that Congress is hardly an administrative body. I think it will be pretty difficult to get any result in the early future out of these properties if Congress is to attempt to make a contract with anyone. I say this with a great deal of hesitation, because I am not seeking responsibility, and I would be glad to avoid it, but I think the businesslike way to proceed in this matter would be to authorize some one to perhaps ask for public bids or to proceed in some logical and businesslike way to dispose of that property, reserving to Congress the right to ratify whatever is proposed, and to appropriate, if any appropriation is necessary. I think by so doing you will get a much earlier solution of this question. Mr. Ford, the Alabama Power Co., Mr. Engstrom, and others are entitled to have it considered and decided at an early day. It is not a bad time to do it. Financing is relatively easy at this time for any of those who have bid, or would be for any other corporation or individual, and I believe you would get a much earlier and better solution if Congress could see its way clear to turn over to some one—engineers preferably, I think—the power to make the best possible agreement that can be made, Congress then having the right to ratify that agreement.

Senator KENDRICK. It is your idea that it would avoid confusion for the Government to lay down and make public the plans under which it wanted to lease the property or sell its interest?

Mr. WEEKS. The War Department has this kind of a question of a minor way almost every day. We are selling properties of one kind or another constantly, and we are trying by every device to get as much out of them as we can. I would rather have somebody else do it, but the War Department would proceed to get the best possible bid for that property, taking everything into consideration, the Government's interest and the local interest and the future, and then that bid, whatever it is, should be submitted to Congress for ratification.

Only last week I sold at Newark, N. J., a development to the city of Newark. A very considerable part of the business of the War Department, a large percentage of its affairs, is doing that kind of work now.

I do not want it, but if the War Department had power to make a contract with somebody, to be ratified by Congress, taking into consideration all the requirements of the Government and the locality and the future, I think you would get action very much quicker, and I think the bidders whose bids are before you are entitled to as early consideration as possible.

Senator SMITH. You mean that the Government, in asking for these bids, would specify the particular things that they want incorporated in this bid?

Mr. WEEKS. Yes.

Senator MCKINLEY. What you mean is that a joint resolution be passed by Congress authorizing the Secretary of War to secure bids which he would submit?

Mr. WEEKS. I don't want you to assume that you would authorize the Secretary of War. I would very much like to avoid it. But my thought is that you would authorize somebody to secure bids. You may follow exactly the same course that was followed in the case of the Cape Cod Canal. The Government had taken over that property, and the Secretary of War and the Secretary of the Navy and the Secretary of Commerce were authorized to make a purchase. They could not agree on a price and it went to the courts. The verdict of the jury was not considered satisfactory, and the Government appealed. Since that time a better price has been made, and there is now pending on the calendar of the House a proposition to buy that property at what I think is a fair price. In any case, Congress in that case did reserve the right to ratify, and, of course, to appropriate, and so far as possible the departments have carried out their instructions.

Senator MCKINLEY. The trouble with the present situation with regard to Muscle Shoals is that all you could do was to receive something that somebody hands you without negotiating with them?

Mr. WEEKS. I had really no power. I tried at first to get something which I could recommend and approve.

The CHAIRMAN. Mr. Secretary, one of the difficulties down there is something that does not exist in anything else that I know of, and I am satisfied it does not exist in any of these cases you are speaking of. The Government has a property there in which it has about \$100,000,000 invested, that everybody concedes we have to keep and keep in readiness, and it is interwoven and has a property there in which it has about \$100,000,000 invested, that everybody interconnected with the Muscle Shoals development there in such a way that it would be conceded, I think, impracticable for the Government to sell everything it has there outright. I don't think anybody would want to do that. And, again, we would probably not be in favor of going in if it was an open question now, but we have gone in and we have spent so much money there, and the question is whether we ought to sell out now and get rid of the whole thing.

Mr. WEEKS. You understand, Senator, that the development of water power at Muscle Shoals is not absolutely essential to our making that plant effective.

The CHAIRMAN. Oh, I understand that.

Mr. WEEKS. It would cost more to use it as a steam plant, of course, but in case of necessity we can be producing the material which we need for war purposes very quickly, as the plant is now, as you saw it.

The CHAIRMAN. When you did that, however, you would eliminate the fertilizer proposition?

Mr. WEEKS. You would eliminate the fertilizer proposition entirely.

The CHAIRMAN. Because everybody concedes that with steam power we can not make fertilizer.

Mr. WEEKS. That is true, therefore that is the crux of the situation. The pressure was just as strong to accept Mr. Ford's first proposition as it was his second one or his third one or whatever his fourth one may be, if there is to be a fourth. I submit that the second and third ones are infinitely better than the first one, and what I have been trying to do, without any prejudice whatever, is to try to get the best proposition possible, hoping that I could get one that I could say I thought Congress ought to accept.

The CHAIRMAN. Now, Mr. Secretary, if we had nitrate plant No. 2 just as we have it now, without having to spend any money on Dam No. 2, it would simplify it a good deal, too, because we could say then, "This is a war proposition, and we will keep it just the same as we keep a battleship, and on the same principle," but we have spent \$17,000,000 on Dam No. 2. Now, the question is, Shall we throw all that away? We have there at Dam No. 2 a complete equipment, consisting of railroads, cars, engines, mixing machines and everything, to go ahead with. Shall we scrap that or sell it to somebody? So that complicates it still more. While it is not necessary to have Dam No. 2 to make nitrate, it is desirable, because it would cheapen the process. We can make it without the water power, as we have steam power enough to run it to its full capacity, but we have spent \$17,000,000 and have a dam across the river there which I think everybody concedes at the present time is in No. 1 condition.

Senator HARRISON. And it is obstructing navigation.

The CHAIRMAN. Absolutely obstructing navigation. If we don't want to do something with it we ought to blow it up.

Senator HARRISON. As I understand the Secretary, he is perfectly willing to go ahead and complete the construction.

Mr. WEEKS. I am firmly of the opinion that Dam No. 2 ought to be completed, because I think it can be done to the advantage of the Government, and I think that community is entitled to something. You have a partly constructed situation there, which is a damper on the development of a community. Moreover, we could liquidate the balance of our property to much better advantage if this development were completed.

The CHAIRMAN. This committee has taken action toward appropriating money to complete that dam, and has authorized me to offer, and I will offer to-day, an amendment to the military affairs appropriation bill authorizing the War Department to go ahead with Dam No. 2 on the theory that whatever else we may do, and whatever action we may take, if any, we can fight out afterwards, but your department should be at work down there now in going on with that dam. Now, do you agree with the committee in that?

Mr. WEEKS. I want to have the committee, if it is going to take that action, authorize the War Department to contract for the completion of the dam and to make such appropriation as the Congress deems best to carry on the work for the next year, because if we do not do that we will not be able to make a contract ourselves, and I think by contract we could do it to better advantage.

The CHAIRMAN. What would you do with the Government equipment then?

Mr. WEEKS. Let the contractor use that equipment. Of course, all this work will be done under the direction of the Government engineers in either case. I think we can save money by doing it by contract.

The CHAIRMAN. If the committee thinks you should proceed in the future just as you have in the past, you would not advise that?

Mr. WEEKS. I would not advise it. We can do it, but I believe in the present condition of affairs—at least we could have done so three or four months ago—we can make a very good contract for the completion of that dam.

The CHAIRMAN. All of the engineers, so far as I have heard them, have agreed with us absolutely in the action we have taken.

Mr. WEEKS. Do you mean the Army engineers?

The CHAIRMAN. Yes.

Mr. WEEKS. I am not disposed to criticize my advisers in that capacity, but as a business man if I had it to do I should contract that work to be carried on under plans and general directions of the Army engineers. You would get just as good results, and you would get them for less money, in my opinion.

The CHAIRMAN. How long would it take you to get those advertisements out. You would have to advertise, I suppose?

Mr. WEEKS. I presume plans are all made, are they not, for the completion of the dam?

Major BURNS. I understand so; yes, sir.

Senator KEYES. That would not delay the work at all?

Mr. WEEKS. It would not delay it. You would be working in 60 days.

Senator BENDRICK. Thirty days would be sufficient time to advertise for bids, would it not?

Mr. WEEKS. I think so.

Senator HARRISON. I think the action of the committee was that the work should proceed, whether by contract or otherwise.

Mr. WEEKS. I have seen it stated in the paper that the committee was considering appropriating seven and a half million dollars for carrying on that work, but that would prevent my contracting the work.

The CHAIRMAN. I don't think the Secretary could contract under the action we have taken.

Mr. WEEKS. I am firmly of the opinion that the Government could save money if I am able to contract.

The CHAIRMAN. Mr. Secretary, the men who have done the work are all there, as I understand it, right on the ground now?

Mr. WEEKS. Yes, sir; the engineers are there.

The CHAIRMAN. Everybody is there, and all the Government machinery is there, and it is all ready to start up if they had the money to do it.

Mr. WEEKS. Yes; at least the men who would supervise construction.

The CHAIRMAN. That is about all they do, anyway, I suppose the actual work is done by employees.

Mr. WEEKS. The machinery is all there.

The CHAIRMAN. Are there any other questions?

Senator SMITH. Would the action of the Government in completing that dam have any effect upon the pending propositions?

Mr. WEEKS. Of course, it would have a material effect on the offer of the Alabama Power Co. It would have some effect on Mr. Ford's offer also.

The CHAIRMAN. I think it is conceded by both Ford's engineers and the Alabama Power Co.'s engineers that while they would have to modify the bids it could be very easily done. It would not necessarily interfere. They would take it at a more completed stage than now; that is the only difference.

Mr. WEEKS. That work will be done substantially as either one of those bidders or any bidder would complete the work, in my opinion. It will have to be done, anyway, under the direction of the Army engineers.

The CHAIRMAN. Have you anything further, Mr. Secretary?

Mr. WEEKS. No.

The CHAIRMAN. We are very much obliged to you.

(Whereupon, at 11.45 o'clock a. m., the committee adjourned subject to the call of the chairman.)

MUSCLE SHOALS.

SATURDAY, JUNE 3, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to call, at 10.30 o'clock a. m. in room 224, Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris, Capper, Keyes, Ladd, McKinley, Kendrick, and Caraway.

STATEMENT OF MR. O. C. MERRILL—Resumed.

Mr. MERRILL. Mr. Chairman, when I was before your committee before I spoke of the various offers that had been made for the Muscle Shoals properties, and you stated that you would like to have me look over the bill which you had introduced and come back later and say what I wished to say with respect to that.

I discussed, when I was here before, the figures in relation to the power possibilities at Dam Nos. 2 and 3 on the Tennessee River. I wish to take up briefly at the start to-day the relation between the power available there and the nitrate plants.

The figures that I shall use here with respect to nitrates I have taken from what Major Burns has given me, and if I make any misstatements, I wish Major Burns would correct me now, because nitrate is a matter with which I am not personally familiar.

I understand plant No. 2 has a capacity of 110,000 tons of ammonium nitrate per annum, containing 40,000 tons of fixed nitrogen. Plant No. 1 I understand has a capacity of 22,000 tons of ammonium nitrate containing 8,000 tons of fixed nitrogen. This means that the two plants have a combined capacity of 132,000 tons of ammonium nitrate per annum or 48,000 tons of fixed nitrogen.

With a 2 per cent nitrogen content for fertilizer there will be enough nitrogen produced at plant No. 2 to mix 2,000,000 tons of fertilizer, and at No. 1 to mix 400,000 tons of fertilizer, a total of 2,400,000 tons, which is about 30 per cent, as I recall, of the total fertilizer production of the United States at the present time, such total being about 8,000,000 tons.

If the nitrogen content were 3 per cent there would be produced from the two plants sufficient nitrogen for 1,600,000 tons of fertilizer, or about 20 per cent of our total present requirements.

The amount of power required for the production of a ton of fixed nitrogen by the cyanamid process, Major Burns tells me, is 15,000 kilowatt hours. The full operating requirements, then, for nitrate plant No. 2 are 600,000,000 kilowatt hours per annum.

Under the Haver process 8,000 kilowatt hours are required per ton of fixed nitrogen, which would mean an annual power requirement of, I should say, 4,000 kilowatt hours, not 8,000. There are 8,000 tons of fixed nitrogen capacity in plant No. 1, which would require, therefore, annually, for full operation, 32,000,000 kilowatt hours. This is on the basis of using no electric power for

the production of the hydrogen gas. If the hydrogen gas is produced by electrolysis of water, Major Burns tells me that a ton of fixed nitrogen would require 18,000 kilowatt hours, or a total for the 8,000 tons production of plant No. 1 of 144,000,000 kilowatt hours per annum.

So that on full operation we have either one of two figures. For nitrogen production alone in the two plants, 632,000,000 kilowatt hours; for nitrogen production plus hydrogen production for plant No. 1, 744,000,000 kilowatt hours. These are equivalent, on a 100 per cent load-factor basis, to 97,000 horsepower for the lesser of the two propositions, and 114,000 horsepower for the other.

If we translate these figures over into the power requirement per ton of fertilizer, we will find that under the cyanamid process (plant No. 2) the kilowatt hours required are 300 to 450, according to whether we assume the nitrogen content to be 2 per cent or 3 per cent of the fertilizer. By the Haber process the kilowatt hours will be 80 to 120, and if electric power is used to secure the hydrogen gas, 360 to 540; in each case according to whether the percentage of fixed nitrogen in fertilizer is 2 per cent or 3 per cent.

On this basis the power cost per ton of fertilizer for every mill per kilowatt hour for electric energy will be: By the cyanamid process, for a 2 per cent content, 30 cents, and for a 3 per cent content, 45 cents; by the straight Haber process, with 2 per cent fertilizer, 8 cents per ton; for 3 per cent fertilizer, 12 cents a ton; and if power is used for the production of hydrogen gas, these figures would change to 86 cents per ton for the 2 per cent content and 64 cents per ton for the 3 per cent. That is, understand, when the power costs only 1 mill per kilowatt hour, and these figures will have to be multiplied by the factor which represents the actual cost of power in terms of mills per kilowatt hour.

The CHAIRMAN. For instance, if it were 2 mills per kilowatt hour you would double it?

Mr. MERRILL. It would be just twice these figures.

If we take the existing combination at Muscle Shoals of plants No. 1 and No. 2, without the use of power for the production of hydrogen gas, and at a rate of 1 mill per kilowatt hour, the power would cost, under the 2 per cent content, 26.6 cents per ton of fertilizer, and for the 3 per cent content, 39.5 cents per ton of fertilizer; and if power is used for electrolysis at No. 1 the figures would be increased to 31 cents per ton for 2 per cent fertilizer and to 46 cents per ton for 3 per cent fertilizer.

Senator MCKINLEY. Now, what does that tell a layman?

Mr. MERRILL. It simply means this, that you can tell, if you know the probable price of power per kilowatt hour how much of the cost of a ton of fertilizer is represented by the power.

Senator MCKINLEY. I know; but what you have told us, what does it tell a layman?

Mr. MERRILL. It tells the layman, I should think, that the power cost in fertilizer for every mill that he pays for power is only about 30 cents per ton of fertilizer.

Senator MCKINLEY. But what does that mean?

Mr. MERRILL. It means, in my judgment, that the cost of power is a very small element in fertilizer production; that it is other factors which are the determining ones there; and that with respect to the general situation at Muscle Shoals, whether the Government develops the power itself at a cost of 4 or 5 mills, or whether it buys from somebody else, or whether it accepts some such offer as the Alabama Power Co. has made of turning over a certain amount of power free of cost, makes very little difference in the actual cost of the fertilizer to the man who uses it; that it is other factors rather than the factor of power that are the real determining factors in the cost of fertilizer, and that far too much weight has been given to the claim that the cheap power at Muscle Shoals necessarily means a very considerable reduction in the cost of fertilizer.

Senator KENDRICK. In other words, your conclusion is that in the committee's action in dealing with Muscle Shoals it should not be controlled by the question of cost of this power in producing nitrates?

Mr. MERRILL. Unless you are otherwise required to get your power at a very considerable cost. For example, power at 1 cent per kilowatt hour would mean about \$3 per ton for the power cost of a 2-8-2 fertilizer. If you get above that point you are getting into figures that really constitute a consider-

able percentage of the total price, but 1 cent per kilowatt hour is higher than the current rate in Alabama for power in the quantities required for plant No. 2.

I don't know just how fertilizer prices are at the present time. The Bureau of Soils gave me figures yesterday which showed that 2-8-2 fertilizer had a manufacturer's sale price of about \$46 per ton in 1920. I got a quotation from a local dealer here yesterday for 2-8-2 fertilizer at retail of about \$26.

The CHAIRMAN. At about what?

Mr. MERRILL. \$26.50 per ton retail of 2-8-2 fertilizer in the city of Washington.

The CHAIRMAN. How does that compare with this—

Mr. MERRILL. It is about half of the wholesale price of 1920.

Senator KEYES. Have you the wholesale price now?

Mr. MERRILL. The wholesale price? They gave it as \$25 per ton wholesale.

The CHAIRMAN. And \$26 retail?

Mr. MERRILL. \$26.50 retail.

The CHAIRMAN. That is rather a demonstration of the fact that fertilizer has gone down quite a bit?

Mr. MERRILL. It has gone down very materially.

The CHAIRMAN. It has gone down very materially in the last year.

Mr. MERRILL. The 1-7-1 was quoted to me at \$22 per ton retail. I have no corresponding quotations for 1920. But the quotations for 1920 varied from \$32.75 for 1-8-0 composition to \$67 for 4-8-4. Doctor Whitney, of the Bureau of Soils, tells me that the market for fertilizer and the prices of fertilizer are so erratic now that he is not willing to quote even an average price.

The CHAIRMAN. Why? Did he tell you why?

Mr. MERRILL. He said that one could get fertilizer for most any price that he would offer in cash.

The CHAIRMAN. By that we are to understand, are we, that the fertilizer people are in such financial straits that they are taking any price that they can get in cash for it?

Mr. MERRILL. I would rather suspect that both quantities on hand and the uncertainties of the future are responsible for it. That is something, however, with which I am not personally familiar.

The CHAIRMAN. We had considerable testimony in regard to the fertilizer people. They claim to be in very stringent financial circumstances; they have not been able to sell, and they have had to sell on time in a great many instances, and have not been able to collect their notes.

Mr. MERRILL. Until the price, or the cost, of power elsewhere gets up beyond, I would say, about one-half cent per kilowatt hour it would appear that fertilizers can be produced materially cheaper at Muscle Shoals only if some new or cheaper process for fixing nitrogen is discovered, or unless losses on nitrate production are made up from profits on something else, or unless some of the costs are ignored. If the Government or anybody else goes into the production of nitrogen at Muscle Shoals, it is to be assumed that they will endeavor to improve the process by every means they can. It must also be assumed that those in competition will be doing the same thing; and the possibilities, I would judge, not from my own knowledge but from what I read and hear about the nitrate situation—the possibility of cheaper fertilizers or cheaper nitrates for fertilizers is more a question of new processes than of cheaper power for their production.

There are several considerations that might be taken into account in determining what should be done with the properties at Muscle Shoals. There are large investments there, both in the two nitrate plants and in certain steam plants. They were built primarily for the purposes of preparedness in time of war, particularly for the immediate purposes of the recent war. I understand from testimony presented to your committee that the retention in operation or in condition for operation of nitrate plant No. 2 would be adequate as a war preparedness measure, with respect to nitrates; that the plant will be more suitable for that purpose if it is operated in the production of fertilizers than if it is merely held in a stand-by condition, for the simple reason that if it is kept in operation it will probably keep up with any changes in processes and will be improved as methods improve.

I had a table, which I forgot to bring along with me, which shows the relation between the 600,000,000 kilowatt hours required for the full operation of

nitrate plant No. 2 and the amount of power available from Dam No. 2, hydro alone, and from dam No. 2 with the steam used in connection with it. I will give some of the figures as nearly as I can recall them from memory and then I will change them in the record if necessary.

With an installation of 240,000 horsepower at Dam No. 2, with a load factor of 75 per cent, the maximum daily average power that you could get with all the water you needed would be 180,000 horsepower. That is, three-fourths of the installation. There is not enough water in the river to produce 180,000 horsepower all the year through at Dam No. 2, but according to the figures that we have the total would have dropped down to as low as 75,000 horsepower for one or two days in the 26 years of record. The average, however, for the year through and for the 26 years with 240,000 horsepower installation would have been about 1,131,000,000 kilowatt hours, or approximately twice as much as the requirements for operation of nitrate plant No. 2 to full capacity. That figure does not include the 130,000 horsepower steam. If the hydro plant can operate on a 60 per cent load factor only the figure, of course, is slightly less, but in any event, with plant No. 2 developed, with an installation of only 240,000 horsepower at the dam, and with the steam plant forgotten, there is approximately twice as much energy in kilowatt hours as is required for the full operation of nitrate plant No. 2.

My first conclusion from this situation is that unless the United States is going into the fertilizer business on the proposition of monopolizing the market and supplying the full requirements of the United States, it does not need more than Dam No. 2 for fertilizer purposes, and that there is no occasion, in any event, at the present time for considering the development of plant No. 3, or of any other plant, or reservoirs on the upper Tennessee in connection with such nitrate production as is possible with the existing nitrate plants, and that, even in the event that the United States proposed to go in there and double or treble the capacity of nitrate plant No. 2—which would mean construction of new nitrate plants—there would still be sufficient power for operation with an installation of 240,000 horsepower at Dam No. 2, for such installation plus the 130,000 horsepower of steam, both operating on a 75 per cent load factor, would produce approximately 1,800,000,000 kilowatt hours, or three times the 600,000,000 required for full operation of plant No. 2.

Muscle Shoals Dam No. 2—Power production with certain installations and assumed load factors.

Another question that might arise is the relation of additional developments on the Tennessee to the general power requirement of the Southern territory, on the assumption that any power not needed for nitrate operation will be disposed of in the southern market. The five Southern States—North Carolina, South Carolina, Alabama, Georgia, and Tennessee—have had an increase in power requirements of about 200,000,000 kilowatt hours per annum for the last 10 years. If that figure is correct, or approximately correct for the future, the power available at Dam No. 2, hydro alone, after meeting the full requirements for nitrate operation at nitrate plant No. 2, would carry this demand for two years, with a 240,000-horsepower installation. It would carry it for six years if the installation is 480,000 horsepower. If you add to the hydro power from Dam No. 2 the steam power available from the steam plants, a 240,000-horsepower installation at Dam No. 2 would carry the southern demand for six years into the future, and a 480,000-horsepower installation would carry it for 10 years into the future.

The CHAIRMAN. If we install 480,000 horsepower, that means that would be secondary, would it not? Dam No. 2 will not make that much.

Mr. MERRILL. With Dam No. 2 and the steam plant both operating, the primary combination from the two is about 230,000 horsepower.

The CHAIRMAN. Yes. Well, then, what do you demonstrate by saying if we installed 480,000 we would not be able to use it after we had installed it?

Mr. MERRILL. If you install 480,000, your maximum daily average is only 360,000 on a 75 per cent load factor basis.

The CHAIRMAN. To make power and supply the increasing demand of the country that you are talking about, it would have to be primary power, would it not?

Mr. MERRILL. Very likely primary.

The CHAIRMAN. You could not count on secondary power for general purposes, could you?

Mr. MERRILL. Of course, these figures that I have given of the years ahead that this one dam, plus the steam plant, would take up the demand leaves out of consideration the fact that other plants are being built in that territory also. This, however, is the conclusion that I would reach. On the basis either of providing power for operation of nitrate plant No. 2 or for having a surplus to meet the probable demands in the near future in the general southern mar-

ket, there is no need at the present time of considering development beyond the development of Dam No. 2.

The CHAIRMAN. Now, ought we not to consider, if we were going to make development by the construction, let us say, of Dam No. 3, that that of itself would attract enterprises that would call for more power and that instead of comparing it on the increase of the past you would have to take into consideration the fact that the very development itself would bring in industries, so that it would probably increase at a much more rapid rate?

Mr. MERRILL. That is quite probable, that this rate of 200,000,000 kilowatt hours per annum would be increased, but it would not be the part of wisdom to put in a heavy investment in Dam No. 3 when you had the prospect of having to wait for five or more years before you could utilize your full developments at No. 2.

The CHAIRMAN. Oh, I agree with you that we ought not to go too fast. We ought to take that into consideration, I think. There is no use developing power that will not be used.

Mr. MERRILL. If you were handling the matter from a business proposition you would have your costs very materially increased by your interest on idle investment while waiting for your load to develop.

The CHAIRMAN. I would like to get your views on this. To my mind it is very important. We could very well develop Dam No. 2 and let other power dams alone and let private industry take it up and let them take it up as they saw the need of it, as they probably would, and there would be some use for it, but the question of storage reservoirs that you mentioned a while ago, covering such a large scope of country, it seems to me almost necessary to be taken up by the Government, in order to make not only Dam No. 2 but the other dams that may be constructed in the future more attractive as a development proposition and cheapen the power very materially.

Mr. MERRILL. I do not think it is necessarily true that the Government must put in these storage reservoirs even if they are quite expensive. The time will come, if there is enough development on the Tennessee—when Dam No. 2 and Dam No. 3 are built, we will say—when probably the cheapest method of adding to the power at those sites would be by the development of storage, a method which would require only the installation of additional machinery at those two sites to develop additional power, rather than going elsewhere on the river to build a dam merely to get head. But the question of when you can economically increase your power at sites such as the Tennessee has by the development of storage is dependent upon the relation between the total head at the several sites and the cost of the storage reservoir.

The CHAIRMAN. Oh, yes; it might be so expensive that it would not be a practical proposition. I admit that.

Mr. MERRILL. We have a provision in the Federal water power act, put in specifically to meet a situation such as this, if any concern is developing power on the Tennessee it will naturally develop storage just as soon as it can get more kilowatt hours out of a dollar in storage than it can out of a dollar in new generating plant. If there are several concerns operating there, they may, by acting together, find the provision of storage advisable for the group of plants much earlier than if each is acting independently.

The CHAIRMAN. Yes.

Mr. MERRILL. So we have a provision in the water power act that if one of a number of licensees of the United States builds a storage reservoir the annual cost of interest, depreciation, and maintenance on that reservoir shall be shared by all.

The CHAIRMAN. Yes.

Mr. MERRILL. That was deliberately put in the act so that a concern which could not afford to build for its own purposes these costly storage reservoirs might afford to do so if they could have the annual cost distributed between themselves and other users.

The CHAIRMAN. Still it leaves it so uncertain, to my mind, it seemed to me very doubtful whether a private party owning a dam on the Tennessee would go up on the tributaries and construct storage dams. They would first have to put up the money, and it would take a good deal of money to do it, and the amount that would be contributed by other people would be uncertain, and they would have to bear the entire cost and depend on getting their money back from other people in the future. So I have doubted very much, unless it was some very attractive proposition, whether a private party would do that, or whether he could afford to do that, considering it solely on a financial basis, as they

would consider it. Now, that being true, if there are possibilities of storage dams up there—of course, if there are not, then we are through—but if there are, at reasonable cost, and since the Government itself is interested in the biggest dam of all that will ever be constructed there, it seemed to me very appropriate that the Government should do that, it really being the only party that could afford to do it, and then get contributions under the law from parties who use the water.

Mr. MERRILL. I would very much rather see the Government—I think it would be very much more appropriate for the Government, if it were making any development at all on that river or spending any money for power purposes, to expend it in storage reservoirs which would increase the power of the river, and where there would be no complications of Government operation, than to build power dams and power houses and have matters complicated by the necessity of Government operation.

The CHAIRMAN. You may be entirely right. Of course, at least there are a good many good arguments that can be offered to that. But I was trying to bring you to that point about the storage reservoirs. I may be wrong, but to my mind the storage reservoirs on the Tennessee River will probably never be developed if we wait for private parties to do it, for the reasons that I have outlined. I hope I am wrong about it, but it does not look to me as though it is an attractive proposition for a private party to do it.

Mr. MERRILL. Major Burns, are they not developing storage reservoirs now on the Little Tennessee?

Major BURNS. Not to my knowledge. Maybe the Aluminum Co. is doing something of that sort, but I don't know.

Mr. MERRILL. They had proposals, I know, for quite an extensive reservoir development on the Little Tennessee. What is that on the map up there?

The CHAIRMAN. I think, Mr. Merrill, that map is somewhat of a propaganda.

Mr. MERRILL. That is the Tennessee River Improvement Association's map, of course.

The CHAIRMAN. Yes; and I would like to ask Major Burns about that map. I have been intending to do it for a good while. Major, do you know anything about that map?

Major BURNS. No, sir. I was not here when it was talked about.

The CHAIRMAN. Do you know whether the dams indicated there on the map have been investigated, or what investigation has been made in regard to them?

Major BURNS. There has been no official investigation made by the Corps of Engineers. Colonel Barden testified that the district engineer at Chattanooga was now making a more or less general survey of the storage dam possibilities of all that region, but that he had not completed it as yet.

The CHAIRMAN. Now, Mr. Merrill, there is another thing I wanted to call your attention to about these storage reservoirs that to my mind is quite an important one.

Won't they become more expensive as time goes on? Can it not be done now cheaper than in years to come, when the general situation will be more fully recognized, and the country more thickly settled up, the country settled up more in the mountainous region, and the land which will be necessarily overflowed be bought up for speculative purposes?

Mr. MERRILL. There is always that possibility. The land is not likely to decrease in value, and the construction costs are not likely to decrease. I don't mean that they won't decrease below the war level, but the general curve of costs is more likely to rise than fall; nevertheless you have to offset against that possibility the certainty of heavy carrying charges if you develop your storage reservoirs before the time they are needed.

The CHAIRMAN. Yes; but assuming we should go ahead now with Dam No. 2 that we are constructing, we would get some benefit out of it right away. They could not get those constructed before Dam No. 2 would begin to operate and we would begin to get some benefit right off, and other private parties that had dams there—and there are several—would be liable for their proportionate part of the expense. So we would get some direct benefit and we would get some contribution.

Mr. MERRILL. Do you feel certain of that from a legal standpoint that the people who are now on the river—

The CHAIRMAN. No; I would not say that I am certain about it. I think there is a very serious legal question involved in it. But that brings us to another proposition, Mr. Merrill, that the very uncertainty, it seems to me.

makes it extremely important that the Government should enact a law that would apply particularly to the Tennessee River and at least prevent all doubt in the future about anybody going in there and getting the power. We can easily do that.

Mr. MERRILL. You can well enact a law that would apply to all navigable waters, that anyone building on that stream after the enactment would be—

The CHAIRMAN. I think we did that in the water power act.

Mr. MERRILL. That applies only to licensees. I should add, however, that nobody can go ahead in the future on a navigable stream and develop without being a licensee of the Government. Therefore, the provisions of the Federal water power act, to which I have referred, affects all future development on navigable waters, whether the headwater improvement is made by the United States or is made by a licensee of the United States, but it applies only to the payment of a proper share of certain specified annual charges and not to original construction costs. But, generally, Mr. Chairman, I wish to present it as my opinion that, unless the United States proposes at Muscle Shoals, either itself or through some agency, to develop nitrates in excess of the capacities of the plants now there, Dam No. 2 will more than supply its needs with hydropower alone, while with the steam in combination it will very much more than supply its needs; that, therefore, there is no occasion at the present time for proposing any development at No. 3 or others on the river for purposes of nitrate operation; that the probabilities are that the additional power from Dam No. 2 and from the steam plants in excess of the requirements from nitrate production will carry the load that should be properly assignable to the Tennessee for general distribution purposes in the southern territory for quite a number of years in the future; and that on this basis also there is no occasion at the present time for developing either Dam No. 3 or other powers along the river.

The CHAIRMAN. What did the Government have in view when it started in at Dam No. 3? Do you know? We have spent considerable money there already.

Mr. MERRILL. I can not say. There was one purpose in addition to the power, which it had in view, and that was navigation and that purpose, of course, we have now. Yet with the completion of Dam No. 1 and Dam No. 2 you will not have your navigation all the way up the river.

The CHAIRMAN. No; but it will make it better.

Mr. MERRILL. It will make it much better.

The CHAIRMAN. It will improve it very much, as far as it goes.

Mr. MERRILL. It will extend it beyond the point where it is now and make it very much superior to what it is now in those small canals along the side.

The CHAIRMAN. And outside of the maintenance of the locks it would be practically a permanent thing in navigation.

Mr. MERRILL. Yes.

The CHAIRMAN. As permanent as the dams themselves. It would not need any dredging or anything of that kind.

Mr. MERRILL. Assuming that Dam No. 2 is developed and assuming for the moment that it is developed by the United States, the question arises what disposition is to be made of the surplus power. If the Government develops the dam it might lease it for private operation and retain for its own use the 600,000,000 kilowatt hours necessary to operate nitrate plant No. 2; or it might operate the plant directly and sell the surplus power in the general market. If it does the latter it means, of course, the Government going into business. It means the construction of transmission lines, either by the United States into the territory south of Muscle Shoals, or the extension of their lines by existing distributing companies in order to take the power from Muscle Shoals; or the construction of lines by communities that may be direct purchasers of the power. I spoke the last time I was here of the undesirability, in my opinion, the extreme undesirability of confining this power that may be developed on the Tennessee River in the vicinity of Muscle Shoals to that immediate territory. I said that I believed it ought to go into the general power system of the South and be available for all the people in that great territory rather than for the benefit, even, of an extensive industry in the vicinity of Muscle Shoals itself. Now, I assume that the United States—

The CHAIRMAN. Now, might I interrupt you there? If you do that and provide that it shall go into general industrial development of the entire country rather than development of local commercial establishments that will be con-

structed, that would mean that the present network of lines that connect up with them, which would be the most economical way to do, no matter who owns them, would be very greatly extended. They could reach down to New Orleans.

Mr. MERRILL. They could reach to New Orleans if there is a sufficient block of power to go into the system.

The CHAIRMAN. That bears again upon your proposition that we have power enough to last for several years without any more power developed in that vicinity. If the system were extended, for instance, if it took in New Orleans and the territory intermediate, assuming that it reached as far as New Orleans, with all its industries, it would make wonderful demand for power, would it not?

Mr. MERRILL. That would increase the demand very materially. It would probably increase it 50 per cent.

The CHAIRMAN. And is not that a practical thing?

Mr. MERRILL. I think it is.

The CHAIRMAN. Well, is it not extremely probable that if this power is developed at the Tennessee River, New Orleans and all the surrounding country will be included in this territory and supplied with electricity?

Mr. MERRILL. It is if there is a sufficient block of power available from Muscle Shoals to do that, and if it can be secured under conditions that will permit. If it were developed by the Government it would have to be sold under very long term contracts because there would be tens of millions of dollars worth of investment to utilize it.

The CHAIRMAN. Certainly. That would be true no matter who supplied it, would it not?

Mr. MERRILL. Yes. And if it is developed by a lessee of the United States, the same development or same investment, of course, goes in.

The CHAIRMAN. Yes.

Mr. MERRILL. The point I have is that the conditions under which the power is sold, if generated by the United States, should be comparable to the conditions under which properties would be leased for construction by another.

The CHAIRMAN. I don't know that I just get that.

Mr. MERRILL. That is, it would require to be long-term arrangements.

The CHAIRMAN. Yes.

Mr. MERRILL. Just the same as we have a long-term arrangement where moneys are put into the development of the plant itself under the Federal water power act.

The CHAIRMAN. Yes. I think that is quite true. As a matter of common justice, now, to the people of the United States, is not that what ought to be demanded by Congress in power development on navigable streams, rather than to give to some individual or a set of individuals, or a little community an advantage over every other individual, or an advantage over every other community that gets its advantage by the utilization of something that belongs to the entire people of the United States? Why should it not be spread out as much as possible and give as many people the benefit of it as we can?

Mr. MERRILL. I most emphatically think it should.

The CHAIRMAN. That is what I think.

Mr. MERRILL. Now, my general conclusion with respect to the situation down there is this: That whether the Government itself does or does not complete the development of Dam No. 2, it should reserve for itself the amount of power necessary to operate the nitrate plant; that it would be doing that practically as a measure of war insurance, to maintain in condition a plant for the production of nitrates in case we should get into war in the near future, or until such time as other processes or other plants are developed elsewhere, so that there is no longer the necessity of the United States doing so, and that it should limit its operations to that.

The CHAIRMAN. I might be able to compromise with you by —

Mr. MERRILL. Perhaps I have not made that statement clear. It should limit its operations with respect to nitrates to what can be done with plant No. 2, and whether it wishes as a peace measure to go into the production of fertilizers by the use of nitrate plant No. 2 is a matter of policy for Congress to determine, but if it does it should not expect to make a profit; it should endeavor to produce them as cheaply as it can, of course, but it should frankly adopt the proposal that it is maintaining this investment here as war insurance, that it is making the best utilization of it that it can during peace times, and if it does not make a profit, well and good. As far as the power end is concerned,

the Government itself should either do one of two things: It should either lease the property as it stands or it should complete it and then lease it. I do not believe the Government should go into the operation of the plant there and go into the business of selling power. Personally, I think with no very serious modifications, the offer presented to you by the Alabama Power Co. furnishes a very good solution of the handling of the power end, on the assumption that the United States proposes to maintain nitrate plant No. 2, proposes to hold title to it, and proposes to operate it itself unless it can make better arrangements. I would substitute, if the matter came to me, for the 100,000 horsepower, which is rather an indefinite matter, since it is secondary power, a statement in terms of kilowatt hours, and I probably would say that since nitrate plant No. 2 would require for maximum-production purposes 600,000,000 kilowatt hours per annum, the United States should have the second 600,000,000 kilowatt hours as an offset to the interest charges on the \$17,000,000 of Government money now invested in Dam No. 2, and that in other respects the lease of the dam should be handled precisely as it would be handled in any other proposition on a navigable river, under the provisions of the Federal water power act.

The CHAIRMAN. Now, that would eliminate plant No. 1, would it not?

Mr. MERRILL. Now, with respect to plant No. 1—

The CHAIRMAN. That is not so important so far as its capacity is concerned, but as far as the improvement of the extraction of nitrogen from the air and that development is concerned, which is very desirable both as a war and peace proposition, No. 1 becomes, I think, quite an important factor.

Mr. MERRILL. I would think it would be quite desirable to retain plant No. 1—the title would be retained under this arrangement—and to maintain and operate plant No. 1 for purely experimental purposes, because I think that if the Government itself, or through an agent, goes in at Muscle Shoals in the production of nitrates, one of the purposes it should have constantly in mind is experimentation in the development of new processes.

The CHAIRMAN. It would be a serious mistake if we let down now and did not try to improve the process that everybody admits is in its infancy, and if it could be improved it would be a wonderful thing in the fertilizer line and also as a war measure.

Mr. MERRILL. There are several reasons why, in my personal judgment—and I went into this somewhat the other day when I was up here—the Government should not go into the business of manufacturing and selling power. The primary reason is that Governments are political organizations and not business organizations. They necessarily are such. They have been created to reflect the political ideas and to carry out the political policies of the people, and from the very fact that they are organizations of such character, business operations, when conducted by Governments, can seldom, if ever, get away from a certain amount of politics. And when I say politics I do not mean partisan politics. Even the provision of the bill that you have here, by which the directors are appointed by the President, with the advice and consent of the Senate, and hold office during life or good behavior, and are presumably removable only by the President on charges of misbehavior or by a concurrent resolution of the Senate and the House, do not mean that that is the only way that they can be gotten rid of, because the legislation could be amended and there could be substituted for the "board of directors" a "board of managers," thus legislating the original appointees out of office. That, as you probably know, has been a frequent procedure under State legislation for getting rid of administrative officers who could not be legally removed otherwise. I believe that the State of New York has offered an example of that sort of procedure, and that the State of Illinois recently, in order to dispose of its public utilities commissioners, created a State commerce commission, thereby legislating the old commission out of office.

The CHAIRMAN. The thing that brought about the demand for the change in those cases was that the old officials had run the thing into politics, was it not?

Mr. MERRILL. I suspect the reason is largely this—and there have been instances of it, particularly in the last few years—that the public thought that public service commissions were established only to reduce rates, and when the situation came about of the extremely high prices and costs brought upon public service corporations by the war, and the commissions started to raise rates to meet that situation, there was a public clamor in opposition to the action, and many a State public utilities commission has had a very difficult situation to meet. Some of them have not escaped the storm. Some commissions have

been abolished or their members removed, while in other cases they have succeeded in weathering the storm. The public as a whole has not yet realized that public utility regulation means increase of rates, when necessary, as well as decrease of rates.

The CHAIRMAN. Those comparisons you have given, to my mind, would not be fully applicable, at least down here, because the instances you have cited are those in which the public service commission was dealing with the rates in which all the people were coming in direct conflict every day. That is not true down here.

Mr. MERRILL. You are intending here by your board of directors to fix the price of fertilizers not only for those of its own production but for those produced by others from the products of Muscle Shoals.

The CHAIRMAN. The fertilizer costs, if they were increased as far as the power is concerned, they never would be materially increased as long as there was no accident to the dam or something of that sort, because, regardless of railroad rates, the water would tumble down over the dam just the same when prices were high, and it would not cost any more than when prices were low. It would be something, it seems to me, that it would be so easy for anyone to see whether there was a manipulation there. It would not be connected up with a system of railroads or a dozen systems of railroads that are so complicated that the ordinary person in a lifetime would hardly be able to understand all their intricacies. If they raised the price of power that they sold, for instance, it would be a very easy thing to tell why in such a way that everybody could see it, and as to whether they would raise the price of power when other things went up, it would not follow, because the main thing in making the power is the water-power development, which is not affected by the price of labor or of steam or of coal, only in a limited degree.

Mr. MERRILL. Not to any material degree. Only to the extent that they might be using that steam plant would they be affected by it.

The CHAIRMAN. Yes.

Mr. MERRILL. But I think that the chief reason why Government business operations do not seem to succeed—

The CHAIRMAN. Is it not true that the people demand decreases or object to increases in rates to a great extent on account of manipulation by private individuals that affect the costs—private individuals and private corporations?

Mr. MERRILL. Because they think they do.

The CHAIRMAN. Yes. That is a historical fact in the railroads, for instance, that has been true from the beginning of the railroads down to the charge just recently made by the Interstate Commerce Commission against the Pennsylvania. Although it has been said in the past few years that all those things were past and the railroads did not do it any more, the Interstate Commerce Commission, in the case of the Pennsylvania Railroad and one other railroad, have claimed, at least, that they had practiced deception on the Government to the amount of six or ten million dollars.

Mr. MERRILL. In contracting out their repair work?

The CHAIRMAN. Yes.

Mr. MERRILL. Yes. There has been a corporate history in the past that present corporations, no matter how well they are conducted, have not been able to live down.

The CHAIRMAN. And in a great many instances their conduct to-day is such that they can not expect to live them down.

Mr. MERRILL. I think the greatest handicap in the Government handling business operations is its attitude toward its personnel.

The CHAIRMAN. I don't disagree with you, Mr. Merrill. I think there are some serious difficulties. For instance, speaking of getting into politics, now, I don't know of any railroad of any magnitude but what has been in politics more or less, and sometimes to such an extent that they have absolutely controlled an entire State, an entire legislature, and had a very material influence on the selection even of the United States judges, and all such things as that. They have been in politics all their lives. They are still in.

Mr. MERRILL. You are probably well aware that in the State of California the railroad company for a long time practically owned the State. It did when I first lived there. It lost it later.

It is my personal judgment, with respect to operations of a business kind, like the development and sale of electric energy, that unless the Government can not make a reasonable arrangement with others it should not undertake

to go into the business itself; that it is not for the best interests of the ultimate consumers of power, because it is not likely to result in the development and production of power at as low a cost as properly regulated private capital can do it—and, of course, I stress "if properly regulated."

The CHAIRMAN. Do you know of any instances—and I am not saying there are none; I would like to study them if there are—where, in Government operation of any public utility anywhere, the officials that have had charge of it have been as completely removed from partisan political influence as the officials of this governmental corporation set up in this bill?

Mr. MERRILL. No; except in Ontario.

The CHAIRMAN. I was speaking of the United States.

Mr. MERRILL. Not in the United States. But, of course, you come back to this situation, that even with your bill there have to be moneys expended, there have to be appropriations from Congress to carry this work forward, and these operations are bound to come before Congress every time an appropriation comes up, and any questions that relate to the price of the product and the disposition of the product are going to be brought into the consideration of whether this appropriation shall be granted or not and what restriction shall be put on the appropriation; and it is the restrictions that are put on it, more than anything else, that militate against a business operation by the Government.

The CHAIRMAN. My idea of the corporation would not be that it would require governmental appropriation to carry on its business.

Mr. MERRILL. It would for construction purposes.

The CHAIRMAN. Yes. The bill that I have introduced does not permit this corporation to construct, as it is now. It might be desirable to change it, to turn that over to them. However, it did not do it in the bill. But it could easily be arranged so that they would be as independent of Congress, unless Congress should change the law, of course, as a private individual would be. I wanted to do that. I wanted to put it in such a shape that it could be just as free from governmental influence as a private individual would be, or a private corporation.

Mr. MERRILL. I think you have gotten as far in that way as possible to go, but I do not think it is possible to make it free from such consideration or from such influences as I have mentioned.

I wish to speak just briefly about the particular arrangement proposed in your bill. I believe if it is ever possible for the Government to conduct business operations on business methods it will have to be through a corporate organization. It will have to be done by an organization to which Congress is willing to grant adequate authority and responsibility and which will act in the same relation to Congress as the managers of a corporation act to its board of directors. The three members that you here call the board of directors are not in fact the board of directors. The real board of directors of this operation, like every other Government operation, is the Congress of the United States. They occupy the same relation, in my judgment, to the executive branch of the Government, or a parallel relation, that the board of directors of a business organization bears to its executive officers.

I don't know whether your measure proposes that the three directors shall have equal authority in management of the business. If so, I would doubt its advisability. I think there should be a group of men, whether three as proposed here or more, whose business it shall be to determine the general policies, the general lines under which the operation should proceed, etc., but that when you get down to actual administration you should concentrate the authority in an individual and make that individual responsible to the group that establishes the policy.

The CHAIRMAN. I may not have expressed it properly, but the bill is only tentative anyway. That was my idea. For instance, I did not conceive now that the President, in appointing these members, should necessarily select a chemist who would know about nitrogen, or select an engineer who would know about the control of the dam or its construction, or select a man who was familiar with the sale of power and has experience in that line, but that they should be broad-minded men who would be able to declare a policy, and in the experimental work they would employ chemists; they would employ engineers; and they would employ a business salesman, perhaps, in some other line. I don't believe the board of directors managed by experts, one of them a chemist, another an engineer, would be successful perhaps. I notice the great railroad corporations and other corporations are not operated that way. Great corpor-

rations are not organized that way. The men who are the board of directors and select the president and select a manager or superintendent, select those men because of particular qualifications they possess for the kind of work they want them to do. But still they have general administrative control over them all the time.

Mr. MERRILL. The point, I think, is merely this: That when policies have been established and it is up for decision whether this thing shall be done or that thing shall be done or another thing shall be done to carry out the policy, it should not be a matter that would have to go before a board meeting for decision. There should be one man with authority and responsible, a general manager, we will call him, of the whole undertaking, responsible to the board of directors, and who will have full authority to execute the policies of the board itself. For example, to have every work order O. K'd, every expenditure O. K'd.

The CHAIRMAN. Oh, no. I would not want to do that. That is not my idea at all.

Mr. MERRILL. I have, personally, great doubt whether you can get a man of the character to do that under the salary limitation fixed in your bill.

The CHAIRMAN. That seems to be more or less the universal opinion. Maybe that ought to be increased.

Mr. MERRILL. If not, you will be likely, in my judgment, to get inexperienced men, therefore men not properly competent to handle the proposition. Or you may be able to find men who have private means and to whom the salary means nothing, who will accept the position.

The CHAIRMAN. That, of course, I think is an objection that is serious and ought to be considered. It, however, can be very easily remedied. I do not believe that we necessarily have to have men with great big salaries in order to do good work. I may be wrong about that. For instance now—I think I can say this without any embarrassment, because nothing of that kind, of course, will ever come to me—I feel without, I think, being at all egotistical, that I could serve as a member of the board of directors of that corporation and do good work, and I would have a chemist in whom I had confidence, and if he said, "We need \$100,000 expended here," I would be for it. I would depend upon his judgment, and when I got so I could not depend upon his judgment I would discharge him and get somebody on whom I could depend. I would know the object I wanted to accomplish, and I should try to get the men who were competent to accomplish it.

Mr. MERRILL. That may be true in your individual case, and it is true in other individual cases, but I think one of the greatest dangers in Government operation is the belief that it is a saving of money to get low-priced employees. It is a serious mistake to ignore the competitive phases of personal service. You would not for a moment think of going out and buying a product for Government use and saying that the outside price that you will pay is one-third of the market price, because you know if you do that you will get a product that probably is not worth even one-third as much as the product that you want; but yet we seem to proceed constantly on the basis that we can do that with personal services.

The CHAIRMAN. I don't think it is quite fair to compare personal service with a commodity. I don't believe that is a fair way to judge labor, either.

Mr. MERRILL. I am not classing labor or personal services as a commodity when I insist that the Government can not secure either at one-half to one-third the prevailing rate any more than it can purchase commodities at any such a discount from prevailing prices. The Government, in fact, pays the prevailing rates for labor—when it doesn't pay more—but it has never paid more than a fraction of the prevailing rate in its highest grade technical and administrative positions.

The CHAIRMAN. There is the human element in it that has to be considered. I have observed, in my investigations, for instance, in certain railroads, men have been employed getting as high as \$50,000 a year to manage a railroad, and about the only managing they do is to manipulate finances, issue a lot of bonds, organize some subsidiary companies, and bleed the railroads while they were making millions. A \$50,000 man or a \$7,000 man doing that kind of business would be getting more salary than he ought to have; and a lot of these high-salaried men are doing that kind of thing.

Mr. MERRILL. From my personal observation here in some 8 years that I have been in Washington and 12 years in the Government service, I do not

believe that there is any other one factor that is so much responsible for such inefficiency as exists as the low salaries paid to those in responsible positions.

The CHAIRMAN. I think in lots of cases that is true.

Mr. MERRILL. I have seen hundreds of cases in the last few years, and know of hundreds more, of the best qualified men in the Government service leaving because they could not afford to work at the salaries they were paid, and they could get salaries three or four times as large outside. The result is that the best men leave the service of the Government and the poorest remain.

Now, with respect to the powers that have been proposed to be given to the board here, I have some doubt as to the advisability of granting any power to regulate fertilizer prices of other people, for this would mean that the board would be regulating the prices of its competitors. Particularly, I think it would be undesirable to give them authority to regulate the rates at which any power they might sell should be disposed of by the purchaser. First, it is a matter that is within the functions of the State public utilities commissions; second, if there is no State public utilities commission, then the board is hardly constituted for the quasi judicial action that would be required for the exercise of such regulation. If the board is going to do anything along this line, I think it would be better to place a maximum resale price on the fertilizer ingredients or products purchased from the board.

The CHAIRMAN. I rather think that would be an improvement to it myself. I think you understand the object I had in doing that.

Mr. MERRILL. I understand.

The CHAIRMAN. We want, if we can, to prevent the consumer of fertilizer from being imposed on by a combination or a monopoly, and all those regulations were put in to meet that situation. The suggestion you make I think is a very good one, about controlling the retail price, but I think there ought to be some regulation. Here is something that is brought about by the development of something belonging to the people of the country, and it ought not to be permitted to exist in such condition that, after all, a monopoly might buy all the product and then hold the people up for it. If that were the case we would have accomplished nothing. In other words, the consumer of fertilizers, if we are going into the fertilizer business and making it out of a Government thing, like Government water power, is the man we are trying to protect. The other fellows can protect themselves. The object is to get fertilizer to the consumer at a fair price. Otherwise there is no use going into it. If we stop in the middle and let a middleman buy the Government's supply and then sell it at whatever price he pleases to the consumer, we have not accomplished anything except to give the middleman an opportunity to become a millionaire.

Mr. MERRILL. I think that in order for the board to begin operations it will have to be given an appropriation for working capital.

The CHAIRMAN. I think that is true. It might be given working capital without an appropriation, I think. For instance, I have thought of authorizing it to sell the interest that the Government has in the Gorgas plant, a thing that I think the Government ought to get rid of anyway, and use that as capital, and to permit it to sell power and utilize that as capital.

Mr. MERRILL. I think there are certain obligations that should be placed upon this board. I don't know whether it is necessary to provide it by legislation or not in order to be assured that the procedure will be followed out. I think the board should be required to maintain a system of cost accounts which shall keep full record of all costs of operation, including interest on investment, maintenance, and depreciation, set up so that you will know at all times whether in fact the operations are proceeding at less than cost or at a profit, and so that any essential fact in relation to this transaction can be found out.

The CHAIRMAN. I think that is a good suggestion. I had assumed they would do that anyway, but perhaps it would be a good deal better to put that in the bill.

Mr. MERRILL. It is not the practice in any Government organization—I do not know how it is with those who operate on a quasibusiness basis, like the Shipping Board and others—to keep a system of cost accounting at all. The accounting which is general throughout the bureau organizations is merely an accounting of appropriations and disbursements and is not cost accounting in any sense of the term.

Now, with respect to the investment that the Government has there: The investment in Dam No. 2 at the present time, which will be under the control of the corporation, and all new construction I think should be carried on its books at actual cost. I think it would be only fair, however, with respect to

the nitrate property, that it should be appraised at its reproduction cost less depreciation and carried on the books at that figure, for the simple reason that this is one of the white elephants of war time and many more dollars went in there than would be necessary at the present time to reproduce the plant. I think it should enter on its books interest on the investment at a rate not less than the average rate being paid at the time by the United States on its outstanding bonded debt. I think it should be required in a system of accounting to maintain capital accounts with proper distribution charges between capital and operation.

The CHAIRMAN. What would you do with regard to the maintenance of development work? How would you charge that up—I mean experimental work?

Mr. MERRILL. That is an operating cost of the business.

The CHAIRMAN. Of course, we do not expect to get paid on that. Everybody concedes that there is going to be a necessity to spend a lot of money in experiments for the improvement of the nitrate proposition, and the Government will gain by that in a general way. The Government could afford to expend, and would, in carrying on its work in the Agricultural Department, spend millions of dollars for the purpose of developing a new method and cheapening a method of some particular thing that is in universal use and not think of getting interest on the investment or the money they spent in it. It would not be fair to charge that up and expect this plant to pay interest on it.

Mr. MERRILL. I would not expect the plant to pay a profit in any event.

The CHAIRMAN. No; and I would not either.

Mr. MERRILL. If I went in on this proposition down there, as I said before, it would be primarily as a war insurance, and, secondarily, to get the benefit out of it in peace time by the manufacture of fertilizers. I would do it as cheaply as I could and forget the loss, but I would keep accounts to know how much my loss was.

The CHAIRMAN. Yes; we ought to do that.

Mr. MERRILL. This experimental work I would keep in a separate account, but probably charge it against operating expenses, nevertheless.

There is a provision in the bill for turning over to the United States Army and Navy munitions of war—explosives. Those, under a proper accounting system, should be credited on the books of the company at certainly not less than cost; and if you are to maintain a proper operating capital for the company, it may be necessary also that the War Department or the Navy Department shall transfer on its books to this corporation the price or the cost value of the material transferred.

Those are only details, of course; but the idea that I wish to bring out is this, that if you start out on this basis—start out on the assumption that we will have a system of commercial accounting—it will show at all times what the status of the business is, regardless of whether it shows a loss or a profit.

Now, I think I have nothing more, Mr. Chairman, except merely to repeat that in my judgment the best solution of the whole situation is the retention by the Government of its title in nitrate plant No. 1 and No. 2, the continued maintenance and operation of at least No. 2, and probably of No. 1, as a war insurance and as a means of producing fertilizers in time of peace. If satisfactory arrangements can be made, it would be desirable to lease these properties rather than to operate them by the Government. If such arrangement can not be made, the nitrate properties should be held under an organization such as is proposed in this bill. The nitrate properties should be separated from the hydro properties, with this exception, that whether the Government develops the hydro properties or whether it issues a license to some one else, there should be reserved for the operation of nitrate plant No. 2 the second 600,000,000 kilowatt hours developed at Dam No. 2, and the Government should either sell or lease its steam plant at Gorgas and at nitrate plant No. 2.

The CHAIRMAN. Do you think it would be practical for the Government to retain Dam No. 2 and lease its steam plant at nitrate plant No. 2? They ought to be used in conjunction.

Mr. MERRILL. The steam plant and the hydro plant ought to be used together. If it operates Dam No. 2, it should under such conditions keep the steam plant at Sheffield and dispose of its interest in the steam plant at Gorgas.

The CHAIRMAN. Have you studied the conditions of the Gorgas plant as applied to the ownership of the property in the way that it is intermingled?

Mr. MERRILL. I have not been down there, Mr. Chairman. I can very readily realize what the situation must be with a single power plant, as I understand

believe that there is any other one factor that is so much responsible for such inefficiency as exists as the low salaries paid to those in responsible positions.

The CHAIRMAN. I think in lots of cases that is true.

Mr. MERRILL. I have seen hundreds of cases in the last few years, and know of hundreds more, of the best qualified men in the Government service leaving because they could not afford to work at the salaries they were paid, and they could get salaries three or four times as large outside. The result is that the best men leave the service of the Government and the poorest remain.

Now, with respect to the powers that have been proposed to be given to the board here, I have some doubt as to the advisability of granting any power to regulate fertilizer prices of other people, for this would mean that the board would be regulating the prices of its competitors. Particularly, I think it would be undesirable to give them authority to regulate the rates at which any power they might sell should be disposed of by the purchaser. First, it is a matter that is within the functions of the State public utilities commissions; second, if there is no State public utilities commission, then the board is hardly constituted for the quasi judicial action that would be required for the exercise of such regulation. If the board is going to do anything along this line, I think it would be better to place a maximum resale price on the fertilizer ingredients or products purchased from the board.

The CHAIRMAN. I rather think that would be an improvement to it myself. I think you understand the object I had in doing that.

Mr. MERRILL. I understand.

The CHAIRMAN. We want, if we can, to prevent the consumer of fertilizer from being imposed on by a combination or a monopoly, and all those regulations were put in to meet that situation. The suggestion you make I think is a very good one, about controlling the retail price, but I think there ought to be some regulation. Now, I think I have nothing more, Mr. Chairman, except merely to repeat that in my judgment the best solution of the whole situation is the retention by the Government of its title in nitrate plant No. 1 and No. 2, the continued maintenance and operation of at least No. 2, and probably of No. 1, as a war insurance and as a means of producing fertilizers in time of peace. If satisfactory arrangements can be made. It would be desirable to lease these properties rather than to operate them by the Government. If such arrangement can not be made, the nitrate properties should be held under an organization such as is proposed in this bill. The nitrate properties should be separated from the hydro properties, with this exception, that whether the Government develops the hydro properties or whether it issues a license to some one else, there should be reserved for the operation of nitrate plant No. 2 the second 600,000,000 kilowatt hours developed at Dam No. 2, and the Government should either sell or lease its steam plant at Gorgas and at nitrate plant No. 2.

The CHAIRMAN. Do you think it would be practical for the Government to retain Dam No. 2 and lease its steam plant at nitrate plant No. 2? They ought to be used in conjunction.

Mr. MERRILL. The steam plant and the hydro plant ought to be used together. If it operates Dam No. 2, it should under such conditions keep the steam plant at Sheffield and dispose of its interest in the steam plant at Gorgas.

The CHAIRMAN. Have you studied the conditions of the Gorgas plant as applied to the ownership of the property in the way that it is intermingled?

Mr. MERRILL. I have not been down there, Mr. Chairman. I can very readily realize what the situation must be with a single power plant, as I understand

it, with two units sitting side by side on separate foundations, supplied with steam from the same boiler, connected with the same switchboard, part of the same plant, and I do not believe that they could be separated without wrecking or scrapping the property that was taken away.

The CHAIRMAN. They never could be operated separately except on some kind of an agreement.

Mr. MERRILL. That is it.

The CHAIRMAN. In other words, they would be as difficult to separate as the Siamese twins.

Mr. MERRILL. Only with this difference, that when you separate the Siamese Twins they both die, and if you separate these twins only one will die.

The CHAIRMAN. It depends on how you separate them. If you separate them by taking one away, you have lost one entirely.

Mr. MERRILL. Yes.

The CHAIRMAN. And you may separate them by taking them both away, and in that case they would both die.

Mr. MERRILL. Yes. But it would seem to me that it is utterly impracticable to dispose of the Government's interest in the Gorgas steam plant to anybody except the Alabama Power Co.

The CHAIRMAN. It would seem that the Government ought to buy their interest or they ought to buy the Government's. I don't see any reason why the Government should buy theirs, because we have not now any particular use for that plant.

Mr. MERRILL. My understanding of the purpose of the contract, in the first place, was not to give the Alabama Power Co. a strangle hold on the Government's investment, but to get a grip on the Alabama Power Co. whereby it would pay a reasonable price for the properties that the Government did not want, so that instead of going on and disposing of war property as they have hundreds of times at from 5 to 10 or 15 per cent of the investment, this is a case of getting back the actual value of the investment.

The CHAIRMAN. How much have we invested in the Gorgas plant?

Major BURNS. At Gorgas we have invested about \$4,000,000. In the transmission line connecting Gorgas with Muscle Shoals we have property that has cost an additional million dollars.

The CHAIRMAN. We have about \$5,000,000 invested.

Major BURNS. With the Alabama Power Co.; yes.

The CHAIRMAN. That includes the power plant and everything?

Major BURNS. Everything; yes, sir.

Mr. MERRILL. In most cases where the Government has had property, it has had to dispose of it at scrap prices, and on that basis this would be about a hundred thousand dollars, but here is a situation where they certainly can get more than scrap value for the property.

Senator KEYES. Have we not an offer of \$2,500,000?

The CHAIRMAN. We have an offer of \$2,500,000, made to the Secretary of War, which he transmitted to us.

Mr. MERRILL. That is all I have to say.

The CHAIRMAN. Have you any questions, Senator Keyes?

Senator KEYES. No.

The CHAIRMAN. We are very much obliged to you. I have been very much interested in your suggestions.

Senator KEYES. I am going to suggest that it may be important to change Section VIII so as to include steam power as well as power developed by the dam, because it seems to me if you are going to sell power it will be connected up and operated as one entire power plant.

The CHAIRMAN. That is a good suggestion.

Senator KEYES. I should think you would want to provide so that it would include all the power.

The CHAIRMAN. The Secretary of Agriculture is working on some amendments that he wants to suggest. When he gets them ready I will call the committee together. No doubt there will be a great many amendments, some that I want to suggest myself, and we may think of a great many more before we get through.

(Whereupon at 12.25 o'clock p. m. the committee adjourned to 10.30 o'clock a. m., Tuesday, June 6, 1922.)

MUSCLE SHOALS.

THURSDAY, JUNE 8, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris (chairman), Capper, Keyes, Ladd, Kendrick, and Heflin.

STATEMENT OF DR. WALTER GLAESER.

The CHAIRMAN. State your name and occupation for the record.

Doctor GLAESER. Walter Glaeser, general manager and vice president of the M. C. S. Chemical Corporation, 63 Paris Street, Newark, N. J.

The CHAIRMAN. What is the business of that corporation?

Doctor GLAESER. We are manufacturers of chemicals—pharmaceutical and technical chemicals.

The CHAIRMAN. How many factories have you?

Doctor GLAESER. We just have one.

The CHAIRMAN. Where is that located?

Doctor GLAESER. At 63 Paris Street, Newark, N. J.

The CHAIRMAN. What is the value of your outfit?

Doctor GLAESER. Well, I suppose about \$100,000.

The CHAIRMAN. Have you made a study of the Muscle Shoals proposition?

Doctor GLAESER. Well, no, except what I have read in the papers and what I have had reported to me by my friends.

The CHAIRMAN. You desire to testify particularly, I presume, about the nitrate plant there?

Doctor GLAESER. No, sir. About utilizing the electric power at Muscle Shoals for the production of commercial fertilizers.

The CHAIRMAN. Oh, yes. We will be very glad to hear you now on that subject.

Doctor GLAESER. Well, I presume that I will have to tell you about the process that I have.

The CHAIRMAN. Yes. Go ahead in your own way.

Doctor GLAESER. May I read from a memorandum I have prepared?

The CHAIRMAN. Yes.

Doctor GLAESER. I'll give an introduction to lead up to what I have to say. This is leading up to the proposed project. Is it all right to read it?

The CHAIRMAN. Yes, sir. I don't want to interfere with you in any way. Just proceed in your own way.

Doctor GLAESER. The first Stassfurt potassium chloride was brought on the market in 1861 and replaced first the chloride of potash made from kelp. The manufacture of the latter was kept up by considerably increased selling prices of iodine. Experiments conducted with a view to obtain chloride of potash from the ocean were discontinued; so were all attempts to devise methods for the extraction of potash from feldspar. The Indian potash saltpeter was almost entirely eliminated from European markets, since it could not compete with the artificial potash saltpeter made from Chili saltpeter and Stassfurt potassium chloride by double decomposition.

Treated according to Leblanc's soda process, potassium chloride can easily be changed to potassium carbonate. This artificial carbonate of potash has, however, not yet succeeded in replacing entirely the natural carbonate made from the ash of plants, the ignition residue from beet-root molasses, and the potash obtained from the sweat of sheep's wool. The consumption of carbonate of potash increases daily. Potash soaps and potash glass are again valued. Potassium carbonate, made from muriate of potash, forms the raw material for a large number of technically important potash salts. The principal importance of all potash salts, lies, however, in their extraordinary value as artificial fertilizers.

As Liebig pointed out, the plant needs potash as an absolutely necessary and essential foodstuff. The fertilization with potash salts has proved of great advantage in most of the civilized countries, not only for cotton, tobacco, potatoes, but also for orchards, grain, corn, grasses, and the lesser agricultural crops. The consumption of potash salts in this country, during the last 10 years before the war, reached enormous proportions. Here most of the potash is used in the fertilizer industry, and practically all of the potash salts necessary are imported from Germany, which country exercises a monopoly, fixing outputs, prices, etc. Competition with Germany has so far been out of the question, and will be until a cheap process is devised for the commercial exploitation of the vast stores of insoluble potash locked up in feldspars and similar silicates. This can only be accomplished by means of a proper by-product which must have a considerable value itself, and in this way indirectly pay for the cost of extraction.

There exist to-day in the United States and Canada several rather unimportant sources of soluble potash salts and potash manufacturing establishments. The disappearance of our forests has greatly curtailed the production of potash from the ashes of wood. In Canada the carbonate of potash has been manufactured extensively, since that country abounds in forests. However, during the last 50 years a great falling off in the manufacture of the so-called "pearlash," has taken place. Scattered deposits of potash salts, on a diminutive scale, are said to have been located in California on Government land. The necessary litigation is pending to allow proceeding with the exploitation of these deposits.

A small amount of potassium chloride is obtained from kelp, a seaweed, on the Pacific coast. Cost of production must be extremely high and can be offset in normal times only by by-products, like iodine. Several saline deposits in the region of Great Salt Lake, Owens Lake, and Searles Lake Basins are being investigated for potash production on a commercial scale, but up to this time no commercial process has been discovered. The saline lakes in Nebraska are now being utilized, and, by concentration, potash salts are being obtained, but the product is low in K_2O content, and to produce a product comparable with the German muriate would not be practical. An extensive alunite deposit—impure basic potash alum—is being experimentally worked by a company with large capital. They seem to be making good progress, but it is doubtful if they will be able to compete with the German syndicate. A short time ago prospectors in the eastern part of California found small deposits of potash, alum, and sulphur. It is said that a company was formed to develop that tract of land. And so it goes on. The search for potash deposits continues in the West, and some day may be crowned with success, after millions of dollars have been spent in borings.

There are potash deposits in the United States if only some one would spend the necessary money to find them, because there are saline wells in Michigan and Texas and all over the Middle West, which carry more or less potash. These saline wells come from a potash deposit, you know. Where the deposit is we do not know, unless some one spends some money to find out.

THE CHAIRMAN. You mean these saline wells indicate that there is a source of potash?

DOCTOR GLAESER. Yes. There are perhaps just as large potash deposits in this country as there are in Germany. The question is, Where are they? They are here. Practically every brine carries potash in water-soluble form, and these brines are flowing through some potash salt deposits somewhere. They may be a mile below the surface or they may be 5 miles away, so far as we know.

THE CHAIRMAN. You mean that wherever there is one of these saline wells carrying small amounts of potash in solution it indicates that somewhere near the source where it flows through there is potash?

DOCTOR GLAESER. Yes, sir.

THE CHAIRMAN. In probably large quantities?

Doctor GLAESER. Yes; exactly so. In the meantime, even the smallest quantity of potash salts produced from the above sources in this country may act as a check on the German syndicate.

A comparatively small amount of soluble potash salts is collected from the flue dust of cement plants and blast furnaces. The machinery required is very expensive, calling for the installation of a Cottrell precipitator; this apparatus produces an electrostatic field which the flue dust traverses, the potash being precipitated on one of the poles. The precipitator is very efficient, but expensive to install and to operate, but at present prices for potash salts no doubt the investment will pay for itself. The Cottrell apparatus is in successful operation at Riverside, Calif., and at a cement plant located at Hakerstown, Md., and one near Easton, Pa.

Soundings in search of potash salts have been conducted in the Province of Belfort, France, but so far no results have been attained. Potash has been discovered in the thick layer of ashes covering the ruins of Herculaneum and Pompeii, and conclusion was drawn that the neighborhood around Vesuvius is rich in potash. On the border between Austria and Russia efforts are being made to exploit commercially the potash deposits appearing there as a by-product of the Galician salt industry; but it is somewhat premature to consider this as a possible competitor of the Stassfurt mines, even if they should prove a paying proposition. Of more importance in that respect are the discoveries of deposits of chloride and sulphate of potash in Catalonia, in Spain; but, naturally, their true value can only be estimated after a thorough practical investigation.

Both in this country and in Europe small amounts of potassium chloride and sulphate, respectively, are also derived from waste liquors of certain chemical plants and from sea water (Geddes, N. Y.). The amount is very insignificant, and is mentioned only as a matter of record.

On looking over the situation, as described above, critically, we must frankly admit that although some potash is actually being produced in this country and elsewhere, outside of the product of the Stassfurt mines the amounts produced are so small, and always will be, considering the nature of the raw materials employed and their comparatively limited supply, that at present all these various projects of obtaining potash and the numerous small enterprises actually producing potash from insignificant sources of raw materials can hardly be of any importance when compared with the enormous and much less costly production of the German mines, and the rate at which, especially, the United States consumes these potash salts. Very often, in spite of the gigantic German output, the demand in the United States for potash salts for agricultural purposes surpasses the supply, and therefore the German syndicate manifests no nervousness whatever in the presence of attempted competition, especially the competition which arose during war time, and confidently expects to continue dictating the prices to the rest of the world.

American farmers have asked themselves often enough, "What will we do if the supply of German potash salts, so essential to our prosperity and therefore to the prosperity of our country, is shut off, by a war, for instance?" This condition existed lately, and the United States was forced to pay exorbitant prices for a material which is needed so badly for her own commercial and agricultural development.

Waste water from chemical plants like tartaric-acid factories, you know, carry potassium sulphate or chloride. These plants produce tartaric acid from argol. Argol has a good deal of potash in it. In order to decompose the potash you have to change the argol into tartrate of lime, which is done by treating the argol with calcium chloride, forming tartrate of lime and potassium chloride. The tartrate of lime is then decomposed with sulphuric acid, producing sulphate of lime and tartaric acid. The potassium chloride from the mother liquor of the tartrate of lime is allowed to run into the sewer. There is a great deal of waste of potassium sulphate.

Senator KENDRICK. Mr. Chairman, may I ask the witness a question there?

The CHAIRMAN. He has not said whether he wanted to be interrupted while reading this prefatory explanation.

Doctor GLAESER. Yes, sir.

Senator KENDRICK. I want to ask if you have the figures as to the difference in the cost of potash in this country during ordinary times and the price we paid during the war.

Doctor GLAESER. Yes, sir. I will get you that right away.

Senator KENDRICK. All right.

Doctor GLAESER. But relief is in sight. The natural resources of this country are wonderful. Of course, it is necessary to know how to use them to best advantage. The United States abounds in feldspar and feldspathic rocks, and these minerals are widely distributed throughout the country. The State of Connecticut ranks first in the list of feldspar-producing States; Pennsylvania is second; then comes Maine, New York, Maryland, Massachusetts, Wisconsin, Virginia, Texas, North Carolina, Georgia, Minnesota, etc. These rocks have, among other constituents, a considerable percentage of potash; they are, therefore, a source of raw material from which potash can be extracted; and after a method has been devised, which will produce potash from these rocks in commercial quantities, and at an operating cost low enough to compete with the German product after the war, then these feldspathic rocks will form the main source of potash in this country. Liebig stated that in order to benefit the plants the potash must be applied in water-soluble form. The question arose, "Has finely powdered feldspar any value as a potash fertilizer?" The answer is "No." Numerous experiments were conducted by scientists all over the world, from the middle of the last century until this day, to test the availability of finely pulverized feldspathic rock, and to ascertain whether it would serve as plant food and potash conveyor. The experiments made by the United States Agricultural Department proved fertilization with ground rock alone a failure. Detailed experiments performed by the celebrated German chemist, Doctor Maercker, showed also, conclusively, that ground feldspar and feldspathic rocks were absolutely useless as fertilizers. While a slight percentage of their potash contents is ultimately rendered available to plant life by the action of nitric acid, ammonium bicarbonate, and the acids of the soil, the process is entirely too slow to benefit a given crop.

Methods for extracting potash from feldspar were suggested over 70 years ago by German, English, and French chemists, whose experiments were abandoned in undeveloped stages at the time of the Stassfurt discoveries. However, later, after the formation of the German potash monopoly, interest in the problem of procuring potash from feldspars was reawakened, as is proved by the great number of patented processes for the utilization of potash-carrying feldspathic rocks. Most of these methods are of little or no commercial importance. Some of them may show promising results in the laboratory scale, but until the disassociation of potash feldspar can be successfully applied on a commercial scale we have very slight prospects of freeing ourselves from the yoke of the German potash monopoly.

German commercial muriate of potash, with 50 per cent K_2O , was sold before the war for about \$40 per short ton, laid down at the Atlantic seaboard. One unit of K_2O (corresponding to 20 pounds K_2O) in form of chloride cost the American consumer approximately 80 cents at shipping points along the eastern coast.

Two years ago—in 1915—it was stated by American scientists, who had made a special study of the potash situation (American Fertilizer, Oct., 1915), that that feldspar extraction process will be commercial which can produce, in time of peace, one unit of K_2O in form of chloride at less than 60 cents. That assumption may have been correct at that time. To-day, considering the changed political conditions, this cost figure seems entirely too high; it should be about 48 cents, or even lower, for the simple reason that should Germany reduce the price of muriate from \$40 to \$30 per ton, which she can easily do, as the Stassfurt mines are not working at full capacity, all processes based on an operating cost of 60 cents per unit will have to be discontinued; whereas at 48 cents per unit, or a manufacturing cost of \$24 per ton of American-made commercial muriate, there remains enough margin to warrant competition.

At this stage another possibility may arise: In case of serious competition affecting her potash interests Germany, after the war, will undoubtedly try to reestablish her monopoly on potash salts by the simple expedient of dropping the price of the commercial muriate to, let us assume, \$15 per ton, or 30 cents per unit of water-soluble K_2O . At this figure the German syndicate would not make any money, for the cost per unit of water-soluble K_2O in crude carnallite, which is one of the materials used, before the war was approximately 18 cents at the time. More than 6 tons of crude carnallite must be worked in order to furnish 1 ton of the commercial muriate; the cost of producing the concentrated article is high, and there is a loss of 15 to 25 per cent of potassium chloride in the operation.

While the chances for a price reduction of the German commercial muriate to \$15 per ton after the war are remote, the possibility exists nevertheless and should here be given due consideration.

It follows that the commercial feasibility of a process for the extraction of potash from feldspar is determined by these seven main factors:

1. The plant must be in close proximity to a large, fair-grade feldspar deposit.
2. The deposit should be near rail and water and situated in one of the agricultural States or near the agricultural belt.
3. The process must provide for continuous operation.
4. A large amount of feldspar must be treated daily.
5. A high percentage of the insoluble potash must be changed to the water-soluble state; that is, 90 per cent or more.

Most extraction processes never get more than 50 per cent.

6. The process must be devised so that a high-grade and valuable by-product is obtained, which will pay for the cost of treatment.

7. The operating cost per unit of water-soluble K_2O must be less than 30 cents.

Any process operating at a higher cost than 30 cents per unit of K_2O might just as well be discarded.

None of the processes classified below fulfill all of these seven requirements. They may be arranged in four groups, as follows:

1. Methods requiring treatment in autoclaves under high pressure. The operation is necessarily noncontinuous, and not only a small amount of spar can be handled daily. Machinery required is very expensive. Cost figures for heating and evaporation of a large volume of dilute liquors, as well as depreciation of apparatus, must be very high. These processes are not commercial, even assuming the decomposition of the feldspar to be complete, as a by-product; a cement material is obtained which has no special value.

2. Volatilization processes with cement material as a by-product. Material is sent through kilns where the conversion of the insoluble potash to the water-soluble state is said to take place. Most of the inventors claim to obtain an extraction of 80 per cent. The potassium chloride is volatilized and caught in the dust chamber and so-called stack washer.

If a chloride is used as a reagent, as indicated in the various patent papers, an extraction of 80 per cent as claimed is out of the question, for certain chemical reasons. If any extraction at all is obtained, it will be nearer 40 to 60 per cent.

The volatilization of the potassium chloride can not be complete, as this salt starts to volatilize around $900^{\circ} C.$, and the temperature must be raised to about $1,600^{\circ} C.$ before all potassium chloride is driven off. This means maintaining a temperature of nearly $3,000^{\circ} F.$ in kiln, and to keep the goods at that temperature a sufficiently long time to insure volatilization of all potassium chloride which has been liberated. The by-product, cement material, is of doubtful value.

3. More or less complicated burning or fusion processes with cement material as a by-product. There are a large number of these processes, all of which work along the same lines. The feldspar is usually subjected to a preliminary heat treatment, either with or without the addition of chemicals. It is then in a condition to be mixed with other reagents, and the mixture is furnaceed in kilns at high heat. None of these methods will give a high extraction, especially if a chloride is employed as the reagent, although one or two of the inventors claim to have obtained as high as 80 per cent extraction.

Then follows leaching with water or acids, or treatment with the electric current, etc., and finally evaporation. The only by-product obtained is a material fit for cement clinker, paper filler, or road material, having no fixed commercial value.

4. Electrolytic processes and methods based on the use of very expensive chemicals, like hydrofluoric acid, etc. These processes have only scientific value. Of European scientists who have made an exhaustive study of the decomposition of the feldspars, special mention may be made of R. A. Tilgham (1847); W. E. Newton (1856); F. O. Ward (1857); the German chemist, Dr. Dulla; J. G. A. Rhodin (1901); the Norwegian chemists, O. N. Witt and G. Jebson (1909); and the Swedish chemist, O. Ashar (1911), who was assisted by L. Lokka, E. A. Lahenius, and E. Makinen.

Various reagents were employed by these inventors to effect the decomposition. Most of them used lime or salt, or mixtures of lime and salt. Ashar experimented with calcium chloride also and found that "acids do not seem

to be suitable for the decomposition of feldspar. Of the other methods, only the one with calcium chloride and with lime and salt are worthy of attention, the former offering distinct advantages if calcium chloride be obtainable at a cheap rate."

Some promising results were obtained with the lime-salt method, so that the establishment of a factory in Sweden was contemplated—1901—with the main object of making the vast deposits of third-rate feldspar in the neighborhood of Stockholm useful for agricultural purposes, without giving any special attention to the production of a high-grade by-product.

Cost figures are available of only two of the processes discussed, and even these figures are largely based on assumption. They are much too high, anyway. One claims his operating cost per unit of water-soluble K_2O to be 39 and 61 cents; and the prospectus arranged by the promoters of the other process shows a trifle over 71 cents cost of producing one unit of water-soluble potash. Both inventors state that they will obtain an uninterrupted extraction of 80 per cent, and their cost figures are, of course, based on that assumption. Even if they did obtain that degree of efficiency of decomposition, their operating cost per unit, as pointed out before, is much too high to allow of successful competition with the German salts. As a matter of fact, since both employ lime and calcium chloride as reagents and carry the furnacing operation out in an open kiln and a blast furnace, respectively, it can be safely stated that it will be very difficult to obtain an uninterrupted extraction of 80 per cent, as claimed.

In summing up, it can be asserted with a fair degree of accuracy—the opinion being wholly unbiased—that none of the processes for the decomposition of feldspathic rocks, upon subjection to a critical examination as to their commercial usefulness, have shown their ability to enter into successful competition with the products from the German potash mines in normal times. The main reasons for their incompleteness or inefficiency, judged from the standpoint of commercial rivalry, are their high operating costs, low degree of extraction, and lack of a valuable by-product.

The process was devised with the idea of obtaining a valuable by-product which would pay for the total cost of operation. The experiments toward the perfection of a process lasted more than three years and were conducted successfully at three experimental plants, located at Naval Academy Junction, Md., Toledo, Ohio, and Fullerton, near Allentown, Pa. While the first two plants were erected only for the purpose of trying out on a comparatively large scale the reactions obtained in the laboratory in batches of several hundred pounds, the experimental plant at Fullerton was of semicommercial size, designed for the treatment of tons of material in a continuous operation. The extraction exceeded 80 per cent.

The process consisted of two parts, namely, the furnace treatment and the chemical part for the production of the by-product.

Calcium chloride is used as reagent in both parts, with or without the addition of a small amount of a suitable catalytic agent. In the first part of the process both oxygen and water steam are excluded, while in the second part the addition of water steam, in the absence of oxygen, plays an important rôle.

A large excess of calcium chloride is used at the beginning. All of this calcium chloride is regenerated with the exception of that amount which was consumed during the conversion of the insoluble potash to the water-soluble state.

All heat treatments are applied in specially constructed furnaces. The other apparatus needed is standard and, relatively, inexpensive. The steps of the process as worked out are as follows:

1. Liberation of the K_2O .
2. Separation of the potassium chloride from the excess calcium chloride by "steaming."
3. Formation of an amount of hydrochloric acid corresponding to the excess calcium chloride which was present in the mass to be "steamed."
4. Collection of the hydrochloric-acid gas evolved.
5. Utilization of the collected hydrochloric acid in the decomposition of an equivalent amount of phosphate rock.
6. Precipitation of dicalcium phosphate, or superphosphate (which is soluble in ammonium citrate solution) from the phosphoric acid liquor obtained).

7. Reclamation of calcium chloride from the mother liquor of the dicalcium phosphate, the amount of calcium chloride regained being equivalent to the amount of this reagent contained in the mass to be steamed (see No. 3).

The feldspar-calcium chloride mixture—after receiving an inexpensive preliminary treatment—is sent through a specially equipped furnace, at such a rates of speed that the material will stay in the extreme hot zone about one hour. In this way an uninterrupted conversion of the insoluble potash to the water-soluble state is obtained. The material leaving the furnace is now reduced to a uniformly granular mass and fed into another special furnace, where it receives a second heat treatment at a temperature much lower than before, steam being blown into the furnace at the discharge end. Water may be introduced in form of a fine spray at this stage. By this treatment nearly all the calcium chloride present can be decomposed to lime and hydrochloric acid. The hydrochloric acid gas leaving this "steamer" is caught in a tower and a set of tourrills. The dilute hydrochloric acid obtained is used in the manufacture of citrate-soluble dicalcium phosphate (see note), while an equivalent amount of calcium chloride is regained, which is used over again.

The whole operation forms a complete circle as the following diagram indicates.

Here is a diagram. Here is a mixer, a dryer, first furnace, second furnace, acid tower, phosphate rock dissolving tank, superphosphate precipitating tank, then comes the evaporator. After taking out the muriate of potash and superphosphate, you have the calcium chloride to put back into the mixer and use over again.

Products obtained:

1. A commercial muriate of potash with 50-58 per cent K_2O , the 50 per cent goods having as impurity about 16 per cent sodium chloride and from one-fourth to 3 per cent calcium chloride. The amount of sodium chloride in the finished muriate depends upon the per centage of soda (Na_2O) in the spar used.

2. A superphosphate having from 40 to 52 per cent available phosphoric acid, the higher grade being theoretically dry.

3. A residue of a fineness to pass through a 120-mesh sieve and having a chemical composition similar to that of cement rock. This material has no fixed value.

NOTE.—The modern view of the alimentation of plant is based on Liebig's fertilizing theory, which is founded on the principles that the plant foods, either of an organic or a mineral nature, must be supplied in an available form to serve as nourishment for plant life. This means they must be in such form as to be readily assimilated by the crop to which they are supplied.

The principal elements for the growth of plants are potassium, nitrogen, and phosphorus. Potassium is that constituent which is essential for the formation of starch within the seed or the kernel of the fruit of the crop. Nitrogen promotes and regulates the growth of plants. Phosphorus is of the utmost importance for the ripening process and is found in largest quantity in the seeds and fruits. Lacking phosphorus, plants will have frail stalks. Lacking potassium (starch) and phosphorus (strength), the plant fruits (the crop) will be imperfect, small, and the yield will be light. Lacking nitrogen, the leaves of the plant will be "off color" and the growth will be stunted.

As soon as a crop is removed the soil is depleted of these important elements, which therefore must be replaced by artificial means in an available form. Potassium is readily assimilated only if it is introduced in water-soluble form, as a salt of potassium, like muriate, or sulphate, or carbonate of potash. Nitrogen may be supplied as water-soluble nitrate or as water-insoluble organic nitrogen (tankage, blood, fish, etc.). Phosphorus is applied in any of the following, either water-soluble or available, forms:

1. As acid phosphate, with 13 to 16 per cent available phosphoric acid, 80 per cent of which is water-soluble. This product is obtained by the action of sulphuric acid upon phosphate rock. About 2,000,000 tons of phosphate rock are used annually in this country in the manufacture of acid phosphate.

2. As double superphosphate, resulting from the action of phosphoric acid upon finely ground phosphate rock. This material is imported from Europe and contains about 40 per cent of phosphoric acid, which is either in the water-soluble or available state. It is used in the United States only to a limited extent.

3. As a concentrate "available" superphosphate or in the form of an electrolytically (Dr. W. Palmer, Norway) made, so-called diphosphate, having from

22 to 23 per cent phosphoric acid, all of which is water-insoluble, but is soluble in standard ammonium citrate solution. This material is also imported from Europe.

4. As phosphatic slag, like the so-called Thomas slag, a by-product of the Bessemer steel process, carrying 17 to 18 per cent of phosphoric acid, practically in form of tetracalcium phosphate. The phosphoric acid in this material is insoluble in water but gradually soluble in standard ammonium citrate solution. It must be ground very fine.

The degree of availability is practically the same whether acid phosphate, double superphosphate, or available superphosphate be employed. Experiments have indicated that the phosphoric acid or water-soluble phosphates is first converted to the "available" or reverted form as soon as it comes in contact with the bases of the soil, the juices eliminated by the plant roots afterwards dissolving this finely divided water-insoluble phosphate. It is different with phosphatic slag. This material is assimilated by plants very slowly, as its phosphoric acid is present in a comparatively insoluble form; nevertheless it is superior to untreated ground phosphate rock.

Over 4,000,000 tons of phosphatic material are consumed annually in the United States. This demand is steadily increasing with the agricultural development of this country. In fact, the agricultural development is dependent upon the amount of phosphates employed in the cultivation of the land.

Cost of producing one unit of available phosphoric acid, before the war, was in the neighborhood of 50 cents, with a selling price of more than 70 cents.

The dicalcium phosphate, produced under the proposed process, is obtained as a by-product. Its cost of manufacture is very low. There is a steadily increasing, enormous demand in the United States for a high-grade available phosphatic material. For this reason the advantage is readily seen of obtaining a high-grade "available phosphate" as by-product in a feldspar extraction process.

Cost of plant: The process is arranged so that it can be worked on a very large scale in a plant composed of units, each unit capable of taking care of 50 tons of feldspar per day.

While the cost of the 1-unit plant will be comparatively high, that of a 10-unit plant will be much lower in proportion. It is estimated by a reliable engineering company that the complete equipment, including buildings, for the first unit, would cost about \$350,000, and that a 10-unit plant, capable of handling 500 tons of feldspar and approximately 400 tons of phosphate rock per day could be put in shape for operation at an expenditure of approximately \$1,013,000; a "one-half unit" plant, not so complete in equipment as the one-unit plant, but giving continuous operation, approximately \$135,000.

The estimates, of course, assume that the plant be erected in close proximity to a large feldspar deposit which must have railroad connection, and a tide-water location would be of great advantage.

The daily continuous production in a completely equipped 1-unit plant, as outlined above will be at least 9 tons of commercial chloride of potash, 50 per cent K_2O ; 32½ tons of superphosphate, with 40 per cent available phosphoric acid, and 60 tons of cement material, of no fixed value. Total daily operating cost will not exceed \$554.

This has been worked out very closely by the Fuller Engineering Co. of Allentown, Pa., a reliable concern, based on actual tests.

Value of 9 tons of commercial chloride of potash with 50 per cent K_2O , before the war	
Value of 32½ tons of superphosphate with 40 per cent available phosphoric acid	\$360
	910
Total value of manufactured products at basis 1 unit water-soluble K_2O , 80 cents; 1 unit available P_2O_5 , 70 cents)	1,270
Maximum total daily operation cost	544
Total daily profit at pre-war prices	726
Cost and earning in a one-half unit plant will be as follows:	
Value of products obtained, based on peace prices	\$635
Daily operating cost	342
Daily profit at pre-war prices	293

In a 10-unit plant the net earnings are shown in the following manner:

Value of products obtained, at pre-war prices.....	\$12, 700
Daily operating cost.....	5, 340
Daily profit at pre-war prices.....	7, 360

It is readily seen that the potassium chloride obtained is free from any manufacturing cost, as the value of the superphosphate produced exceeds the combined cost of operation. It does not cost a cent in this combined process of operation. The value of the superphosphate obtained is \$910 in a one-unit plant, and the total cost of operation is only \$554, which makes the potassium chloride not only free from cost but introduces an additional profit of over \$350.

This is still true should the selling price of available phosphoric acid drop to 42 cents per unit, although such a contingency seems remote. The potash would still be obtained free of cost if the value of the acid phosphate is 43 cents per unit.

It was stated before that in the determination of the commercial feasibility of a process for the extraction of potash from feldspar seven main factors had to be considered. The proposed process meets all these requirements in the following manner:

1. "The plant must be in close proximity to a large fair-grade feldspar deposit."

There are several large feldspar deposits right near Muscle Shoals.

2. "The deposit must be near rail and water and should be situated in one of the agricultural States or near the agricultural belts."

Several high-grade deposits of feldspar and other potash-carrying silicates are to be found in the southern part of the United States adjacent to rail and water.

3. "The process must provide for continuous operation."

The operation of the proposed process will be a continuous one.

4. "A large amount of feldspar must be treated daily."

The complete plant, as outlined, consists of 10 units, each unit capable of taking care of 50 tons of feldspar per day. The maximum daily capacity of the proposed plant will therefore be 500 tons of feldspar. If desired, this may be increased to 20 units or more on account of the vast extent of the deposit of feldspar, mica, sericite in the south locality.

5. "A high percentage of the insoluble potash must be changed to the water-soluble state; that is, 90 per cent or more."

Treated according to the proposed process, an uninterrupted conversion of more than 90 per cent of the insoluble potash to the water-soluble state is obtained.

These figures you can have verified at any time if you will ask Dr. Edward C. Worden, of Milburn, N. J., and Mr. J. B. Gaffney, of Allentown, Pa., to come here as witnesses. They can verify these statements.

6. "The process must be devised so that a high-grade and valuable by-product is obtained which will pay for the cost of treatment."

Dicalcium phosphate (superphosphate, with more than 40 per cent available P_2O_5) is the by-product obtained. All the phosphoric acid contained in that material is present in the available state, which means soluble in ammonium citrate solution of standard strength.

7. "The operating cost per unit of water soluble K_2O must be less than 30 cents."

The value of the superphosphate obtained covers not only the complete cost of manufacturing the potash as potassium chloride but in addition leaves a considerable surplus over the combined manufacturing costs.

The proposed process is therefore commercially feasible and capable of entering into successful competition with the German potash syndicate at any time.

The CHAIRMAN. You say the process you have outlined is covered by 14 patents. Who owns the patents?

Doctor GLAESER. The Potash Extraction Corporation of New York owns the patents.

The CHAIRMAN. They are all owned in this country, are they?

Doctor GLAESER. Yes; they are all owned in this country. They are all taken out here.

The CHAIRMAN. Are they new patents?

Doctor GLAESER. Comparatively new. The oldest is about 4 years old. Some of them are still pending. I am keeping them at the Patent Office as long as I can.

The CHAIRMAN. Do you expect to manufacture by that process?

Doctor GLAESER. Not very quickly.

The CHAIRMAN. Why?

Doctor GLAESER. I want first to cast around a little bit to find out if some one would be interested in taking it up.

The CHAIRMAN. Does it require much power?

Doctor GLAESER. No; it does not take much power. It requires heat.

The CHAIRMAN. You need electricity?

Doctor GLAESER. It requires a lot of heat.

The CHAIRMAN. And you want to do that by electricity?

Doctor GLAESER. Yes, sir.

The CHAIRMAN. Have you examined the nitrate plant down there at Muscle Shoals?

Doctor GLAESER. No. I know only about this from newspaper reports and from statements of my friends.

The CHAIRMAN. You provide the potash?

Doctor GLAESER. I provide the potash and superphosphate, and somebody else provides the nitrogen.

The CHAIRMAN. It was your idea to operate this in connection with the extraction of nitrogen preferably by the plant down at Muscle Shoals?

Doctor GLAESER. Yes.

The CHAIRMAN. To combine the two?

Doctor GLAESER. Yes; and make a complete fertilizer.

The CHAIRMAN. And make a complete fertilizer?

Doctor GLAESER. Yes; and get your potash practically free and your acid phosphate much lower than it can be manufactured for in the usual way.

The CHAIRMAN. In making a complete fertilizer you have to get the nitrogen from the air, in the process down there?

Doctor GLAESER. Yes, sir.

The CHAIRMAN. You would then get the potash without cost?

Doctor GLAESER. Yes.

The CHAIRMAN. And the phosphate at less than present cost?

Doctor GLAESER. Yes; exactly.

The CHAIRMAN. Your by-products will be sold on the market?

Doctor GLAESER. Well, the by-products—there are not any other by-products to speak of.

The CHAIRMAN. How do you get your potash for nothing, then?

Doctor GLAESER. I stated that you assume the acid phosphate would be the main product. The by-product is a cement material, having no fixed value.

The CHAIRMAN. You would be manufacturing phosphates?

Doctor GLAESER. Yes.

The CHAIRMAN. And your potash would result as a by-product?

Doctor GLAESER. Yes. Either potash with acid phosphate as the by-product, or acid phosphate with potash as the by-product.

The CHAIRMAN. The expense, now, as I understand it, of making the phosphate would be considerably less than what it costs under present conditions to get phosphate?

Doctor GLAESER. Yes.

The CHAIRMAN. The potash entering into your fertilizer would not cost anything if you charged the cost all off to the acid phosphate?

Doctor GLAESER. Yes, sir.

The CHAIRMAN. Have you computed what it would cost in the nitrate plant down there to get the nitrogen to be able to produce complete fertilizer?

Doctor GLAESER. I have not, because I do not know the operating cost for producing that.

The CHAIRMAN. How much power would it take, if we put in 10 units, 500 tons daily capacity?

Doctor GLAESER. I don't know, but it can be easily figured out by a mechanical engineer, if he knows that the heat treatment takes one hour at 1,500 degrees Fahrenheit.

The CHAIRMAN. Your cost would depend on what your power costs, would it not, to produce the heat?

Doctor GLAESER. Oh, yes.

CHAIRMAN. How can you give us those figures until you know what your's going to cost?

Doctor GLAESER. We had this figured out by the Fuller Engineering Co.

The CHAIRMAN. Well, do you know what their power costs them?

Doctor GLAESER. Yes.

The CHAIRMAN. How much?

Doctor GLAESER. You can get that statement from Mr. Gaffney. He made the calculations under the supervision of Colonel Fuller a few days ago.

The CHAIRMAN. Yes, but I am trying to get some information about your figures as to cost of complete fertilizer.

Doctor GLAESER. My cost figures are based on the Fuller Engineering Co.'s operating cost figures.

The CHAIRMAN. I think we ought to know what their cost is. Is it based on water power production or steam production?

Doctor GLAESER. It was not based on electricity. It was based on coal.

The CHAIRMAN. It was not based on water power at all?

Doctor GLAESER. No; it was based on coal. It was something like \$3.54 per ton.

Senator KEYES. When were those estimates made?

Doctor GLAESER. In 1918.

The CHAIRMAN. If you could do that with coal costing \$3.54 per ton—

Doctor GLAESER (interposing). No, not \$3.54 per ton of coal, but \$3.54 per ton of feldspar.

The CHAIRMAN. What did your coal cost you in those calculations?

Doctor GLAESER. I have not got those figures with me. I am sorry.

The CHAIRMAN. We get back to the fact that we are going to use electric heat, now.

Doctor GLAESER. Yes.

The CHAIRMAN. To do that, we have to have electricity. Are those figures based on the cost of making electricity from coal?

Doctor GLAESER. No; we used coal in our experiments. We used the coal to produce heat.

The CHAIRMAN. And made electricity?

Doctor GLAESER. No; we did not make any electricity. We used coal as the source of the heat.

The CHAIRMAN. I understood you to say that when you got your plant in operation you would use electric heat.

Doctor GLAESER. Exactly. At Muscle Shoals, of course, the energy is much cheaper than if we produced it in a furnace; you know, by means of coal.

The CHAIRMAN. Well, now, then you ought to be able to give us, when you make those calculations, the price of coal.

Doctor GLAESER. I have not got that here. I am sorry. You can easily get that. The Fuller Engineering Co. made the estimate for us.

The CHAIRMAN. As to whether it is cheaper or not depends on what the coal costs to get your heat more than any other one thing.

Doctor GLAESER. I am not prepared to give you the cost of coal. I do not know what it was.

The CHAIRMAN. You have drawn certain conclusions there. You get your potash for nothing, your phosphate at a less price than we pay now. In order to figure that out one of the principal items is the cost of coal, and I want to know what you figure that.

Doctor GLAESER. I can give you the combined operating cost per ton of feldspar, which is \$3.54, which includes all the heat treatment; but what coal was figured at I don't know, but you can easily get that figure by asking Doctor Worden, of Milburn, N. J., or Mr. Gaffney, of the Fuller Engineering Co., to come here. In fact, they will let you see all the cost calculations that they made for us three or four years ago.

The CHAIRMAN. Are you a chemist?

Doctor GLAESER. Yes.

The CHAIRMAN. How long have you been a chemist?

Doctor GLAESER. About 20 years.

The CHAIRMAN. What is your nationality?

Doctor GLAESER. I was a German. I am now an American.

The CHAIRMAN. When did you come to this country?

Doctor GLAESER. In 1903.

The CHAIRMAN. Did you study chemistry in Germany?

Doctor GLAESER. Yes, sir; at Breslau and also in this country.

The CHAIRMAN. I have been very much interested in what you have said, and I am interested in getting what the power costs.

Major, am I right in assuming in order to get the basis of the calculation we would need to know what the coal costs?

Major BURNS. Yes, sir. We do not know how it would compare in this scheme. It is not shown by any comparison with electricity.

The CHAIRMAN. Instead of heating with coal, as you did in your experiments down there, you would use electricity without coal, and it is important to know whether that is cheaper or more expensive than to produce the heat from coal. I assume under ordinary circumstances it would be, because water power down there is cheaper than coal. Everyone will admit that.

Senator KEYES. I suggest, Mr. Chairman, that the witness, if he cares to, would furnish the figures that that engineering company gave him. If they have made those figures, he could get them easily and put them in the record.

The CHAIRMAN. Would you do that, Doctor?

Doctor GLAESER. Yes, certainly. I can mail them to you.

The CHAIRMAN. That is what I mean.

Doctor GLAESER. I will get you the whole cost.

The CHAIRMAN. We are particularly anxious to know in the figuring there—to know what the coal cost.

Doctor GLAESER. From my recollection it was either \$3 or \$4 a ton; something like that. But I can not swear to that.

The CHAIRMAN. We can get electricity at Muscle Shoals, assuming full development there, at about how much per ton of coal?

Major BURNS. If we were making power, the chances are it would be about 5 mills per kilowatt hour, but if you are making electricity it can be sold at a lesser price than if he made electricity by coal. If he is going to burn coal to make electricity to produce the heat at Muscle Shoals he would be able to use electric heat and get it cheaper than he would be able to get coal heat. But that is a little different phase. You do not get as much efficiency out of electricity when you use it as heat as you do out of coal.

The CHAIRMAN. You do not get as much efficiency out of electricity if you convert it to heat as you do if you convert it to power?

Major BURNS. No. Electric heat, as a matter of fact, is pretty expensive.

Doctor GLAESER. I know; but I have been told that there is a lot of electric power available at Muscle Shoals, and I assume that the electric power is produced at a cost much lower than if it were made here.

The CHAIRMAN. Have you made any figure in your mind as to what the electricity down there would be worth?

Doctor GLAESER. No.

The CHAIRMAN. In your statement that you have outlined to us how much power do you use as distinguished now from heat? Is power an item of any considerable importance in your process?

Doctor GLAESER. There isn't much power required. In a 500-ton plant we use about twenty-five 5-horsepower motors.

The CHAIRMAN. That would be 125 horsepower?

Doctor GLAESER. Yes.

The CHAIRMAN. That is quite an item.

Doctor GLAESER. You see, we have to operate those kilns.

The CHAIRMAN. In your figures what kind of power did you use—coal?

Doctor GLAESER. No; we used electric power.

The CHAIRMAN. Electricity by the hydroelectric, or produced by coal?

Doctor GLAESER. No; we bought it.

The CHAIRMAN. Oh, yes. Do you know what you figured it at—what it cost you?

Doctor GLAESER. It is in that estimates. I don't know. It is 2 cents or 3 cents.

The CHAIRMAN. Per kilowatt hour?

Doctor GLAESER. Yes.

The CHAIRMAN. It would make quite a difference whether it was 2 cents or 3 cents.

Doctor GLAESER. I know. But there is such a great margin of profit, you know, that even if the electric power would cost as much, or, rather, if the power necessary for this process here to be used at Muscle Shoals would cost as much as the power cost here in the East, you know, the margin of profit would still be large.

The CHAIRMAN. Your scheme, Doctor, I think is of great importance and worthy of consideration, but it does not bear directly on the question of our development at Muscle Shoals, excepting as we provide there to lease it or operate it ourselves for the manufacture of a complete fertilizer.

Doctor GLAESER. Exactly.

The CHAIRMAN. It would fit in with Muscle Shoals, perhaps, very nicely.

Doctor GLAESER. That is the reason I considered the question of appearing here, because it seems to be interesting.

The CHAIRMAN. It is very interesting, and we are all interested, of course, in getting a fertilizer as cheaply as possible. In fact we have to get some plan to cheapen it or else it is very doubtful whether we can make it.

Doctor GLAESER. You see the main feature of this process here is the exclusion of oxygen in the heat treatment. They did not realize that water vapor causes a great disturbance after the potassium chloride has once been liberated. They did not realize that. It has to be done in a muffle furnace, where the water is kept out, and the hot stuff discharged into a box that is also kept free from water vapor. Air and water steam acting upon liberated potassium chloride in silicate mixtures at elevated temperatures will change this potash back to the insoluble state. By keeping it free from contact with water steam the liberated potash remains soluble.

The CHAIRMAN. If Muscle Shoals is developed—and I presume it will be, whether it is done through a lease or whether the Government does it itself—whoever had charge of it would be very much interested in your outline, and, of course, would give it very careful consideration.

I think it would be well right here to explain, for the record, what a unit is.

Doctor GLAESER. A unit in the fertilizer trade is 20 pounds per ton. One per cent per ton is a unit. One per cent of 2,000 pounds is 20 pounds. A unit is 1 per cent per ton.

The CHAIRMAN. Can you make that any plainer, Major Burns?

Major BURNS. A unit is 20 pounds. That is what it is. It comes about by using 1 per cent per ton. It is only used in the fertilizer trade.

Doctor GLAESER. Phosphoric acid, nitrogen and potash, valuations in fertilizers are based on units. Potash is always expressed in terms of K_2O . K stands for potassium and O for Oxygen. All potash formulas are based on the unit as 1 per cent of K_2O per ton.

The CHAIRMAN. Now, Doctor, have you anything else you want to tell us?

Doctor GLAESER. No, sir; nothing else, except that I urge you to give us consideration. I do not care who takes it up, you know. Somebody will take it up.

The CHAIRMAN. Yes; I suppose so. I do not believe the committee will give direct consideration, because that will come after the plant is developed and we try to utilize it.

Doctor GLAESER. Yes.

The CHAIRMAN. But it is exceedingly interesting. The manner in which you have treated it, I think, is very valuable. It will not be so valuable to us, but it will be very valuable to whoever operates that plant.

Senator KEYES. Looking to the production, which we are all desirous of seeing brought about, of a complete fertilizer.

The CHAIRMAN. Yes, and the testimony we have had about the fertilizer proposition is rather discouraging. Some take a very rosy view about it, although we might just as well face the absolute truth. To my mind I am, rather against my own will, led to the conclusion that unless there is some improvement developed by scientific men the fertilizer proposition does not offer very great inducement to us. What is your conclusion, Major Burns?

Major BURNS. My own view is that the possibility of Muscle Shoals being developed as a fertilizer proposition is not very great.

The CHAIRMAN. I have formed that conclusion from the testimony. In fact my prejudices all go the other way. I am anxious to get fertilizer, no matter who does it, at cheaper prices, as a peace proposition. That is all there is in this for the country. It looked to me for a good while the experts and scientific men said they were going to improve it, I have been brought to a realization that it is absolutely necessary for it to be improved, and I think we can well afford to spend a good deal of money in doing it. It is absolutely necessary to improve it in order to make a completed fertilizer and cheapen the product to the farmer.

Senator KEYES. The prospect of reducing it one-half is rather remote.

The CHAIRMAN. Very remote. It is just a hope, that is all. There is not anything in the testimony to base that opinion on.

If that is all, we are very much obliged to you, Doctor.

Doctor GLAESER. I am obliged to you gentlemen.

(Whereupon at 11.30 o'clock a. m. the committee adjourned subject to call of the chairman.)

MUSCLE SHOALS.

MONDAY, JUNE 12, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to call, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), Capper, Keyes, Ladd, McKinley, Ransdell, Kendrick, Harrison, and Heflin.

The CHAIRMAN. The committee will come to order.

STATEMENT OF MR. TIMOTHY D. GLEESON.

The CHAIRMAN. I wish you would give your name, address, and occupation to the reporter.

Mr. GLEESON. Timothy D. Gleeson, 417 West Forty-seventh Street, New York City. Occupation, contractor and invention coordinator.

The CHAIRMAN. How long have you been in that business, Mr. Gleeson?

Mr. GLEESON. The invention business?

The CHAIRMAN. Yes; and the contracting business.

Mr. GLEESON. Oh, since I left school; 8 years old.

The CHAIRMAN. Have you made an examination of the Muscle Shoals project?

Mr. GLEESON. No, sir.

The CHAIRMAN. What study have you given to the subject?

Mr. GLEESON. I have not made a study. The interest that we take in Muscle Shoals is in its connection to the national preparedness of this country.

The CHAIRMAN. Now, when you say "we" to whom do you refer?

Mr. GLEESON. The Association of Practical Inventors of America.

The CHAIRMAN. Are you a member of that association?

Mr. GLEESON. Yes, sir.

The CHAIRMAN. And an officer of it?

Mr. GLEESON. President and chief examiner.

Senator MCKINLEY. Practical inventors?

Mr. GLEESON. Of America; yes, sir.

The CHAIRMAN. What is the object of that association? Tell us something about it, and of whom it is composed.

Mr. GLEESON. This organization was organized for the purpose of aiding America in the late war. The first work done by this organization was sending plans to the Navy Department for the construction of dry docks of a larger type, a copy of which was published in the New York World, Sunday, April 15, or a description of it. In this we offered the Government to supply it with men capable of supervising the construction of a drydock in 90 days by an entirely new principle. In this work we agreed to do or perform this work aided only by enlisted men, with the implements and equipment of which the War Department had at the location which would be selected for the work.

In August, of 1918, I appeared before Rear Admiral Strothersmith. I was then supervisor of inspection and the specifications division under Major Crosby. We submitted to Rear Admiral Strothersmith this plan which I have here. It is a plan for the protection of cargo-carrying boats from the torpedoes shot from submarines.

The CHAIRMAN. How large a membership have you in that organization?

Mr. GLEESON. Our membership varies. We sometimes have a thousand. Our men travel all over the world. We have got men on water, men on the sea.

While I was speaking to Rear Admiral Strothersmith on behalf of the organization, we submitted a plan which had for its main object the prevention of land communications for submarines, which I believe was acceptable and used by the admiral. Many times during the war I was compelled to appeal to Rear Admiral Bradley A. Fiske, due to the inattention which the plans and communications which we sent to the Navy Department received at that time. Rear Admiral Bradley Fiske admitted that he was unable to render us any aid whatever. He told us that his recommendation would have a deterrent effect on the acceptance. This report that I have submitted a copy of to this committee calls attention to the inadvisability of selecting as inspectors of ammunition men taken from the civil service list, owing to their inexperience, lack of instruction, and, in many cases, lack of physical ability to withstand the odors and poisons which are met with.

The CHAIRMAN. I was anxious only to have you state in a general way, so the committee would get an idea what your business has been and what you have done. I want to get down to what you think of Muscle Shoals.

Mr. GLEESON. I am a graduate of the United States ordnance shell loading school, at Morgan, N. J.; one of five members of that organization that passed with 107.

The CHAIRMAN. What study have you or has your organization made of any proposition connected with the matters that we have here before us for hearing, in regard to Muscle Shoals?

Mr. GLEESON. An inventor or scientist is like a doctor or lawyer. They are on different cases every day. There are matters brought to their attention that affect conditions at a distance. From the reports given me by my men. I am thoroughly convinced that should the stock and the control of Muscle Shoals fall into the hands of unfriendly elements, due to the effect of the cheapness of the development of power in Muscle Shoals, they can select a hundred, one dozen, or ten thousand or more articles which require power in their manufacture, which are being manufactured in American factories, from which the American manufacturer makes a profit and American workmen make living wages, and they can manufacture them so cheap, if they got control of Muscle Shoals, that they can flood our markets and destroy our markets. They can then, with the surplus left over, send and fill our export orders. If they ship that in foreign bottoms they will drive our fleet from the sea, drive our cargo-carrying fleet from the sea. I would like to impress upon you gentlemen the fact that there should be control of this Muscle Shoals, which is of more value to America than the gold of Klondike and of as much importance as the Panama Canal—should this control fall into the hands of men who should so desire, they can bankrupt America.

Senator CAPPER. May I ask what plan you suggest for the control of Muscle Shoals?

Mr. GLEESON. That this country keep that Muscle Shoals for 10 years, construct and maintain a bureau as described in the report which I submitted to your committee, which has for its object the training, instruction, experimenting, and opportunity for experimenting and research work in explosive chemistry and in the mechanism and machinery used for war purposes; to use as the instructors Army and Navy officers and enlisted men of good records, who have had experience in the battle fields of Europe and in the training camps of America; and America would thereby gain in preparedness far more than she would gain from the offer of any particular bidders for that plant. America lost more through the inefficiency of 50 of its one-dollar-a-year men during the late war than the amount of the entire bidders in the cost of completion of those dams and the operation of that plant for the next 50 years.

When we entered the war our Ordnance Department was not prepared or had not received sufficient instruction to manufacture munitions. We were compelled to take men from the du Pont people, the Bethlehem Steel Co., the General Chemical Co., and other corporations employed in the manufacture of material for war purposes. The first men we took we assigned to the work of preparing the instruction and for operation of factories. When those factories were completed and ready for operation these men found that the men of the Ordnance Department had not received sufficient instruction to carry out their orders, and they were then compelled to take men from their own corporations, or from other corporations engaged in the same line of manufacture, and place them in charge of the departments. While these men did good work throughout the war, when the armistice was signed they went back to their own corpora-

tions, and the Ordnance Department to-day is not advanced to the point which it should be. It lacks standardization. It has not gained in efficiency through this war lesson, as it should have done, and it is not due to the officials of the Ordnance Department. The officials of the Ordnance Department are competent, capable men, men whom I have seen, like Crosby Field, work 12, 14 hours a day, 7 days a week; and other men the same. That is due to the interference of welfare workers, advertising men, contractors' agents, and politicians, and the work of manufacturers of munitions.

I have given this committee two letters. One describes the explosion in Morgan, N. J., and the other is some statements I have brought to the attention of Rear Admiral Strothersmith at the time when I appeared before him the second time—I appeared before him twice—as to the condition of New York City.

New York City is to-day, and was throughout the war, the most defenseless first-class city in the world, due to the fact that its water system, with its powerful pressure—47 pounds per foot, or from 27 to 47 pounds—runs so close to the sewer that at any time, without a violation of a corporation ordinance, a manhole could be lifted, the sewer emptied through the manhole, and an amount of explosives deposited close to the water main that would not only destroy New York City but would affect the efficiency of the Brooklyn Navy Yard, due to the fact that the East River water in that section of Brooklyn, N. Y., is all oil, and if they took water for their boilers from the river their boilers would foam.

Senator HEFLIN. Do you recall the report made by an investigating committee in the House when it urged that this whole project be abandoned down there—that it was nothing but a lot of junk?

Mr. GLEESON. No, Senator; I do not.

Senator HEFLIN. A year ago or more. When was your attention first drawn to this Muscle Shoals project?

Mr. GLEESON. In 1900 I was a partner of Bill Hoy, the diver that got drowned in Jersey. He had been down with the United States engineers at Colombia, and worked as a diver down there, and had been interested in this Muscle Shoals. I had as a roommate at that time for several years a Major Camp, of Mississippi, who had made a study of Muscle Shoals, of the possibilities, of its power, and of its general condition.

Senator HEFLIN. Well, when did you have your attention drawn to it recently? You say you do not recall this House committee's report when it recommended that it should be abandoned and it was abandoned. You don't know anything about that report, do you?

Mr. GLEESON. I have never seen it.

Senator HEFLIN. When were you invited to look into it and express your opinion on it? Since Mr. Ford made his offer or before?

Mr. GLEESON. Since.

Senator HEFLIN. Since he made his offer? You are opposed to accepting the Ford offer?

Mr. GLEESON. Well, I believe that Muscle Shoals is one of the main assets of America, and I believe that, due to the unsettled condition of Europe at the present time, where through the companionship of misfortune a combination needs only the leadership to attain the resources and the man power of Russia, the science of Germany, and the energy of Japan, due to that fact, I believe—and men that I have spoken to believe—that this country should retain Muscle Shoals and operate it through Government ownership and operation or under Government direction and cooperation, which would allow the use or development of part of the plant which was supposed to be next to any locality.

Senator HEFLIN. So you would have us just take charge of it and shut out all these bids made by private individuals for a period of 10 years?

Mr. GLEESON. Yes. I believe that the experience gained by our Army officers and by our Navy officers and by our men, when given to this Government and in a condition in which the Muscle Shoals will allow it be presented, will make Muscle Shoals so valuable that 10 years from now this Government would not part with it for any amount of money.

Senator HEFLIN. Before Mr. Ford made his offer it was just lying there. Nobody was figuring on it and nobody made an offer for it. But as soon as he has made his offer, and it looked like the Government was going to look with favor upon it—

Mr. GLEESON. It is hard to make this Government move. I made the statement here that New York City that, from the Nation's standpoint, is the backbone of America, it was the most defenseless city in the world. The loss of New York City would be a calamity throughout the world. Whom did that interest? It is hard to interest America, and for that reason I believe that Senator Norris has found a solution in this bill of his. Enact this bill and put men in a position where they can act, men who can understand you when you come back to them—

Senator HEFLIN. You think, then—

Mr. GLEESON. I think Senator Norris's plan is the most effective plan that has been offered to this Government since the Muscle Shoals was taken under consideration.

Do you know the record of the Cyanide Co. of America that built that plant, as compared with its supply of explosives to this Government? Up to the time of the signing of the armistice the Cyanide Co. of America manufactured 500 tons of ammonium nitrate under six specifications. The calculations were, from the information I have received as to the amount of explosives used in action as compared with those manufactured in relation to high explosive shells, that 1 out of every 1,200 high explosive shells that was manufactured found a place in action. By using that as a basis of calculation and assuming that all the ammonium nitrate supplied by the Cyanide Co. of America to the Ordnance Department, in allowing them to the day of the signing of the armistice—it would have to be sent in a month before that to get action, but allowing them that latitude a 75-millimeter shell contains 2 pounds of explosives, 1 pound of T. N. T., and 1 pound of ammonium nitrate, and with all this great preparation, the aggregation of bacteriologists, lacking practical experience which is now possessed by the Army officers, this plant turned over to the Ordnance Department a sufficient amount of explosives to load 200 shells. A 75-millimeter gun shoots 30 a minute. With all this big preparation, with all this big organization, that company supplied the Ordnance Department with a sufficient amount of explosives to supply a 75-millimeter gun for 7½ minutes.

The CHAIRMAN. You mean that was all the supply of explosives that they had?

Mr. GLEESON. That is all the supply.

The CHAIRMAN. Well, that was before the erection of this plant?

Mr. GLEESON. No; that is giving them up to the day of the armistice.

Senator HEFLIN. In other words, you mean that if they had 100 shells only about 20 of them would shoot?

Mr. GLEESON. No. How many shells went up in the Morgan explosion? How many shells were lost on boats that went down or through the battle front being changed, or misdirected? The average is supposed to be, and the accepted average, that 1 out of ever 1,200 shells manufactured and loaded in an ammunition plant is used in action.

The CHAIRMAN. You mean there is one out of every 1,200 that—

Mr. GLEESON. That finds its way to actual action. I mention that to impress you with the vast amount of explosives necessary should we go into hostilities. You must remember, Senator, that in the last war we had the supervision of two countries.

Senator HEFLIN. That would not happen, would it, ordinarily? That was a new experiment with us with these high explosives?

Mr. GLEESON. Nothing would happen. I went to Morgan as a student in the shell-loading school, and they told me it could not happen. That is the history of explosion—that it can not happen. There never was an explosion caused by an explosive. It has been caused by the use of an explosive.

Senator HEFLIN. You mean somebody caused it to explode?

Mr. GLEESON. I mean by any explosion. Take dynamite. There never was an explosion caused by the use of dynamite. It has been caused by the misuse of dynamite and by the abuse of dynamite.

Senator HEFLIN. Do you mean that somebody would do it purposely or accidentally, or what?

Mr. GLEESON. Well, explosives—the ordnance officials will tell you that explosives should be given over to men physically fit. A nervous man—there is not any difference between a nervous man in an ammunition plant and a man with incendiary intent.

Senator HEFLIN. You mean if he drops it, then the thing happens?

Mr. GLEESON. If one man loses his heart, you lose the plant. Have you read the report on that Morgan explosion, Senator?

Senator HEFLIN. No; I have not.

Mr. GLEESON. It is interesting. It will give you a good line on civil service. I said right here that the selection of men for the work of handling explosives, of men taken from civil service, is a national menace.

Senator HEFLIN. You think they ought to be selected from men who have had experience?

Mr. GLEESON. The men should be tried. If you had a roof to fix on your house to-day you would get a roofer, or if you had some plumbing to do you would get a plumber. You would not go out there and put a piece of paper in a man's hand and say, "Write down 'I am a plumber,'" and let him come in and do your work for you. Still, the Government will do that. They should be practical men that understand their business, physically fit for that business, even though they can not pass an examination. They should be physically adapted by nature. Take Grant. He could not handle a bank roll, but he could handle an army. Lincoln could not run a grocery store, but when he had the Government behind him he could run a government. There were naturally fit and naturally adapted to the work, and you can't beat nature.

Senator HEFLIN. Now, getting back to Muscle Shoals, this great water power down there is serving no good purpose. Mr. Ford proposes to utilize it and to turn it over to the Government in time of war to make nitrate and other war materials. Why not let him use it during this 10 years that you are talking about, and if a war should come the Government will have the use of it.

Mr. GLEESON. Well, why does not the Government take it? The Government has got a better record for accomplishment than Ford has. In America to-day there is ten times the amount of scientific and mechanical ingenuity as there is in Germany and France and all these big laboratories combined, and all America has got to do is to prepare an avenue such as described in Senator Norris's bill, adopt the method which was adopted by Napoleon, and have the knowledge broadcasted that you want the best, and every position in these departments or this organization is open to ability, and there is not anything that Germany has to-day or France has—and I will include the German dyes—that I can not duplicate in six months with these resources. Why should the Government not do it? The farmer wants plows. Why doesn't Ford expand and make plows for the farmer? The farmer wants ditching machines. Why doesn't he make ditching machines? Why doesn't he make steam shovels? He doesn't understand how to do it.

Senator HEFLIN. He may do that down there. He is going to make a lot of things if he gets this water power.

Mr. GLEESON. I will tell you what he did do, Senator. The housing situation in New York City, the shortage of homes for the poor people of New York City is affecting the birth rate of the country. It is affecting the health and morality of this country. It will be felt in future generations. We have got in New York City 300,000 flivvers housed in garages and places formerly occupied by the poor tenement families, and they were ripped down to build those garages, and 1 out of every 10 of those 300,000 flivvers occupies a place that was formerly the home of a contented family and a workman, and if Mr. Ford was a philanthropist and wanted to help the people, why doesn't he take his big resources that he has got and build homes to house these poor people that he has menaced through the scourge of flivvers making them homeless?

Senator HEFLIN. On the other hand, he has sold those machines through the country and he has enabled thousands and hundreds of thousands of farmers to own these machines because they are cheap, and he has thereby increased their comfort and convenience. But you would withhold that from them in order to take care of New York City. Is that the idea?

Mr. GLEESON. I would withhold any comfort in order to save life—life and human health.

Senator HEFLIN. You said a while ago that New York is the most important point in the United States.

Mr. GLEESON. From the Nation's standpoint. It is the backbone of America.

Senator HEFLIN. A good many people seem to have that theory down there.

Mr. GLEESON. I would give five years of my life, Senator, for your eloquence, to be able to explain this as I would like to in order to bring about the Government ownership and control.

Senator HEFLIN. You have explained very glibly, I think.

Mr. GLEESON. The Senator's bill wants to create a condition similar to that created by Germany for years previous to the war. It was to encourage and enable the scientists and inventors to bring out improvement and development, which then became national property. At the present time let us consider Germany. Its army is destroyed. Its navy is scrapped. It is shackled down by taxation and reparations payments. Its currency is not much better than waste paper. And still, with all that, due to the loyalty and ingenuity of its inventors and its scientists, aided by the fact that the Government claims the ownership and does own and control scientific knowledge, it will be only a few years before, with the aid of this scientific knowledge for capital when everything else has failed, Germany will be back as a first-class nation, and in the face of that, what offer does Ford or any other bidder who is now bidding on Muscle Shoals offer to America that would compare with that prospect or that opportunity?

From the late war we have got men gassed, subjected to conditions of bad breathing, exposure, and they are cramped up in cities. Why not bring these men down and let them breathe broad ozone on the broad prairies down there and furnish them work and employment, and let the Government be the gainer by the experience and by the efficiency that they will develop, which will give this country the highest state of preparedness and protection, which will mean security and industrial peace for years to come?

Senator HEFLIN. How many men would it give employment to down there, of these ex-soldiers you are speaking about?

Mr. GLEESON. I should say, if I was running the job, I would give everyone that wanted to work a job. I would find a place for him.

Senator HEFLIN. Will the project down there admit of that?

Mr. GLEESON. That project down there, from a Government standpoint, when the Government goes in for the manufacture of munitions, when they go in for the manufacture of fertilizer, when they go into experiment, Senator, you must remember that there are many improvements. The improvements made in our power machinery are such that it is reasonable to assume that within the next 10 years the improvement and advancement in water-power machinery will equal that of the automobile and the airplane in the past 10 years.

Senator HEFLIN. Well, how many men do you think, now, the Government could furnish work to at Muscle Shoals?

Mr. Ford has proposed to give several thousand men employment, and it has been said here by witnesses who oppose his bid that it would not require but a few men to make fertilizers or munitions.

Mr. GLEESON. I would like, with your permission, Senator, to finish this. I believe it pretty important at this point.

Senator HEFLIN. All right.

Mr. GLEESON. Due to the fact of the cheapness of water power, the improvement has gone so far that even to-day there are men in New York City who, by attaching the water-power machinery to Blackwell Island, which was formerly used for convicts, can supply light, heat, and power to New York City, but they won't be allowed to do it, because they can not lay pipes. But the point I want to make is the cheapness of electric light and electricity for heating purposes and for all the purposes for which illuminating coal gas has been formerly used will cause the abandonment and abolition of the illuminating gas plants; and it is from the illuminating gas plants that we get the supply of T. N. T., which, in turn, is nitrated—we get our supply of toluol, which is again nitrated and becomes T. N. T. Should the illuminating gas plants shut down, America will be confronted with the necessity of discovering a substitute for T. N. T. for loading its high explosive shells. If you turn over this plant to Ford or to any of the other bidders—not mentioning Ford in particular, but any bidder—and the change in power is made in these illuminating gas plants—and they are owned to-day by the same company, and they will install economic measures at any time—America will be confronted with the necessity of discovering a substitute for T. N. T., and she will have to build nitrate plants, and she will never get as desirable a location as is offered by Muscle Shoals.

Senator HEFLIN. But Ford offers to turn this one over to the Government if she needs it.

Mr. GLEESON. You heard what Washington said, Senator? "In time of peace prepare for war."

The CHAIRMAN. Your theory is that if we turned it over to Ford or anybody else and we get into war and they turn it back to us we won't be ready to handle it?

Mr. GLEESON. We will have the same condition that confronted us with the airplane situation, where this Government spent a billion dollars in an attempt to kill two birds with one stone, manufacture battle planes and improve the Liberty motor. The Government spent a billion dollars, and the sum total of the knowledge that we gained by building battle planes and improving the Liberty motor was the fact that we could have made castor oil out of castor beans, and we could have found that out from a black savage off of a boat. You should not wait until the last minute. In the late war there was time, but the next time, an hour, a day, or a week, will mean extinction.

I don't want to change your impression of Ford. Ford is a good man. The name of Ford carries with it an assurance of fair dealing. But this job is too big for Ford. There is no organization capable of undertaking Muscle Shoals with the exception of the United States Government itself.

The CHAIRMAN. Let me ask you in your analysis of the Ford bid and anybody else's bid, have you found any of them that have even agreed to keep up the analysis and the experimentation that is provided for in the bill that you speak of?

Mr. GLEESON. Well, Senator, I have not done that, but of course I do not place much faith in a contracted agreement. You take John A. Stevens. John A. Stevens is a great engineer. He was General Goethals predecessor in the Panama Canal. When John A. Stevens resigned as constructor general of the Panama Canal it was believed to be a national calamity. He came on to New York and started half a dozen contracts and failed in every one of them. One that he failed on was a branch of the subway. It was built by Bill Devery, a former police officer, and Frank Farrell, a race track bookmaker, who never knew anything about contracts. A contractor stands well while he is making a profit. Any official of the United States Government that has had to do with contractors will tell you that if a lawyer disputes the amount and wants to refuse payment of the contract he will find fault with the plans. I have had experience with contractors since I was 8 years old.

The CHAIRMAN. Have you examined Mr. Ford's proposition in detail?

Mr. GLEESON. I merely read over that Rowland Thomas—I think his name is—of the World.

The CHAIRMAN. I want to ask you, Are you familiar with that part of the contract in which it is provided that the Government of the United States shall guarantee during this entire 100 years to repair both of those dams, and that the only compensation for repairing one of them will be to the extent of \$20,000 in dam No. 3 and \$35,000 in dam No. 2, that they shall receive from Mr. Ford? As a contractor and inventor, now, do you think that in a hundred years, taking it over a term of a hundred years, there is liable to occur many years in which a much larger amount than that will have to be paid to keep the dams in repair, and that it will amount to several million dollars, all of which the Government, with the exception of the sums I have named under Ford's contract, has got to pay without any return, without any recompense, and without any interest on its money?

Mr. GLEESON. We have a precedent at Johnstown, Pa. A well-built dam gave way.

The CHAIRMAN. Yes.

Mr. GLEESON. I believe in reading over Ford's bid it was a bid offered by a man who thought he had no competition; that the Government was in a position that they would have to give it to him; that it was a matter of courtesy as to the amount. Now, another point that I wish to make. In this report here, of which the committee has a copy, this calls for the organization of a national construction, training, experimenting, and instruction bureau for explosive materials, tests, and supervisors, and it goes on to say—and it has not been contradicted as yet that this bureau would mean a lot in the way of preparedness. Had England and France maintained and developed a national institution such as described above their military preparation would have been advanced to the extent that the German military officers would have realized that their advantage by superior preparedness would have been so slight that they would have delayed the opening of hostilities, no doubt, indefinitely. Now, I have given a copy of these two reports to Ford's chief engineer at 1720 Broadway not three weeks ago. I told him to contradict these statements, if he could, that are contained in these reports.

Now, what became of all these aspirations that Ford was supposed to maintain relative to peace for the world and peace amongst men and brotherly love when he rigged out this ship? Was this peace ship for advertising purposes?

Senator HEFLIN. I don't know. Do you think that is pertinent to this inquiry as to whether he should have Muscle Shoals now?

Mr. GLEESON. I think it is very pertinent to the consideration of the offer, inasmuch as preparation means protection.

Senator HEFLIN. We know that he made a success in making automobiles, and selling them so cheap that the common man could buy them. Now, he says that he will make fertilizers so cheap that the farmer can buy them at about half the price that he is paying to-day. If he can do that, he will bless and benefit millions of American farmers.

Mr. GLEESON. Senator, I read in the Engineering News, I believe it was, of March, 1918, where the Navy Department advertised for sale 3,000,000 pounds of ammonium nitrate. If ammonium nitrate was a fertilizer, why in the name of common sense did not some of these people buy it? This specification that ammonium nitrate is made out of is not a fertilizer.

Senator HEFLIN. Are you an expert on fertilizer ingredients?

Mr. GLEESON. We have tried it on plants. We have tried cultivation, and instead of cultivating it, it was destroyed.

Senator HEFLIN. Don't you think Ford can manufacture fertilizers at Muscle Shoals?

Mr. GLEESON. I think a great country like this country here, Ford should come to these men, come to the officials and representatives of the country and find the needs of the country in the preparation of his bid. Ford seems to be carried away with his own importance. It is a case of Ford, the "U. S. I."

Senator HEFLIN. The question I asked you was whether you believe he can manufacture fertilizers at Muscle Shoals?

Mr. GLEESON. No; I don't believe he can manufacture fertilizers.

Senator HEFLIN. The testimony before us is that Mr. Edison says that there are phosphate rock beds and also potash beds in that vicinity. He says it is the most desirable place in the world—I believe that was his statement—for making fertilizers, because the ingredients are there. Now, you don't agree with Mr. Edison about that?

Mr. GLEESON. Well, I never met with Mr. Edison, but I have had experience with Mr. Maxim. He is quite an expert along the same line. He recommended women inspectors for absolute protection of munitions plants. In Old Bridge, N. J., he installed half a dozen women inspectors. There was a rule against anyone running in the plant, but I caught a woman running and I asked her what was the matter, and she said, "I am scared to death." She says, "The lady that Maxim recommended for absolutely safeguarding," she says, "she smokes a little, and stepped on a couple of parlor matches that she dropped and refused to pick up."

So I have never met Mr. Edison. I have had a lot of experience in this explosive business, but I have never met Mr. Edison. I can't see anything that Mr. Edison has done in the Ordnance Department. I tried to get them to let me go into a conference that was attended by Mr. Edison and his chief engineer, Hutchison, who was supposed to be his secretary.

Senator HEFLIN. Is that Reece Hutchison?

Mr. GLEESON. Hutchison is his last name. The difference between the Government manufacture and the manufacture of private material is that in the Government manufacture of war materials there is a certain sacredness. The private manufacturer manufactures war material the same as a 5 and 10 cent store, on the bonus, and they don't care what the condition of the ammunition is so they can get rid of it.

The CHAIRMAN. Is there anything further you want to say?

Mr. GLEESON. Well, Senator, I want to thank you gentlemen for the leniency you have shown me and the latitude that you have given me, and I hope your bill goes through.

The CHAIRMAN. Well, we are very much obliged to you.

ADDITIONAL STATEMENT OF MR. J. H. LEVERING, CIVIL ENGINEER, WASHINGTON, D. C.

The CHAIRMAN. I understand that when you testified before you had some information in regard to the maintenance of these dams that you forgot to mention, and which you desire to put into the record now.

Mr. LEVERING. Yes, sir.

The CHAIRMAN. I will ask you to go ahead and state it.

Mr. LEVERING. I will state that a short time ago the Interior Department published a book on superpower problem by Mr. Murray and at least 25 or 30 other engineers, and they made a very accurate report on maintenance of dams taken from actual figures. On page 226 you will find their report, and on page 27 the engineers'.

The CHAIRMAN. Is that the so-called Murray report?

Mr. LEVERING. Yes.

The CHAIRMAN. Comparing cost of electricity in America with cost in Canada?

Mr. LEVERING. Yes.

The CHAIRMAN. Yes. I just wanted to identify it.

Mr. LEVERING. In which he states that the dam maintenance will run from 1 to 3 per cent of the actual cost, which would make these two dams run from a half million to one and a half million dollars per annum.

I want to state that I have checked up very carefully the actual expenditures on several Government dams, which I will hand you, and comparing them with the actual expenditures with the Muscle Shoals dams the annual maintenance charges will run more than Mr. Ford will pay the Government for interest and other items annually to the Government.

The CHAIRMAN. What dams were those?

Mr. LEVERING. I have taken the Roosevelt Dam at—

The CHAIRMAN. At Phoenix, Ariz.?

Mr. LEVERING. At Phoenix, which is supposed to be a well-constructed dam.

The CHAIRMAN. Yes; I think it is.

Mr. LEVERING. I took the Granite Reef Dam, built by the Government and maintained by the Government, and therefore we get the Government expenditures. I have taken the dam at Lagoona and the actual expenses as they appear in the reports of the Government; and I have also taken the dam at Keokuk, but I have not got that quite ready.

The CHAIRMAN. When you get these you will give them to the reporter?

Mr. LEVERING. Yes, sir. I want to say that when I made investigation both times at Muscle Shoals I was impressed with the amount of water issuing at the Tuscumbia Spring. I took the matter up with Mr. Fred Cranford, who is, I think, one of the most experienced contractors in America, and he was at Muscle Shoals in behalf of Secretary Baker during the construction, and he informed me that an examination of the Tuscumbia was first a chemical analysis of the contents of the water at the dam and at the spring—these checked. To make it certain that that river water was issuing from the spring, they took a bacterial count of the water at the dam and at the spring; and sunshine bacteria is different from the bacteria in subterranean channels; and they checked.

The CHAIRMAN. And he reached the opinion that the water emerging at the Tuscumbia Spring came from the Tennessee River?

Mr. LEVERING. Yes, sir.

The CHAIRMAN. But he was not able to tell whether it came from above or below the dam, was he?

Mr. LEVERING. It could not come from below the dam, because it would not have come out at Tuscumbia. Major Burns can tell you about that.

Major BURNS. That is a hard thing to tell, because you have to get the levels. I don't know how much higher the river is at Tuscumbia. It would be a little bit higher.

The CHAIRMAN. It would not necessarily follow that there is anything wrong with the foundation of the dam even if it were true. It would show that some water is getting away, that is all.

Major BURNS. Yes, sir.

The CHAIRMAN. And we do not know where it is leaving the river.

Major BURNS. You saw the spring?

The CHAIRMAN. Yes, sir.

Major BURNS. It is like a subterranean river emerging at that spring.

The CHAIRMAN. If it came from above the dam, within reasonable distance above the dam, and the dam were completed and the head increased, it would show down in the spring, would it not?

Mr. LEVERING. Yes. It has got to be water sealed or the maintenance charge will run more than it does at Hales Bar. I want to say that I heard Secretary Weeks testify that on a foundation somewhat similar to Muscle Shoals the estimates at Hales Bar were \$3,000,000, for completion. The dam has now got about \$11,000,000 in it, and with the same rate of maintenance of these dams it would run into several millions of dollars the Government

would have to pay each year, or at least part of it it would have to pay each year out of the revenues of the Government over and above the receipts from the Ford contract.

The CHAIRMAN. As an engineer, now, I will ask you whether or not it is true that we could expect the repair and upkeep of the dam to increase after it had been in use for a great number of years. For instance, this lease to Mr. Ford, if it is made, will be for a hundred years. Would it be reasonable to expect that the upkeep of the dams, after they had been used for 40 or 50 or 60 years, would be greater than it is now when the dams are new?

Mr. LEVERING. Much greater. The oldest concrete dam we have, I believe, is about 40 years old. Several have been rebuilt since that time.

The CHAIRMAN. Where is that one 40 years old?

Mr. LEVERING. Somewhere in the East. I don't recall just where. The oldest one that I know is the Sweetwater Dam, in California. I am familiar with that. That was built probably 30 years ago, or 35 years ago, and it has been rebuilt three times, and that was built by Schuyler, and on good foundations. The foundation has never given much trouble.

The CHAIRMAN. The Ford proposition provides that the Government—

Mr. LEVERING. Can I make one more suggestion? I am afraid I will forget it.

The CHAIRMAN. All right.

Mr. LEVERING. Mr. Rickey, the chief engineer of the Aluminum Co. of America, went to Muscle Shoals long before the Ford offer was put in for the purpose of putting in an offer for the Aluminum Co. of America. They had had experience on the Tennessee River at Hales Bar. They furnished part of that money and had a very unsatisfactory experience with it, and they had considered the maintenance of that dam very carefully, and he advised his people that it was a dangerous proposition to bid on Muscle Shoals and open to a big risk.

The CHAIRMAN. Well, I don't believe it is open to any bigger risk than anything else. There is nothing sure. I think we have remarkably good evidence, based upon the best that can possibly be obtained, that all of the precautions have been taken in building the dam there that it is just as good as it is possible to build, but of course it may go out some day.

Mr. LEVERING. But this is true, Senator Norris, that if that dam is all right Mr. Ford should keep the \$55,000 and do the maintenance. If it is an unfair price, it should not be put on the American people.

The CHAIRMAN. It is not \$55,000 Mr. Ford agrees to pay. He agrees to pay to the Government \$20,000 for the repair and upkeep of Dam No. 3, and \$35,000 annually for the repair and upkeep of Dam No. 2. That includes the locks. Under his bid he keeps in repair the upper end of the dam. His bid specifically states that the Government must keep the dam in repair during the entire hundred years for that contribution. He does not use that to repair it, but the Government has to do it. The Government, under his bid, is bound to keep both of those dams properly repaired during the entire hundred years.

(Whereupon, at 12 o'clock noon, the committee adjourned to 10.30 o'clock to-morrow, Tuesday, June 13, 1922.)

MUSCLE SHOALS.

TUESDAY, JUNE 13, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in Room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), Capper, Keyes, Ladd, McKinley, Kendrick, and Heflin.

The CHAIRMAN. The committee will come to order.

STATEMENT OF MR. W. G. WALDO, CONSULTING ENGINEER, TENNESSEE RIVER IMPROVEMENT ASSOCIATION.

The CHAIRMAN. State your name and occupation.

Mr. WALDO. My name is W. G. Waldo. I am consulting engineer for the Tennessee River Improvement Association, with headquarters at Chattanooga, Tenn.

The CHAIRMAN. Tell us about this organization. What is it; just briefly?

Mr. WALDO. Mr. Chairman, the Tennessee River Improvement Association is one of those loose organizations that a man can join by contributing anything from a nickel to \$500 who has at heart the interests of the Tennessee Valley. Those people who support it to the greatest extent, of course, are those who expect to gain by the improvement of the navigation of the Tennessee River, the development of power, the increase in the industries, the utilization of natural resources, and all of those things that go to make up a comprehensive program of development.

Among the duties that I have had in connection with the association has been that of looking after the financial end of it, and in that connection I have made the acquaintance of a good many business men up and down the Tennessee Valley, from the Republican section in east Tennessee, up around Knoxville, across to the Democratic sections in the Memphis territory at the other end of it.

The CHAIRMAN. You are in a fair way, then, to judge between the two, I suppose.

Mr. WALDO. I have had a good opportunity to obtain an idea of popular opinion on this subject, Senator, because I have come in contact with a good many people. I would like to present to you some facts in regard to Muscle Shoals. We have had a great many generalities and statements of one kind or another, but what I would like to offer is simply a statement of the concrete facts that we have available regarding this matter.

The association has been interested in Muscle Shoals for a good many years. I was surprised the other day to find a report of the Tennessee River Improvement Association, dated December 5, 1877, over here in the Congressional Library. My personal connection with the association dates from 1916. At the outset the idea of the association was simply to secure the improvement of the navigation of the Tennessee River. Later various other features came to be recognized as a necessary part of any program of permanent navigation improvement, so we adopted the broad plan of development involving principles which we hope may be introduced generally in the improvement of rivers in the United States. In connection with this program the association has been

working with the Ford organization in bringing out an offer that would embody these principles. That is why we are for the Ford offer, because it does cover these principles in a broad way.

We had formerly been for Government operation of the Muscle Shoals project, and there are features of Government operation which we think are absolutely sound and certainly worthy of the support of any organization. At the same time, we realize that there are certain difficulties with it, which we believe are obviated by the Ford offer.

There have been nearly a hundred surveys of the Tennessee River in the last 90 years. Of those surveys there is only one that, in a detailed and in a comprehensive way, has covered the power situation and the other features in connection with the navigation. In all there are more than 10,000 investigations and surveys that have been made by the Engineer Department, and you can count on your fingers, practically, those surveys that have covered all the features that enter into such a proposition.

In speaking with General Taylor this morning he said that he did not think that there were more than a dozen surveys, all told, that considered so important an element as the power feature frequently is. We maintain that the improvement of a stream strictly for navigation purposes and for navigation purposes together with power development are two very different things. I would like to point out a few reasons why they are so decidedly different.

The Government has expended for navigation improvements of the Tennessee River up to June 30, 1921, \$14,686,397; on the Ohio River for the same period they have expended \$142,008,372. Although the Tennessee River is slightly the larger stream it has received about one-tenth, as you see, of the expenditures. But our idea is not simply to see how much money can be spent on the Tennessee River, but to see that we get the most for the money that is expended. In order to point out the accomplishments under present plans we prepared the chart that is here on this wall. It shows the efforts of the United States Engineers to secure a 3-foot channel by open-channel methods between Chattanooga and Knoxville. The red line shows the progress, starting at about 45 per cent completion in 1874, and in 1920, after a progression that seems to be mostly backward, arriving at 39 per cent completion, with no power development.

The solid black line shows the estimates of the cost of that improvement of this channel, varying from examination to examination, and the curve of expenditures, as you see, is increasing rapidly in the last four or five years; also the curve of estimates has gone up rapidly in recent years. It is evident from that chart that we are not going forward; that as fast as the channel is opened up a flood comes along, and for this reason or another the channel is partially filled and the work has to be done over again. We maintain that in such a case the principle of that is wrong; that if the navigation is to be valuable it must be a permanent navigation of sufficient depth and continuity to make a commercially navigable stream. In order to have permanent navigation you must have locks and dams, and if you have locks and dams then the question naturally arises, Why not develop the power that may be commercially available there?

Of course, it is an important feature that the flow of a navigable stream can not be stopped. You must allow it to run at some reasonable minimum rate. The United States Engineers would never give their approval to a project which contemplated the shutting off of the ordinary flow of a navigable stream. That has had a great deal to do with the development of power, because it makes it difficult to secure pondage or storage for power purposes under ordinary conditions, a difficulty that has been pointed out by a number of reports of the United States Engineers.

In general, a permanent channel is the only one that is of any consequence. This channel, you can see from the chart over here, is not a permanent channel. The United States Engineers have explained that the traffic on the Tennessee River did not justify the expenditures which would be necessary for a permanent improvement. We maintain that the Tennessee River never has had a chance.

If you had a boat line I would ask any of you gentlemen whether you would be willing to undertake to operate between Chattanooga and Knoxville when you knew that your channel, corresponding to the roadbed of a railroad, was going to be in that condition [indicating chart]; in other words, about 50 per cent of

the time wholly unreliable, and the remaining 50 per cent of the time partially unreliable, so much so that you might have an accident at any time that would cost you more than your net earnings for an entire year. It is manifest to the people who attempt to use these streams that the actual traffic on a stream is no conclusive criterion for judgment as to how much that stream ought to have in the way of appropriations. We maintain that the idea of the United States engineers in setting up the actual traffic that exists on these partially developed streams as a basis for judging their navigable value is wrong. There is one example, and it is a striking one, of a fully developed stream, with a permanent channel, outside of the Great Lakes, and that is the Monongahela River. The Monongahela River transported in 1920 24,264,354 tons of freight, 85 per cent of which was coal, into the Pittsburgh district. It is the availability of the Monongahela River which has made possible the development of cheap pig iron manufacture in the Pittsburgh district, combined with the advantages that they get from the water transportation of ore on the Great Lakes. We consider the Monongahela to be an outstanding example of successful inland river navigation.

As to navigation on the Great Lakes, there is more traffic, as you well know, that passes Detroit in a given year than there is that floats on the Thames. Passing Detroit, in 1920, there were 80,410,082 tons with a valuation of about \$1,135,000,000 in transit up or down the river.

Of course, we never expect to get any approach to such traffic on the Tennessee River, but we simply point to the Lakes as an example of cheap transportation on a waterway having a definite, dependable channel, where there is something to be hauled at a profit. If we can get the dependable channel we will not lack the cargo to be profitably hauled.

The cost of water transportation on the Great Lakes in 1920 was about 1½ mills per ton-mile. That is about 10 per cent of the cost of freight hauled by rail, and while we do not expect that the cost of transportation on the Tennessee River will be as low as 1½ mills per ton-mile, we do think that it offers a substantial means—a real means—of securing a cheap form of transportation for the Tennessee Valley.

Senator MCKINLEY. Has the Mississippi been under navigation for a hundred years?

Mr. WALDO: No, sir. Not in the sense that we—

Senator MCKINLEY. From St. Louis down, is it?

Mr. WALDO. Yes, sir. There is navigation on the Mississippi, Senator.

Senator MCKINLEY. Was there not a great deal more navigation on the Mississippi 60 years ago than there is now?

Mr. WALDO. There was, and for very good reason, Senator.

Senator MCKINLEY. Why?

Mr. WALDO. Sixty years ago there were no railroads paralleling the Mississippi, with low grades—

Senator MCKINLEY. How are they going to compete with this cheap transportation?

Mr. WALDO. Because there are classes of freight that can go by water that are now being hauled by rail at a disadvantage, and investigations of the Interstate Commerce Commission will show that there are certain classes of freight that are hauled at a distinct disadvantage to a railroad company. Such classes of freight can go by water with advantage. For instance, if you will look behind you there, Senator, you will find a map that shows the marble deposits of the Tennessee Valley, and you will see that the Tennessee River criss-crosses right through those deposits.

Senator MCKINLEY. I was talking about the Mississippi River.

Mr. WALDO. As a matter of general principle, there are certain classes of freight—marble for one, coal, iron, and other ore and timber products, sand, stone, and gravel and the like—which call for a low rate per ton-mile.

Senator MCKINLEY. Is it not a fact that now the Government is spending \$5,000,000 a year on the Mississippi, supposedly for navigation purposes, and taking in \$2,000,000 of freight a year?

Mr. WALDO. That is probably true, Senator.

Senator MCKINLEY. And that river has been in operation 100 years now.

Mr. WALDO. You have to consider what the history has been. You have not had commercial service on your boat lines. That is to say, if you have a factory, Senator, and you want to ship some goods, you can have a car spotted at your warehouse door, and you can put your freight on that car, and you know

It will probably go straight to destination without any serious trouble. The river can not compete with that service unless it can offer some service that is equivalent to the advantages offered by the railroads. That can not be possible without adequate terminals and transfer facilities, and without the legislation that has only recently been passed to compel through bills of lading and physical connections between rail and river. The rivers have not had a chance yet, Senator.

Senator KENDRICK. It is your contention that before there can be real competition in the movement of freight there must be an elimination of all doubt as to the carrying capacity of the river and the connection in transportation, and all that sort of thing?

Mr. WALDO. Absolutely, Senator. You must have a competing service. You must be able to give a warehouse door to warehouse door service, and you have not been able to do that. The old-time boats that Senator McKinley mentions are the kind that used to tie up at any tree. If they had an empty chicken coop to land, it would make no difference whether it cost more to land that chicken coop than it was worth, they would land it just the same. There were no transfer facilities. They would put the goods on the river bank and a rain storm would come along and the goods would be ruined and the shipper would have no recourse whatever. Or a rise in the river would carry away a thousand dollars worth of hay or grain or some other material and the shipper would have to stand the loss. So there has never been a fairly comparable set of conditions between the river and the railroad.

To work out a comprehensive plan for the improvement of the Tennessee River, we must have an adequate survey. Such a survey has been proposed by the United States district engineer at Chattanooga, Maj. Harold C. Fiske.

The objects of this proposed survey are set up by Major Fiske in his request for the appropriation. I will read just a little of it:

"The proposal to make a comprehensive survey of the Tennessee River and its tributaries arises from the belief in the minds of many men who have given this matter careful thought that this basis is rich in undeveloped possibilities industrially and commercially. The industrial future is believed to rest primarily on the large amount of hydroelectric power which is potentially available both on the numerous large streams tributary to the Tennessee, which flow down from the mountains forming the rim of this basin and on the main river itself in its fall of 450 feet in the 430 miles from its source to the foot of Colbert Shoals. Second in importance only to this hydroelectric power, in the minds of these men, are the mineral resources of this region, covering a list of some 20 or 30 minerals known to exist in commercial quantities in this region, none of which have been thoroughly developed and only a few, such as coal, iron ore, marble, zinc, etc., appreciably developed. The commercial future depends in large measure on the transportation facilities by which this region is joined to the rest of the country. Of these, it is commonly accepted that existing railroad facilities are now, or soon will be, inadequate and that future extension on their part is not to be expected for many years to come."

Then, of course, there is the cost of the service that you have to consider. A man never knows, when he establishes a plant whether the actual freight rate on which he is basing his present business is going to be the rate in the future at all. Over night it may be doubled and then what had been, apparently, a successful operation, may become an unsuccessful one.

Senator KENDRICK. May I ask a question there in connection with the freight on the Tennessee River?

Mr. WALDO. Certainly, Senator.

Senator KENDRICK. Is it the plan and purpose of those who have given this navigation matter a lot of thought, to have this freight move right out into the Gulf, or would it have to be transferred from one vessel to another when it reaches the mouth of the Mississippi?

Mr. WALDO. It would have to be transferred, Senator, but that could be done mechanically.

Senator KENDRICK. So that you have no boats on the river, then, that would carry cargoes on the Gulf?

Mr. WALDO. No, sir; not on the Tennessee River. The conditions on the Mississippi River in general are not such as to warrant operating ocean-going boats.

¹ Major Fiske's Report, H. Doc. No. 319, 67th Cong., 2d sess., p. 66.

Senator KENDRICK. At New Orleans they do.

Mr. WALDO. They are planning to operate them as far up as Memphis, but that has not yet been done. As to New Orleans, I am sure you are right, Senator.

Senator KENDRICK. That is an important point in cheapening the general or through rate, if it could be done.

Mr. WALDO. Yes. The people on the Lakes have solved that problem, I think, in a very admirable way. You have probably visited the terminals at Toledo and the lower lake points, and have seen them transfer coal, for instance, from the cars to the barges. They will take a hundred-ton coal car, strap it down to a lifting platform, raise it by electric power, and spill the coal over the side of the car into an apron that connects with a chute leading down into the boat, and so transfer a trainload of coal from the cars to the boat in less than an hour. The whole work of unloading a car of coal is a matter of a few minutes.

The CHAIRMAN. Well, they do that down below Muscle Shoals, over the divide, on the Warrior River.

Mr. WALDO. Yes, sir; but not that way.

The CHAIRMAN. And do not do it that way, but they have mechanical means by which they can unload the coal from the car and put it in the barge or boat without the use of a shovel or any hand labor of any kind, and do it in a few minutes. But when you take it out of the boat and put it in a car, just the reverse operation, or take it out of one boat and put it into another, you have a different problem to solve.

Mr. WALDO. At Lorain, Ohio, for instance, on Lake Erie, they have to unload ore coming there in cargoes of five or six thousand tons, and they have installations all along the lake there which are marvelous to a man who is not familiar with those things. They can unload one of those enormous boats in about six hours by purely mechanical means, of course, using clamshell and orange-peel buckets and electric cranes. If it is small package goods, not bulk freight, then there are other means of doing it, as you have pointed out, Senator. You can put your less-than-cargo-lots goods into containers of sufficient size so that they can be loaded or unloaded by crane directly from the car to the barge.

The CHAIRMAN. We saw those when we were down there over on the Warrior River, where they seem to have developed up to date, large containers that were waterproof and big enough to put a man inside of. They would be filled and loaded on the cars, as I understand the operation.

Mr. WALDO. Yes, sir. Some of them would hold many men.

The CHAIRMAN. And an immense quantity could be put into one of those containers. Then a derrick would lift them off of the flat car and put them into the boat. It is a very simple operation.

Mr. WALDO. Yes, sir. The containers vary in size to suit the shippers' requirements.

The CHAIRMAN. Then they can be lifted off of the boat and put onto a truck or onto another car by a very simple operation.

Mr. WALDO. What we have in mind in connection with the Tennessee River, though, is bulk freight, heavy goods, that take a low freight rate and yield a low profit to the railroad company.

This report continues:

"It is therefore the hope of the local interests that the hydro-electric, industrial, and mineral resources of the Tennessee Basin may be rapidly developed and that as these develop the rivers of this region will be found to be in condition to carry freight between this basin and the rest of the valley of the Mississippi. When private interests seek to develop hydro-electric power in the Tennessee River Basin it is found here, and elsewhere, that questions arise as to the effect which the proposed installations will have on the navigable portions of these rivers, not to mention the ever-recurring question of what are the limits of these navigable portions.

"Furthermore, a large amount of this potential power lies in the Tennessee River itself, an undeniably navigable stream, where to be made available, this power must be developed by the United States or by other interests who have received from the United States certain definite and acceptable rights and privileges. Certain hydroelectric installations have been made in this basin, both on the tributaries above the head of navigation and on the main river itself, where navigation has also thereby been improved; yet it is felt by local interests that the delays, conditions, and uncertainties connected with

such developments have appreciably retarded the growth of this promising industry. It is the hope, then, of these interests that in the course of the proposed survey means will be found, not simply to remove everything in the nature of an obstruction to such progress, but even to facilitate and stimulate such enterprises. Hydroelectric power and native mineral resources suggest to manufacturing industries, and it seems to be expected that the proposed survey will, furthermore, point out a program of possible development which shall include such locations for the prospective plants as will insure the most efficient use of the navigable river system in its complete state of improvement which it is hoped will ultimately be attained. Finally, it is hoped that the information acquired in the course of the proposed survey will be sufficient in quantity and accuracy to enable prospective investors in power for manufacturing plants to dispense with much of the expensive investigation indispensable in launching undertakings in a comparatively virgin territory.¹

I would like to call attention, in this connection, to the size of locks on the Tennessee, and I would like to put into the record a list of these locks, showing a comparison of the sizes.

Comparison of lock sizes, Tennessee River and Ohio River.

[From 1921 Report of Chief of Engineers, United States Army.]

Lock at—	Length (feet).	Width (feet).	Minimum depth on miter sills at low water (feet).	Remarks.
Tennessee River:				
Caney Creek.....	265	60	6.5	Not commenced.
Widows Bar.....	265	60	6.5	Under construction.
Belleville.....	265	60	6.5	Not commenced.
Hales Bar.....	267	60	6.5	Completed.
Riverton.....	287	80	6.25	Completed.
Dam No. 2.....	300	60	7.5	Under construction.
6 locks, Muscle Shoals Canal.....	275	57	2.2- 5	To be abandoned.
5 locks, Muscle Shoals Canal.....	283	57	3.5- 5	To be abandoned.
Ohio River, all locks.....	600	110	9- 11	Standard almost without exception.

The lock at Dam No. 2, for instance, is 300 by 60 feet, with a minimum depth of 7½ feet, but at Riverton, below that point, it is 287 by 80 feet, with a minimum depth of 6½ feet. At Hales Bar, above Dam No. 2, it is 267 by 60 feet, and the minimum depth is 6½ feet. This discrepancy in the locks will be a very distinct disadvantage when it is undertaken to navigate the stream, using self-propelled barges.

The CHAIRMAN. Well, we can not remedy that. I have realized that for some time, and have been looking into it. I first thought it was a very serious handicap. I even thought that we ought to change the plans of Dams No. 2 and 3 and make the locks larger, but I have talked with the engineers about it and they have satisfied me it is not so important as I thought it was. For instance, the object in having a large lock is to put several barges in the lock at once. There will be no boats that will go up and down that river that can not be handled in all those locks. There will be one boat, perhaps, pulling half a dozen barges.

Mr. WALDO. They push five or six small barges of two or three hundred tons capacity.

The CHAIRMAN. When they come to a lock that is big enough to put them all in, they will all go through at once. When they come to a lock that will not take but half of them, they will have to have two lockings. It will take a little longer; that is all. There is not any reason now that would justify the Government in tearing out the locks and putting in bigger ones.

Mr. WALDO. Not now. However, we are simply pointing out the inconsistency in building a variety of sizes of locks rather than determining on a definite, comprehensive plan that looks ahead somewhat, as would be provided by this survey, Senator.

¹ Same reference.

The CHAIRMAN. Of course, that is right, Mr. Waldo. There is no doubt about that. But so much work has been done without any definite plan, and it would have been a lot better before we did anything to have had a comprehensive plan to develop the entire stream. But that has not been done, and we can not help it.

Mr. WALDO. In contrast with that consider the Ohio River, with 54 locks, all of which are 600 by 110 feet. They evidently have a definite plan.

The CHAIRMAN. Yes.

Mr. WALDO. All their boats can be based on 600 by 110 foot locks. If those boats are to be built after the manner of the self-propelled barges of the Mississippi-Warrior service, a boat based on the Ohio River locks could not use the Tennessee River except on the part near the mouth.

The CHAIRMAN. I will ask you this question. You perhaps know, and I don't. Are there any boats now navigating the Ohio and Mississippi that could not pass through the locks that we have started at Dam No. 2?

Mr. WALDO. I do not know of any, Senator. However, the adoption of 600-foot locks in the Ohio River with a 9-foot depth, and not over 300-foot locks in the Tennessee with a 6-foot depth seems to indicate that the Tennessee is hardly receiving due consideration.

The survey which we desire has been recommended by the Chief of Engineers, Gen. Lansing H. Beach. There was great satisfaction throughout the Central West when General Beach became Chief of Engineers. His many friends have felt that here is a man who understands the needs of inland river navigation and appreciates what a real commercial development of river traffic requires and what it will do in building up the industries of a rich and comparatively undeveloped region. He appreciates the fact that power development should go along with navigation improvement wherever possible, and in recommending an appropriation of \$250,000 for continuing the work of the survey General Beach said: "In these days of superpower the direct effect of the power development possible on these streams will reach to every part of the country east of the Mississippi and the economic result will be manifest throughout the entire extent of our country."¹

General Beach's recognition of the importance of power studies in connection with navigation improvement is gratifying to many people who wish to see our navigable streams and their tributaries fully utilized. At Muscle Shoals, and undoubtedly in many other cases, by setting up a long-term sinking fund the water power can be made to pay the whole cost of the navigation structure, Senator. That is the idea of that feature in the Ford proposal: you will amortize not only the cost of your dam, but your locks as well, and ultimately the Government receives its navigation facilities free of cost. We believe that wherever the power development is worth while, if the time of the lease is sufficiently long, an amortization fund can be set up at such low cost that it will not add appreciably to the cost of the power to this generation of consumers, and it will give future generations very cheap power, and also the navigation improvement without cost. Furthermore, the results have not been at all as Colonel Harts predicted. In the Knoxville district, in spite of the great hydroelectric developments, there has been a serious shortage of power rather than any lack of market, for example, there are knitting mills where a long line of girls are employed, and the power goes down suddenly, due to a shortage, because, perhaps, of the local power people having oversold their supply of current. When the power suddenly goes down the operator does not know whether to let these girls go home or to keep them there and pay them without getting any return.

Another man will have cloth passing through a long vat containing dyestuffs; he is depending on a certain rate of procedure through that vat in order to secure a certain color, and the power suddenly is gone and a large part of his cloth is ruined. The expense for power is not alone its present comparatively high cost, but the damage and loss resulting from lack of continuous service.

The examples can be multiplied of those industrial developments up and down the Tennessee Valley depending on hydroelectric power where there has been a power shortage, and right to-day there are people in Knoxville, for instance, who would be very glad to form a company to develop some of these cheaper powers. We would have no difficulty in the world in securing capital for such a purpose, but those interested know and we know that until there is such a survey as this it is useless for them to proceed. The dams are on

¹ H. Doc. No. 319, 67th Cong., 2d sess., p. 3.

navigable streams, and a plan must be worked out in cooperation with the Government covering both power and the navigation features. To say that a strictly navigation survey such as this one of Colonel Harts of 1909 will suffice to-day is to talk nonsense.

On that map before us there is a large blue spot that shows 144,000 horsepower. About 72,000 horsepower of that is already installed on the Little Tennessee River at the Cheoah Dam and the Alcoa project has been started, but has not yet been carried very far. That demonstrates what private capital will do when it does not have to consider navigation. They went to the Little Tennessee River simply because it was not a navigable stream and they would not have to consider Government cooperation. The remainder of those streams, the important ones, are officially declared to be navigable, and until we can have a navigation-power survey by the Government engineers that is of the same character as this Muscle Shoals survey—Document 1262 of the Sixty-fourth Congress, first session—will we be unable to proceed with any plan.

In this connection I would like to read an extract from the hearings before your committee, Senator, on April 11. Col. W. J. Barden, United States district engineer in charge of the Florence district at Muscle Shoals, said:

"Major Fiske tells me that his report is not yet ready for the commission, and this is merely preliminary information he is giving now. He says there are feasible 46 combined reservoir and power dam sites available, each having a draw-down capacity varying from 5,000 to 800,000 acre-feet. The two largest, with capacities of 700,000 and 800,000 acre-feet, respectively, are located on the Clinch River, and he thinks that if their draw down were properly regulated in the interest of the Muscle Shoals dams, the minimum flow, and therefore the primary power, would be about doubled for an average year."

The CHAIRMAN. Where is that on this map?

Mr. WALDO. It is here at these upper river Dams Nos. 3 and 5. Senator. Dam No. 3, with reasonable expense, could be built up to a height of 235 feet and eliminate Dam No. 2. That would give a storage of some 222,000,000,000 cubic feet, or about 5,100,000 acre-feet, according to the preliminary studies that we have made. If that Dam No. 3, together with the one on the Holston numbered 5 and the one on the Hiwassee numbered 17, were built, there is no doubt whatever that the primary power can be doubled at Muscle Shoals, and probably more than doubled.

The CHAIRMAN. Are those water-power propositions or purely storage?

Mr. WALDO. Those are water-power propositions, because they are on navigable streams, and there is a certain amount of water which must be allowed to flow continually and, that being true, of course the logical thing to do is to install hydroelectric equipment at the dams and generate power for local purposes. Knoxville is especially interested in this because that is a chance to get additional power in that section.

The CHAIRMAN. Now, that is interesting. You want Mr. Ford to have this. Knoxville won't get any power from Muscle Shoals if Ford gets it.

Mr. WALDO. Probably not.

The CHAIRMAN. Because Ford is going to use it all himself. You say Knoxville would get power if you developed Dam No. 3?

Mr. WALDO. Undoubtedly, Senator.

The CHAIRMAN. But if we give it to Ford, like you want us to give this to Ford, Knoxville would not get any power then from Dam No. 3, would it?

Mr. WALDO. I don't see why not, because—

The CHAIRMAN. How far is Knoxville from Dam. No. 3?

Mr. WALDO. Twenty-five miles, air line.

The CHAIRMAN. Exactly. Now, if we give away the power at Dam No. 3, up there in the headwaters up there, on the same basis that you are wanting us to give this away at Muscle Shoals, Knoxville would not get a horsepower.

Mr. WALDO. This Clinch River Dam No. 3 would come under the water power law, Senator.

The CHAIRMAN. But he could build another city up there like Ford is going to build, and go into his own business, and the people would not get any of it.

Mr. WALDO. No, sir. Let me make this statement: At Muscle Shoals we have a peculiar condition. We do not have the ordinary water-power proposition. Mr. Ford is undertaking, over a period of a hundred years, to do certain things that the ordinary water-power development does not undertake to do.

The CHAIRMAN. What is it?

Mr. WALDO. He is undertaking to maintain the nitrate plant, absorbing all the depreciation himself, during a period when the plant will have to be re-

built probably four or five times. He is undertaking to manufacture to the full capacity of that plant nitrogen fertilizers and other commercial fertilizers that will call for phosphoric acid and potash in sufficient quantities to make up a commercial fertilizer mixture.

The CHAIRMAN. He does not agree to do that.

Mr. WALDO. I will read this paragraph, Senator.

The CHAIRMAN. I don't think it would be very material even if he did, however, because that is taking all the power away from any city that may want it, absolutely. But, of course, the power at Muscle Shoals to operate nitrate plant No. 2 is very small as compared with the immense amount of power that is going to be developed at those two dams.

The point I wanted to call your attention to was that at Muscle Shoals, if Ford's offer is accepted, while it would be a great thing for the people who own the lots and the real estate to sell it and for the people in the immediate vicinity, because it will build up a city—I think, without any doubt, a great manufacturing center—all the electricity developed there, except what is used to run nitrate plant No. 2, is Ford's—all of it.

Mr. WALDO. Such as it is, and under restrictions.

The CHAIRMAN. And he is not going to sell it to anybody. There is no restriction about the electricity that he has.

Senator HEFLIN. Let him read that clause.

The CHAIRMAN. Now, the contest on that point of it is between the idea of giving the power all to one man to use in the manufacture of anything he wants to go into, and the other idea that when we develop power on a navigable stream it ought to be given more directly to the people, like cities and towns, and carried on to New Orleans and Little Rock, Ark., and all such places as that.

Mr. WALDO. I appreciate your point, Senator, but I want to set up the other side. It never has been set up, and I don't believe it is understood.

The CHAIRMAN. I would be very glad, of course, to have you make any argument you want to on that line, but, Mr. Waldo, there are two ideas, now, on this question of power development, and I am not condemning either one. For instance, the complaint is made now in Buffalo that the people of Buffalo, the householders—and one great advocate of Ford was always talking about the washerwoman getting power to run her washing machine—are talking and complaining that they are living near enough to hear the water roll over the falls, and they get no benefit from it themselves, and they use electricity made by coal that is hauled in hundreds of miles on the railroad.

Mr. WALDO. Yes.

The CHAIRMAN. That has been given to manufacturing concerns. It has helped them and it has helped the country. I will admit that. But the question is whether it would not have been a greater benefit—at least, this other school believes it would, and I confess I am a member of it—instead of turning it over to one man or one set of men to use in their private business to have it distributed all over the country, because it belongs to all the people and ought to be carried just as far as electricity can be carried.

Mr. WALDO. What is the best way to carry it farthest, Senator, by wires?

The CHAIRMAN. By wires.

Mr. WALDO. I can't agree with you, Senator.

The CHAIRMAN. If there was a better way, I would like to see it carried that way.

Mr. WALDO. Suppose you are able to put that into concentrated fertilizers, and suppose you are able to carry that long distances, far beyond the range of the economical electric transmission. Are you not benefiting to a far greater extent the population of this country than you are merely to distribute it over a limited territory of 300 miles radius or less.

The CHAIRMAN. You will put some of it into fertilizer, probably, at Muscle Shoals?

Mr. WALDO. Two hundred thousand horsepower, in all probability, Senator.

The CHAIRMAN. No, not that much; less than 100,000, under Ford's offer. That is all that the Government would probably put in if it operated it. I am not complaining about that. And it would do lots of good. I am not complaining about that. That is going to be done down there, I suppose, no matter who handles it, because it belongs to the Government and must be kept as a war preparation, and the question is how we can use it best in time of peace. That limitation will probably be put on anybody, whether the Government does it or anybody else does it. I do not suppose that Congress would ever

give that up, because we need that. We need to operate that plant if war should break out, and we want to use it in time of peace to make fertilizer.

Mr. WALDO. Yes, sir.

The CHAIRMAN. Now, outside of that, in Mr. Ford's offer he owns all of the electricity that is developed.

Mr. WALDO. But what kind of electricity is it? It is electricity that, to be made useful, will call for the large expenditures of his own personal funds, because it is of such an irregular and unreliable nature.

The CHAIRMAN. Certainly. That same thing applies to Niagara Falls. In order to make it useful those men who buy it put in millions of dollars in the erection of machinery.

Mr. WALDO. But not to regulate the flow of the stream, Senator. Mr. Ford must invest millions in equipment, and the other millions in regulation works to stabilize the stream flow. In the Niagara River the minimum flow is 80 per cent of the maximum flow. In the Tennessee River at Muscle Shoals the minimum flow is about 1.4 per cent of the maximum flow. The conditions are not the same at all.

The CHAIRMAN. But the people, the ordinary folks, are complaining about it now because they feel as though that is a national proposition, and they ought to get it directly to use to light their homes and run their washing machines and ironing boards.

Mr. WALDO. That is not our viewpoint of it.

Chrome steel, that makes possible high speed lathes and increased output in our factories is an important thing, Senator; so are artificial quick-cutting abrasives such as carborundum and alundum; so is aluminum, chlorine, bleaching powder and the 60 or 70 other products of electro chemistry and electric furnace metallurgy. Those are key industries, Senator. As a national policy, unless we build up those key industries we are going to let other nations get ahead of us in a very vital matter in time of war. Our attitude is that the woman with the washing machine has a place in the national program, but not the place nor the claim that the electric furnace has.

The CHAIRMAN. The woman with the washing machine has a place on the program, but she has got to pay for it at a high rate. She has got to use electricity made from coal to run her washing machine.

Mr. WALDO. How much does that amount to to her in a year's time compared for instance, with the annual fertilizer expenditure of an average fertilizer-using farmer, Senator?

The CHAIRMAN. I am assuming that we are going to make fertilizer. That is needed. The Government is going to do that. But I am only taking the point as to the excess that is left after that is done.

Mr. WALDO. All right.

The CHAIRMAN. The power that is going to be used to make fertilizer will not be one-fourth or one-fifth of the power that is going to be developed, if we utilize the power in the Tennessee River as I think we ought to.

Mr. WALDO. I am not so sure as to that. On the other hand, Mr. Ford utilizes Dam No. 3 and this Dam No. 5 in connection with Muscle Shoals, although they do not appear in his offer, and they would not come in under a special act of Congress, as Muscle Shoals does, but they would come in under the ordinary water power law, and the power rights would have a life of 50 years. It would come under the regulations of the State of Tennessee and would be distributed to the industries of that section, with the idea that by doing so Mr. Ford can get cheaper power at Muscle Shoals. Under the water power law what would happen? Every downstream improvement that benefits by a head-water improvement has to bear its fair share of the cost of the head-water improvement. The Muscle Shoals project would have to bear its share; Hales Bar would have to bear its share; Chattanooga, which receives a distinct benefit because of floods and I would like to put into the record the record of floods at Chattanooga, because Colonel Harts declares that there are no questions of flood control on the Tennessee River that call for consideration), would have to come in and bear its share, and the local power generated would have to bear its share. Combined in that way, they would have a very much less expense than what any one of them would have to bear if making such a development individually.

Tennessee River at Chattanooga, Tenn.

"April, 1886, Chattanooga city was surrounded by water; fifth ward almost entirely submerged; waterworks shut down owing to flood extinguishing the fires. Both gas works suspended operations and business of all kinds was suspended. Several persons were drowned and many on the outskirts of the city had their homes washed away. Gauge height 52.1. Danger point on gauge, 33 feet.

"March, 1899, flood warnings were also sent to all points as far as Cairo and given the widest possible distribution. On the morning of the 20th Knoxville reported a rise of 10 feet, reaching 27.4. This indicated that the river at Chattanooga would reach 42 feet by the morning of the 22d. The forecast was prepared accordingly and all persons interested were notified to move their goods. Persons moved out of their houses on the 20th—all merchants and factories having goods under the 40-foot mark moved them at once on advice from the office, etc. As far as can be ascertained the amount of property saved as a result of the warnings given was something over \$200,000." (Etc.) (Extract from record of United States Weather Bureau.)

NOTE.—The Weather Bureau officer in charge of flood records estimates that the damage done is never less than three times the value of the property saved as a result of their warnings.

"Twice within less than a year a large part of the city has been flooded. Unless some steps are taken to prevent such floods, Chattanooga's future as an industrial city will be destroyed." (Chattanooga-Hamilton County Flood Prevention Association, 1917.)

DEPARTMENT OF COMMERCE,
OFFICE OF THE ASSISTANT SECRETARY.
Washington, July 5, 1922.

Mr. W. G. WALDO,
205 Third Street SE., Washington, D. C.

DEAR MR. WALDO: Referring to our discussion on floods of the Tennessee River as to their damage at the various cities, I prefer to confine my confirming remarks to one single city of industrial importance, namely, Chattanooga, where I have lived for something over 20 years, and can speak from first-hand experience.

From the table of floods as compiled by the Engineer Corps, United States Army, attached hereto, you will have observed that they reckon the flood stage at 33 feet, which they designate as the "danger point," and that there have been 28 such floods from the time the Government began keeping records of this stream in 1867 to January 24, 1922 (there have been at least two since the latter date, but they are not shown in the figures of the War Department yet available). You will also note that speaking of comparatively modern times, namely, December, 1901, to date, there have been 12 such floods. In other words, for the whole period, or in a 20-year period, they are shown to recur at the short intervals of only two years.

You ask particularly regarding the 1917 flood, when the river reached a stage of 47.7 feet, and effect of this flood at Chattanooga. First of all, let me call your attention to the attached table again, from which you will observe that in

every instance these floods occur at the worst possible season of the year, viz, between December and April at the latest, and chiefly in the coldest months of the year when the greatest amount of misery and privation is caused to those who are driven from their homes.

In this 1917 flood, which was accurately predicted some days ahead by the Weather Bureau, the mayor of the city organized leading citizens into a flood relief committee, on which the writer served in raising tens of thousands of dollars for such relief. The headquarters were in the city hall, which was kept open night and day for many days, and from which were dispatched in the early days all the automobiles and trucks of the city, which were drafted from private ownership to the rescue work. As the flood increased these were necessarily abandoned in favor of launches, improvised boats and rafts, with which the rescue work was continued. All of the public schools and principal churches were thrown open to house the tens of thousands of refugees. There mattresses, so far as possible, and food were supplied throughout a number of days and nights. It was, of course, impractical, except in a few cases, to move the furniture and heavy belongings, most of the effort being directed to the actual rescue of persons and of their immediate needs, such as clothing, leaving in most cases the complete house furnishings, such as rugs, pianos, and furniture generally, all of which were entirely submerged by water, and, worse yet, caked with mud when the waters receded.

It is impossible to put a money value on such damage because quite generally manufacturers and other business men, as well as private citizens, have such a strong civic pride that these things are kept quiet because of the competition between cities.

As a result of this flood, however, the city jointly with civic bodies, such as the chamber of commerce, employed eminent civil engineers to study the problem, and this organization has estimated that in the case of the 1917 flood there were 8,000 homes submerged (in hundreds of cases which I have noted myself nothing but the chimney being visible). Allowing the usual census multiple of five persons per home, this would seem to indicate that in that flood 40,000 people were driven from their homes. Without trying to put it into dollars you can figure for yourself in the case of your own home what it would cost if the house stood for from three to five days under water, with the loosening of the plaster and other destruction to the building, not to talk of its furnishings.

There should also be borne in mind the fact that such floods cause almost complete suspension for railroad service in or out of the city, and interference to United States mail, of course, paralyzing the deliveries of mail and suspending delivery of food, supplies, etc.

It is estimated that there are 20,000 wage earners in the city and suburbs, and if their average wage were \$3 per day this would mean a loss in wages of \$60,000 a day.

Chattanooga is credited with an annual value of manufactured products of \$124,000,000, which equals \$413,000 per day. Hence the loss to manufacturers for a five-day flood would be about \$2,000,000.

Such figures, of course, do not include actual damage by flood, such as by spoiled materials—raw, in progress, or finished—nor the enormous damage to machinery and equipment, nor undermining of buildings and other structures, etc. For example, in the 1917 flood the direct financial loss to the O. R. Andrews Paper Mills Co. due to spoilage of raw material was stated to be \$65,000, and I recall another manufacturer whose similar loss was \$100,000. But, as I have said above, accurate figures are difficult to obtain, because of the universal feeling that it is disastrous to the city to advertise to competing cities what the effects of these floods are.

Much could also be said about the pitiful effects on those farmers in the adjacent territory who are unorganized and unable to give voice to the extent of their damage and misery; but if you had been through one of these floods and had seen the frantic efforts to remove chickens, cows, pigs, and other live stock on improvised rafts to places of safety, you would realize the privation and trouble caused these people, especially when you consider the difficulty of arranging to feed and care for such live stock during the entire period of a flood.

With regard to health, the sewers of the city, of course, empty into the river, and at these extreme stages are put out of commission, resulting in the effluent being washed back and deposited over the area that is inundated. Serious con-

sequences to the community are only avoided by the most drastic rules of the health department, which forbid reoccupation of homes until they have been limed and other precautionary measures carried out; but this denial to property owners to reenter their premises is an additional hardship, most easily comprehended when you consider the season of the year and what it means in families where sickness is present, etc.

Herewith I attach an aerial photograph made by the local street railroad system at the time of the 1917 flood, from which you will note that fully three-fourths of the city was under water at a stage of 47.7. If you will now consult the table compiled by the Engineer Corps, you will see that in 1867, in 1875, and in 1886 there were much higher floods, ranging from 52.1 to 57.7. Of course, in those days the city was a mere village, but it is unpleasant to contemplate what would be the loss in life and property, if there should be a similar flood, based on the present population.

If I can serve you further in this connection, let me know.

Sincerely yours,

PAUL J. KRUESI.

If I may at this time, I would like to put in paragraph 15 of the Ford offer, in regard to the manufacture and distribution of commercial fertilizers to the farmers.

The CHAIRMAN. All right.

Senator KEYES. Paragraph 15 of the Ford offer?

Mr. WALDO. Yes, sir.

"15. Since the manufacture, sale, and distribution of commercial fertilizers to farmers and other users thereof constitutes one of the principal considerations of this offer, the company expressly agrees that continuously throughout the lease period, except as it may be prevented by reconstruction of the plant itself, or by war, strikes, accidents, fires, or other causes beyond its control, it will manufacture nitrogen and other commercial fertilizers, mixed or unmixed, and with or without filler, according to demand, at nitrate plant No. 2 or its equivalent, or at such other plant or plants, adjacent or near thereto as it may construct, using the most economical source of power available. The annual production of these fertilizers shall have a nitrogen content of at least 40,000 tons of fixed nitrogen which is the present annual capacity of nitrate plant No. 2. If during the lease period said nitrate plant No. 2 is destroyed or damaged from any cause, the company agrees to restore such plant within a reasonable time to its former capacity, and further agrees:

"(a) To determine by research whether by means of electric-furnace methods and industrial chemistry there may be produced on a commercial scale fertilizer compounds of higher grade and at lower prices than farmers and other users of commercial fertilizers have in the past been able to obtain, and to determine whether in a broad way the application of electricity and industrial chemistry may accomplish for the agricultural industry of the country what they have economically accomplished for other industries, and if so found and determined to reasonably employ such improved methods.

"(b) To maintain nitrate plant No. 2 in its present state of readiness or its equivalent for immediate operation in the manufacture of materials necessary in time of war for the production of explosives."

Senator HEFLIN. Is that the part you spoke of reading a while ago?

Mr. WALDO. Yes, sir. I will not read it all. It simply provides that Mr. Ford is to manufacture nitrogen and other commercial fertilizers, mixed or unmixed, and with or without filler, according to demand. If the farmers demand a 2-8-2 fertilizer, which is a customary mixture, that calls for four times as much phosphoric acid as nitrogen, and as Mr. Ford must produce annually at least 40,000 tons of nitrogen, he must be prepared to manufacture 160,000 tons of phosphoric acid.

The CHAIRMAN. I concede that, and I have an idea he will do it; but there is not anything in that that compels him to do it. "According to the demand." Who is going to determine what the demand is? I do not care to argue it now, but there are a thousand ways in which this corporation, not Ford, but the corporation after Ford is dead, 25 years from now, can get around that provision. This corporation will say there is no demand. "We will make the nitrogen. We comply technically with the contract." That is all we can expect them to do.

Mr. WALDO. But it says, "and other commercial fertilizers according to demand"—of the consumers, of course.

The CHAIRMAN. Yes; it says, "other commercial fertilizers"; but if they make this nitrogen they say there is not any demand, and who is going to say whether there is a demand or not? They can say, "We will turn this over to somebody else, and somebody else will make it into fertilizer," and that may prove very satisfactory. I do not say that it will not. I am not making complaint about it. I am only calling attention to the fact that it is too general, as there are a good many things in Mr. Ford's proposition, and when you come to dealing with the corporation, as we will have to deal, they will take advantage—and we can not complain if they do—of every technicality that may be in it.

Mr. WALDO. Paragraph 16 goes on to set up an organization to see to it that these fertilizer obligations shall be carried out.

The CHAIRMAN. That is the paragraph which says there shall be a board?

Mr. WALDO. Yes, Senator.

"16. In order that farmers and other users of fertilizers may be supplied with fertilizers at fair prices and without excessive profits, the company agrees that the maximum net profit which it shall make in the manufacture and sale of fertilizer products shall not exceed 8 per cent of the fair actual annual cost of production thereof. In order that this provision may be carried out the company agrees to the creation of a board of not more than nine voting members, chosen as follows: The three leading representative farm organizations, national in fact, namely: The American Farm Bureau Federation, the National Grange, the Farmers' Educational and Cooperative Union of America, or their successor or successors—said successor or successors to be determined, in case of controversy, by the Secretary of Agriculture—shall each designate not more than seven candidates for said board in the first instance, and thereafter, for succession in office, not more than three candidates. The President shall nominate for membership on this board not more than seven of these candidates, selected to give representation to each of the above-mentioned organizations, said nominations to be made subject to confirmation by the Senate, and there shall be two voting members of said board selected by the company: *Provided*, That not more than one shall be nominated by the President from the same State; that if the Senate shall not confirm all of said seven nominees the President shall send additional names from the said list of candidates until the Senate shall have confirmed seven: *Provided further*, That if either or any of said farm organizations, or its or their successors, by reason of the expiration of its or their charter or ceasing to function or failing to maintain its organization or for any cause or reason should decline, fail, or neglect to make such designations, then the Secretary of Agriculture shall make such designation or designations for such or all of said organizations as may so decline, fail, or neglect to make such designation; and if such designation is made by the Secretary of Agriculture for only one or two of said organizations, then such designation shall be made so as to give the remaining organization or organizations the same right and in the same proportion to designate candidates for said board as in the first instance and just as though all of said organizations were making such designations: *Provided, however*, That a failure to make designations at any one time shall not thereafter deprive any organization of its original rights under this section: *And provided further*, That the terms of office of the first seven candidates nominated by the President and confirmed by the Senate on the designation of said farm organizations shall be as follows: Two for a period of two years, two for a period of four years, and the remaining three for a period of six years, and thereafter the nominations for membership on said board made by the President, except for unexpired terms, shall be for six years each. None of the members of said board shall draw compensation from the Government, except that any which may be nominated and confirmed on the designation of the Secretary of Agriculture under the provisions hereof shall receive from the Government their actual expenses while engaged in work on said board. A representative of the Bureau of Markets, Department of Agriculture, or its legal successor, to be appointed by the President, shall also be a member of the board serving in an advisory capacity without the right to vote. The said board shall determine what has been the cost of manufacture and sale of fertilizer products and the price which has been charged therefor, and, if necessary for the purpose of limiting the annual profit to 8 per cent as aforesaid, shall regulate the price at which said fertilizer may be sold by the company. For these purposes said board shall have access to the books and records of the company at any reasonable time. In order that such fertilizer products may be fairly distributed and economically purchased by farmers and other users thereof, the

said board shall determine the equitable territorial distribution of the same and may in its discretion make reasonable regulation for the sale of all or a portion of such products by the company to farmers, their agencies, or organizations. If and when said board can not agree upon its findings and determinations, then the points of disagreement shall be referred to the Federal Trade Commission (or its legal successor) for arbitration and settlement, and the decision of said commission in such cases shall be final and binding upon the board.

The CHAIRMAN. And the Farm Bureau and the Grange and some other farm organizations are going to nominate representatives or suggest them to the President.

Mr. WALDO. Yes, sir.

The CHAIRMAN. To my mind, I would have thought a great deal more of Mr. Ford's offer if he had omitted that. I think it can not be considered to be anything else than a bid to those fellows in Washington who represent these farm organizations to get their organizations behind Ford's offer, and that is just what has happened. And when you think this is to last a hundred years, the idea of the Farm Bureau existing for a hundred years, or even the National Grange! The probabilities are that they will be out of existence in 10 years. They may live for a hundred. That would be the object of this great corporation owned by Wall Street in a few years after Mr. Ford died. They would have possession of these farm organizations overnight. To my mind it is worse than nothing to put that in there, because we can not conceive of what these organizations are going to be in 50 years from now or a hundred years from now.

Mr. WALDO. I will agree that perhaps not one of the three organizations, whose representatives constitute the majority of the board, will live 100 years. But they will have successors. That means that Mr. Ford's company deals, not with this or that particular farm organization, but with organized agriculture, the permanence of which there can be little doubt, for whatever else fails in this country agriculture must not fail, whatever happens. Furthermore, if there is no regulation whatever, then how are you to be assured that the profit is limited to 8 per cent?

The CHAIRMAN. I think that is a very proper thing to consider, but it seems to me that to do a thing of that sort would not mean certainty, but it would be as near as we could come to it. If we wanted to provide for that, it ought to be under the jurisdiction of some governmental authority that we know is going to stay as long as the Government exists, unless we change our form of government.

Mr. WALDO. I am willing to leave it to the farmers, Senator. Without taking the time to read this, I wish to put into the record what General Beach has to say with regard to these reservoirs and what might be accomplished by them.

"General BEACH. Every dam that is built on the upper Tennessee which will restrain the flood waters and let them out gradually during the low-water season will increase the primary power at Dam No. 2, with a corresponding decrease in the secondary power. Mr. Ford has said that if he obtained the lease of this property at Dam No. 2, or the lease of the property according to his proposition, he intends to come in and make application for other dams on the upper river and develop them up there above with the idea of utilizing the power which he can obtain from them and increasing the value of the power which he has made arrangements to obtain by his offer at Dam No. 2. That one feature of the case alone appears to me to be worthy of the most careful consideration by Congress, for I believe that the leasing of Dam No. 2 to Mr. Ford will be followed by a development along the Tennessee River which would be very material, and would probably amount in a few years to more than you would get in any other way in the course of a generation or two."¹

The CHAIRMAN. All right.

Mr. WALDO. Then I want to follow that with what Major Fiske, the district engineer, hopes to accomplish by means of these same reservoirs. We all know what is expected to be accomplished.

"Existing information indicates that by building the two dams on the Clinch River, which give the maximum storage of any possible in this basin, the primary power at Muscle Shoals might be doubled, and that by building still other dams on various tributaries the primary power at Muscle Shoals might be brought up to nearly three times what seems possible under present condi-

¹ House Hearings on Muscle Shoals Propositions, 67th Cong., 2d sess., p. 104.

tions. There is already one power-navigation dam in operation on the Tennessee River and others seem to be worthy of serious consideration.

"It is to be remembered that these dams on tributaries permit the generation of power at their own sites, the increase of primary power at Muscle Shoals, and also a similar increase at from one to all of the other power-navigation dams which may be built on the Tennessee proper. For instance, the water stored on the Clinch River would generate power there, and in addition, if future investigation should remove a variety of known obstacles of unknown seriousness, the same water would participate six times in the generation of power at as many different power-navigation dams before reaching the turbines in the Muscle Shoals section."¹

The CHAIRMAN. Is that in this report which has not yet been printed?

Mr. WALDO. That has not been printed; no, Senator; I have the proof sheets.

The CHAIRMAN. I have not seen it, and it is very interesting to me, because it is the one study that, it seems to me, we lack in order to legislate properly on this whole thing. I agree with you entirely that we ought to consider it all, and that that is very important, because it will lessen the cost of power a great deal if it is practical to build those dams. Does the report recommend the building of those dams?

Mr. WALDO. The report recommends a thorough investigation of them, and the Chief of Engineers recommends an authorization of \$515,800 and a present appropriation of \$250,000 for this investigation and survey.

The CHAIRMAN. Has the examination gone far enough so he gives an estimate of the cost?

Mr. WALDO. He does not, Senator.

The CHAIRMAN. He does not do that?

Mr. WALDO. No; he does not do that.

The CHAIRMAN. It is just a preliminary?

Mr. WALDO. That is all. I have been on the ground and I know there is no such undertaking required as at Muscle Shoals. The dam, for instance, at the site indicated at No. 3 would be about 1,500 feet long on top, but the base, where the greatest thickness of the cross section is required, would be only about 300 feet long.

The CHAIRMAN. That is on the Tennessee proper, is it not?

Mr. WALDO. That is on the Clinch River, just below the mouth of the Powell River.

The CHAIRMAN. Where does the Clinch River flow into the Tennessee?

Mr. WALDO. Just below the point marked 4 on the map, at a place called Kingston, Tenn.

The CHAIRMAN. And Knoxville is between Dam No. 2 and—

Mr. WALDO. Knoxville is that large red spot on the map.

The CHAIRMAN. Is the Clinch River navigable?

Mr. WALDO. Yes, sir. That is, it is declared to be a navigable stream.

The CHAIRMAN. I do not have any idea that there is much navigation up there. Is not that pretty well up in the mountains?

Mr. WALDO. Yes, sir. Navigation in fact is quite a different matter.

Senator KEYES. I think the water power commission considers any stream that will float logs a navigable stream.

The CHAIRMAN. It would probably have to go through the formality of putting in locks, then?

Mr. WALDO. That is a question that would have to be decided. The Army engineers would say as to that. I expect that it would be a good thing.

The CHAIRMAN. How high would that dam have to be? Does he recommend it, or does the survey recommend the height?

Mr. WALDO. This report gives certain heights for the dams and the capacities for the given heights. A dam at site No. 3, for example, 175 feet high would have a storage capacity of about 64,000,000,000 cubic feet, but if carried up another 60 feet you would increase it from 64,000,000,000 to 222,000,000,000, and by far the greater part of the area that you would cover is cut-over timber, and is not agricultural land.

The CHAIRMAN. How is it settled?

Mr. WALDO. It is very sparsely settled.

The CHAIRMAN. Is there any town up there?

Mr. WALDO. The town of Clinton just below the site of dam No. 3 is the nearest town.

The CHAIRMAN. That would be flooded, the whole town?

Mr. WALDO. No, sir; There would be no damage to towns whatever.

The CHAIRMAN. There would not be?

Mr. WALDO. No, sir.

The CHAIRMAN. I should think it would be a practical proposition, then.

Mr. WALDO. Everyone has considered that it probably would, Senator.

The CHAIRMAN. That dam No. 3 would back the water up in two rivers?

Mr. WALDO. Yes; both the Powell and the Clinch, nearly up to the Kentucky line.

The CHAIRMAN. How many miles?

Mr. WALDO. I judge possibly 45.

Let us consider for a moment the cost of primary power to Mr. Ford if he does not do this thing. There is nothing in his offer here that compels him to do this. Just why should we expect him to do it?

The CHAIRMAN. There is not anything in his offer that even mentions it.

Mr. WALDO. Why should he be expected to do it, then? Colonel Barden, in his testimony, indicated that the primary power at the two dams at Muscle Shoals totals 121,000 horsepower. He gives the estimate of the cost of completing those dams as \$50,000,000.

The CHAIRMAN. How much primary horsepower?

Mr. WALDO. One hundred and twenty-one thousand. That is 87,000 at dam No. 2 and 34,000 at dam No. 3.

The interest on that investment of \$50,000,000 would be, at 4 per cent, which Mr. Ford agreed to pay (on whatever amount the cost may be), \$2,000,000. He has also a maintenance fund of \$55,000 and an amortization fund of \$46,547, making a total of \$2,101,547. Now, if he is able to realize a 100 per cent load factor; that is to say, if he can use all the power all the time, the cost of that power, calculated only on those items, would be \$17.36 per horsepower year. But no one can attain a 100 per cent load factor. If he can build up a load factor of 70 per cent; that is to say, use 70 per cent of the power, the cost of the power that he uses would be \$24.80 per horsepower year. That is not specially cheap power. That is not the kind of power that would give cheap fertilizer.

The CHAIRMAN. You have considered nothing but primary power?

Mr. WALDO. Yes, sir; but secondary power is an entirely different matter and the statement has been made by the southeastern power companies that even the 10-month secondary power is without commercial value. I am not going to say that it is entirely without commercial value, but it must be supplemented in some practical way, and a large investment must be made to make it commercially useful.

The CHAIRMAN. I do not think it is seriously contended that it is all without commercial value and, on the other hand, it is not seriously contended that it all is of commercial value. Some of it is almost as valuable as primary power.

Mr. WALDO. If you can stabilize that power so that it is there during certain definite periods of the year, then you have a valuable secondary power; but if it is there one week and gone the next week, varying with the unregulated flow of the river, then, of course, it is not of value.

The rental cost of that primary power would then be about \$4.80 more than the total cost of Niagara power at the Falls plants; but Mr. Ford must now add the operating cost of making the power, which would bring the total cost to something over \$27 per horsepower-year. This is not cheap hydroelectric power. Even the steamplant will produce power at about \$26 per horsepower-year with reasonably priced coal. So it all comes down to how much of the secondary power can be utilized, and in order to utilize his secondary power it must be made reliable; that is to say, he must be able to depend on it over a certain season of the year, and in order to accomplish that he would have to operate steam plants for one thing, which adds seriously to the power cost, and build these storage dams for another thing, which promises to be much more economical, and interconnect that power down there with other sources of power in the Southeastern States, which is another way, although at present a limited way of building up secondary power. Therefore there is the strongest business reason for Mr. Ford to do this thing. The cost of those dams, while not computed, is very obviously much less than he could afford to spend to double the

amount of his primary power at Muscle Shoals; and, of course, the building of Muscle Shoals Dam No. 3 gives him just 38 feet more head over which to use the water which he conserves with those storage dams.

The CHAIRMAN. I have always felt, Mr. Waldo, that no private individual would bind himself to build these storage dams unless he intended to utilize and build enough dams on the river between the storage dams and Muscle Shoals so that he could get the benefit of his expenditure, and Mr. Ford has not agreed to do that. I do not believe he will do it, because it seems to me there is only one power in the world that can afford to do that, and that is the Government. It is true that if he should build a storage dam and somebody down below would build a dam for power purposes, under the water power act they would have to contribute their proportion.

Mr. WALDO. There is one dam already there, Senator, at Hales Bar.

The CHAIRMAN. Oh, yes; there is one; but there are places for a whole lot more. There is more power to be developed along the river.

Mr. WALDO. Oh, yes; certainly.

The CHAIRMAN. Private individuals can not be expected to go up and build reservoir dams, because they have to wait to get any return out of it for other people to develop power between them and Muscle Shoals. The Government could afford to do that, then everybody who built under the law any dam between would have to contribute to the Government part of the expense.

Mr. WALDO. I think Mr. Ford would be very glad if the Government would build those storage dams, Senator.

The CHAIRMAN. My idea of it is that the Government ought to do it, because you can not expect a private person to do it, because he may have to wait 25 years before somebody else develops more power, and men will not invest their money to do that. The Government can afford to do it, and as soon as the Government does do it it will be the greatest inducement for other people to come in and build power dams and take them under the water power act, because they will get a great deal better and cheaper power that way than they would if these dams are not constructed.

Mr. WALDO. However, Senator, Mr. Ford is interested, assuming that he has Muscle Shoals. The fact that he can get 140,000 additional primary horsepower by building these dams would make him rather impatient if the Government should lose time in going ahead with the proposition.

The CHAIRMAN. The Government is not going to do it if it accepts Ford's offer, of course, because it has no direct interest in it then. The Government, of course, will not build those dams then.

Another reason why it ought to be done is that it is fair to assume that this flowage right will cost more in the future than it will now. The country will settle up and land will become more valuable, and therefore the expense will be increased and may be increased to such an extent that it is not a practical thing to go ahead with. The Government itself could go ahead and do it all at once, even if it had to wait a while for a return on some of its money, and thereby bring about great development of the entire stream, and it would be a good thing to do, but I don't know how any private individual could be expected to do it. Nobody has offered to do it. Mr. Ford would not think of binding himself in his contract to do it. We could not expect him to. I myself would not expect him to do it, and I don't believe he ever would do it.

Mr. WALDO. Senator, he has the best kind of business reasons for doing it, and his chief engineer, Mr. Mayo, has testified that he is prepared to spend \$50,000,000, if necessary, to carry out his end of this plan, and it requires only a fraction of \$50,000,000 to build those dams.

The CHAIRMAN. I took his statement to mean that Mr. Ford would spend \$50,000,000, including factories at Muscle Shoals, where that city is going to be built.

Mr. WALDO. Well, he had in mind these dams up here, Senator.

The CHAIRMAN. I don't think he had.

Mr. WALDO. Mr. Mayo has told me that he did have.

The CHAIRMAN. He did?

Mr. WALDO. Yes, sir.

The CHAIRMAN. Well, that is another thing. Can Mr. Ford speak for the corporation after he is dead—that it will do it?

Mr. WALDO. Well, sir, I expect that there are some elements of risk in the Ford offer, and one of them is that Mr. Ford may die right away; but if Mr. Ford lives, we will say, another 10 years, if you please—

The CHAIRMAN. I think that is a fair assumption to say that he would live 10 years.

Mr. WALDO. All right, sir. Then under those conditions I think it would be a fair expectation that these improvements will be put in.

The CHAIRMAN. Well, Mr. Waldo, in 10 years; if this proposition were accepted to-day, it would be 10 years before the thing would be in full swing.

Mr. WALDO. I agree with you, as to the whole storage project.

The CHAIRMAN. If we accept Mr. Ford's offer to-day, it will be 10 years before the factories begin to operate in good shape and are well organized.

Mr. WALDO. Well, sir, I have seen something of the way they do things there at the Ford plant, and 10 years is a long time in the history of the Ford organization.

The CHAIRMAN. Yes; I admit that. I have great respect for him. I think he has built up a wonderful organization.

Senator HEFLIN. His friends say if he gets this proposition he will go down and go to work right off, and they will have them ready when the dam is completed, practically.

The CHAIRMAN. We figure on completing these two dams in about five years. You can put on paper figures that would indicate that it could be completed quicker, but the history of all these things is that ninety-nine times out of a hundred it takes longer than the figures would indicate. I do not mean by that to cast any reflection on any estimates, either, but that has been the history of all such things from the beginning of civilization, that it takes longer than we think it will.

Mr. WALDO. What little experience I have had with Government matters seems to point to the fact that the Government takes as long as anybody to do those things.

The CHAIRMAN. I am inclined to think it takes longer; but this can be said about the Government, with probably some few exceptions: That when the Government completes a job you could not improve it; it is as near perfect as human ingenuity can make it.

Mr. WALDO. I agree with you, Senator. They do good work when they do it.

The CHAIRMAN. Yes, sir; and if we are working for a hundred years, now—and that is what we are—and, incidentally it ought to be said that nobody knows whether this work will last a hundred years, because there has never been a dam like this constructed that has been in operation for a hundred years—

Mr. WALDO. If you will pardon me, Senator, there are a great many dams of less permanent construction than this that have been in operation for more than a hundred years.

The CHAIRMAN. That is going to be the biggest dam of concrete that man has ever put up in the world, and there is going to be more water go over Dam No. 2 than ever went over any other dam.

Mr. WALDO. It might be expected to have a longer useful life than some smaller structure.

The CHAIRMAN. No; it would be the other way, I think. I am not pessimistic about it. I am not afraid to take the risk, but there is a risk in it, and I do not believe anybody can doubt that. It may be that a hundred years from now invention may have advanced so that this dam will be useless, will not be worth anything.

Mr. WALDO. But, Mr. Ford would have to go right along paying his 4 per cent.

The CHAIRMAN. He will make enough millions out of it in five years after he gets it, so that he can pay that all off in cash.

Mr. WALDO. I am not going to say that I know anything about Mr. Ford's ideas in the matter, but from conversations he has not indicated that he is going into this thing to make the last possible dollar out of it.

The CHAIRMAN. I know, and I do not mean to charge that either, Mr. Waldo. I am not charging him with any motive like that. If you could insure me that he would live a hundred years, I would look at this proposition in an entirely different light than I do.

Mr. WALDO. I do not ask you to go beyond the contract itself, Senator.

The CHAIRMAN. Well, now, speaking of the contract, there has not been much said about it in this examination, but I have been thinking and looking it over on Sunday instead of going to church, and find that this \$55,000 you

have been speaking of that he pays to the Government, as maintenance of these two dams in my judgment will not be one-tenth of what the Government will have to pay to keep those dams in repair. Under Ford's offer the Government guarantees it will keep both of those dams in repair for 100 years, and the only contribution made toward that is \$35,000 annually for Dam No. 2, and \$20,000 for Dam No. 3 by Mr. Ford.

Mr. WALDO. You think it will run \$200,000 to \$300,000 a year?

The CHAIRMAN. Yes.

Mr. WALDO. On what do you base that, Senator?

The CHAIRMAN. I have talked with engineers about it, and just my knowledge of everything human, and the fact that this guaranty is going to run for 100 years, that it is almost the same as perpetual. If you buy land in a city, or if you get a lease for 100 years, you consider you are the owner of the land. Suppose an accident should happen down there and it would take \$100,000 to take care of the dam in a year. The Government has to pay it. The Government not only has to pay it, but the Government has to do it. These people who are opposing Government ownership and operation so strongly and who are in favor of the Ford proposition, forget that the Ford deal itself provides not that Ford will keep the dam in repair, but that the Government shall do it. It must actually do the work and keep it in repair for Mr. Ford, and Ford pays them an insurance, like you would take an insurance policy of \$35,000 on one dam and \$20,000 on the other.

I think experts will say—and they have nothing to base it on, running over a hundred years—but experts I think will tell you that you could not go anywhere in the world and get any company, any corporation, or any individual that would write a guaranty to keep these dams in repair for that amount of money. The Government, even under the Ford offer, will have to keep a set of men there and will actually keep them there all the time. That is what they will undoubtedly do. If they owned it themselves they would have to do it, but they will have to do that whether they lease it to Ford or the Government operates it. There will be no difference, so far as maintenance and work on the dams is concerned.

Mr. WALDO. Don't you think, Senator, that a good way to find out what that should probably amount to would be to consider similar cases that have already been in existence for a period of years?

The CHAIRMAN. I have written letters, now, to get that very information. If I am disappointed I will certainly be glad, and I will submit the evidence no matter whether it carries out what I feel it will or whether it shows that Ford is right. I would be glad to have it show that this is enough money to do it.

Mr. WALDO. And if we can develop certain other evidence in connection with that to show the permanence of such a structure, may we put that in the record?

Partial list of old masonry dams, compiled from Wegman's "Design and Construction of Dams."

DAMS MORE THAN 100 YEARS OLD.

Year completed.	Name.	River.	Location.	Greatest height.	Remarks.
Prior to 1586.....	Almanza.....	Spain.....	68	Rubble masonry faced with cut stone.
1594.....	Alicante.....	Monegre.....	do.....	134	Do.

1868-1870.....	Poona.....	Mitha.....	India.....	127	Uncoursed rubble reinforced with 30-foot earth bank (length, 5,136 feet).
1870 ¹	Tansa.....	Ganges.....do.....	118	Uncoursed rubble (length, 8,800 feet).
1871 ²	Bhatgur.....	Yeluand.....do.....	130	Masonry (length, 4,017 feet).

¹ Date started.

² Final plans approved.

NOTE.—Each of these dams is either in actual service or is in serviceable condition. (According to Wegmann.) Special attention should be called to a dam started shortly after 1873, when the final plans were approved, known as the Betwa Dam on the Betwa River, in India, a 60-foot dam built of rubble masonry laid in hydraulic lime mortar. The dam is 3,296 feet long. Its entire length is used as a spillway, for the river flow varies from 50 to 750,000 cubic feet per second, and this dam has been in actual service for more than 30 years.

DEPARTMENT OF THE INTERIOR,
UNITED STATES RECLAMATION SERVICE,
OFFICE OF THE DIRECTOR,

Washington, July 7, 1922.

Mr. W. G. WALDO,
205 Third Street SE., Washington, D. C.

MY DEAR MR. WALDO: In answer to your oral inquiries I referred to a letter from Director Davis to Maj. J. H. Burns, dated June 14, 1922, and as requested, I am handing you a copy of that letter.

I am also giving you a copy of the latest (twentieth) annual report of the Reclamation Service, from which data can be collected as suggested in the letter to Major Burns.

Hoping these will meet your needs, I am,
Very truly yours,

J. B. BEADLE,
Director's Assistant.

JUNE 14, 1922.

Maj. J. H. BURNS,
3747 Munitions Building, Washington, D. C.

MY DEAR MAJOR BURNS: Answering oral inquiries respecting the depreciation or maintenance cost on masonry dams, our experience has been that such cost is very low, probably so low that insufficient time has elapsed to permit any general conclusions from the structures of the Reclamation Service. Also the conditions affecting the different structures vary so that it is dangerous to draw conclusions as a guide for prediction elsewhere.

However, I am sending you herewith a copy of the latest (twentieth) annual report, in which will be found some information along this line. For example, in the case of the East Park Dam there was charged to maintenance account \$185 for the calendar year 1920 (p. 105). This structure, with related spillway and dikes, cost about \$154,000; the whole storage unit, involving in addition to the dam a feed canal and other items, cost somewhat over \$450,000 (p. 104). The dam is a concrete arch, gravity type, with a maximum height of 139 feet, crest length of 250 feet, and volume of 12,200 cubic yards (p. 538). It was completed in July, 1910 (p. 100). From that time to December 31, 1920, the maintenance account for the dam was charged with a total of \$8,015 (p. 105).

Similar data respecting other dams of the Reclamation Service can be found in the same way throughout the report. In some cases, the data are not given separately for the dam but show only the totals for the reservoir and in a few

cases there may be shown only the total figures for the project-storage system, which may include more than one reservoir.

From these figures and from actual knowledge, I know that the maintenance costs on the dams themselves have been exceedingly low. Probably the bulk of the costs given in the report after the fashion above indicated do not represent any work on main structures but include repairs and replacement of operating mechanisms and such things which are related to the dams and which are much more subject to depreciation.

In a few cases there have been substantial expenditures connected with the dams of the Reclamation Service some time after their construction, and it may be that these are charged to the maintenance account because they are technically classified that way in the eyes of the law governing us, and the charges we must collect from the irrigators who benefit from the works. However, in these cases that I have in mind the substantial repairs or other work were due either to the repairing of damage by flood or to the completion of some work that was deliberately postponed when the dams themselves were first built. In the first category there were some substantial repairs to the spillway at the Roosevelt Dam on the Salt River, Ariz. In recent years a flood came with the reservoir full and put a considerable depth of water over the spillway. This eroded the spillway channels to an extent that made it seem wise to concrete them in anticipation of future floods. This might be called repair, but is more accurately described as betterment, being simply additional work over that originally contemplated and carried out rather than repair or replacement of something that had been built and worn out.

In the other category falls another case of spillway improvement at the Elephant Butte Dam. Here it was always contemplated that substantial work would be required on the spillway additional to what was done when the dam was built, but the work was postponed to spare the expenditure until necessary as well as to permit the selection of a time for it that would be more advantageous and economical. It was clear that the work was not needed at first because the reservoir was designed for large holdover capacity and took a number of years to fill.

From such figures as I have I think the depreciation or maintenance on the body of a well constructed masonry dam will usually be a small fraction of 1 per cent of its cost annually.

Very truly yours,

A. P. DAVIS, Director.

Maintenance cost of concrete or masonry dams, U. S. Reclamation Service.

Project.	Dam.	Type.	Maximum height (feet).	Crest length (feet).	Volume (cubic yards).	Year completed.	Maintenance cost.		
							Total to Dec. 30, 1920.	Approximate average per year.	For calendar year 1920.
Orland, Calif.	East Park...	Concrete	139	250	12,200	1910	\$8,015	\$763	\$145
Yuma, Ariz.	Laguna	Concrete and rock fill weir.	10	4,780	441,732	1909	43,681	3,640	1,390
Boise, Idaho.	Arrowrock ..	Rock fill, concrete core.	349	1,100	585,130	1915	4,766	950	1,567
Minidoka, Idaho.	Minidoka	do.	86	937	242,500	1906	20,737	1,490	\$5
North Platte, Nebr. Wyo.	Pathfinder ..	Broken range masonry arch.	218	432	60,210	1909	12,320	1,070	1,304
Do.	Whalen	Concrete	29	300	80,740	1909	1,179	100
Shoshone, Wash.	Shoshone	Rubble concrete arch.	328	200	78,576	1910	12,115	1,100	101

¹ Includes maintenance on 3 earth-fill dams also used for storage.

NOTE.—The low annual cost for maintaining concrete or masonry dams is indicated from the above records of the Reclamation Service which represent a few cases in which data are available in the twentieth annual report of the director. Unfortunately this specific information is not published for the greater part of the reclamation structures. As pointed out by Mr. Davis in the above letter, the period covered by the data is too short to use as a basis for general conclusions, and special conditions at a given dam may lead to expenditures of a wholly different order than those indicated above. The foregoing exhibits are offered merely to indicate the permanent nature of concrete and masonry structures, their long life and probable low maintenance cost. Maintenance of crest gates would undoubtedly be the chief item in the maintenance of Dam No. 2, Muscle Shoals, outside of the power house.

The CHAIRMAN. Yes, sir. I will be very glad to have it. You will not be able to say when we get through with this hearing, Mr. Waldo, that I have kept out any evidence that I feared would contradict my own statements.

Mr. WALDO. We have no such idea, Senator. A great concrete dam is probably as nearly a truly permanent structure as can be built by man. The maintenance cost is very small. Since cheap power comes down to a proposition of utilizing the secondary power, one might conclude that this could be readily done by selling this secondary power to factories already established in that section having their own steam-power plants. It is true that at a considerable distance from Muscle Shoals there are a good many industrial plants that are operated by steam power, and if you had reliable secondary power you might be able to sell some very cheap power to those companies and let them shut down their steam plants; but no one is going to shut down his plant unless he knows he is going to have the hydroelectric power for a definite length of time. He can not afford to disrupt his organization for the sake of saving a few mills per kilowatt hour for a while. So that as long as your power is of reasonably stable character you could dispose of it, but otherwise you could not even supply it to those companies. They would not have it as a gift. It would be a liability instead of an asset to them.

In this connection the power companies that were invited to bid on Muscle Shoals at the time that Mr. Ford was invited, and who with one accord declared that the secondary power was of no commercial value, made a statement about the secondary power that I would like to put into the record.

The CHAIRMAN. What is it?

Mr. WALDO. It is a combined statement signed by the four principal power companies of the Southeast.

The CHAIRMAN. I would be glad to have you put it in the record. Do they say this secondary power is of no account?

Mr. WALDO. Yes, sir. They say that the secondary 10 months' power has no commercial value.

The CHAIRMAN. Ten month's power?

Mr. WALDO. Yes, Senator; and that we consider to be the very cream of the secondary power.

The CHAIRMAN. Are those people interested in Muscle Shoals? Are they interested in its purchase?

Mr. WALDO. They were merely invited to bid, as Mr. Ford was invited to bid. Here is their statement. It is taken from the hearings of the House committee, and was put into the record by General Beach [reading]:

"The 10 months' secondary power which it is possible to produce at Muscle Shoals has little or no commercial value.

"There are 9 years during the 26-year period covered by the hydrograph of the Tennessee River at Florence, Ala., during which the total availability of primary power on 100 per cent load factor was less than 700,000,000 kilowatt hours per annum. To supply such deficiencies—which will undoubtedly occur periodically in the future as they have in the past—stem backing equal to the full capacity of the Sheffield steam plant, i. e., 60,000 kilowatts, must be exclusively available subject to call to meet such deficiencies; in certain years that capacity would not have been sufficient." (Hearings before House Committee on Military Affairs on Muscle Shoals proposition, Sixty-seventh Congress, second session, page 118.)

The CHAIRMAN. I suppose when they speak of the full capacity of the Sheffield plant they mean the steam plant at nitrate plant No. 2?

Mr. WALDO. Yes, sir. Then they go on to say that [reading]:—

"The hydrograph of the Tennessee River at Florence, Ala., for 26 years (from 1894 to 1919, both inclusive) shows frequent periods of time varying from portions of a month to an entire month, to several entire months, up to a year, when there is no 10-month secondary power. There are only 3 years during the period of 26 years during which such periods or gaps do not occur. There are 7 years in the 26-year period observed during which there is either no 10-month secondary power at all or only a negligible amount. The gaps in the 10 months secondary power, together with the impossibility of predicting when they will occur, inevitably lead to the conclusion that the 10 months' secondary power has no commercial value for public service use capable of measurement."

Our answer to that is that we agree with them absolutely; that if you stand on this thing as it is to-day it is tremendously overestimated by the people

who now claim that Mr. Ford is getting a wonderful bonanza, and we say that he is getting a good thing only if he spends a large amount of money, Senator.

The CHAIRMAN. Yes; but who signed that statement? What are their names? They were contemplating bidding, were they not, like a fellow when he wants to buy a horse; he runs it down just as much as he can. That is what they were doing then.

Mr. WALDO. Let us discount it to the fullest degree on that score—the engineering facts, however, are just as they stated.

The CHAIRMAN. I am not an expert, but when any man tells me that he can operate water power for 10 months in the year and it has not got any value because it will not operate that way every year, I think I have intelligence enough to know that he is trying to hoodoo me.

Mr. WALDO. But their claim is perfectly sound under nonregulated conditions, Senator. They say that it is without value "for public-service use"—that is quite different from electrochemical use.

The CHAIRMAN. Of course, it is not like primary power; but if we have a water power that is good for 10 months you can afford to build a steam plant to run for the other two.

Mr. WALDO. Exactly, if it is 10 months every year, or reasonably close to 10 months every year.

The signatures on that statement are Georgia Railway & Power Co., by H. M. Atkinson, chairman, board of directors; Columbus Power Co., by H. H. Hunt, vice president; Central of Georgia Power Co., by P. G. Gossler, vice president; Tennessee Power Co., by C. M. Clark, president. It is dated May 20, 1921.

The CHAIRMAN. My own personal opinion is that if we pass some bill providing for a governmental corporation to operate this plant the thing to do would be to operate the nitrate plant No. 2 on secondary power and sell the primary power.

Mr. WALDO. As far as possible. Of course, you would have to have some primary power to operate that nitrate plant.

The CHAIRMAN. Oh, yes; you would have to have some primary power, but you could safely sell practically all the primary power that you develop there and then take the secondary power and back it up with the steam. It would cost you a little more money for power, but you would make enough money out of the power that you sold to make a profit out of the whole proposition. Besides, it may be that experience will show that if we operate this plant 10 months in the year it may be enough, even if we hold an organization and give them a vacation of 60 days instead of 30.

Mr. WALDO. You have to consider that you are obliged to supply the full capacity of the nitrate plant in nitrogen fertilizers prepared according to demand; in other words, as a mixed fertilizer, which calls for phosphoric acid. If we consider the normal, present-day status of things it means four times as much phosphoric acid as nitrogen, and if you are going to use the most improved methods, which Mr. Ford here agrees to do, that means electric furnace phosphoric acid and that means the consumption of another hundred thousand horsepower in order to supply sufficient power to make enough phosphoric acid to balance that nitrogen that he is compelled to put in. We will assume that he buys his potash; we will say he gets it from abroad more cheaply than he can produce it; but if he goes into the potash end of the thing there is no telling how much power he will be required to put into fertilizer manufacture.

The CHAIRMAN. He will not go into that until he has surplus power.

Mr. WALDO. And not until it has worked out to a greater extent than it is now.

The CHAIRMAN. You could not expect him to do that, and he would not try. That is just a possibility. If things are favorable, it will come about, and if they are not favorable it never will be realized.

Mr. WALDO. A 2-8-2 fertilizer means 40,000 tons of nitrogen (equal to 250,000 tons of Chilean nitrate, which is the entire amount used in American agriculture in such a normal year as 1913), 160,000 tons of phosphoric acid and 40,000 tons of potash. That is the plant food content of about 2,000,000 tons of 2-8-2 fertilizer, and that is somewhere between 25 per cent and 30 per cent of the total fertilizers consumed in the United States, which, it seems to me, is undertaking a very large-sized contract, Senator. A man who is willing to get under such an obligation as that, I should say, is entitled to certain considerations in the matter of power, getting it, for instance, at an in-

terest rate of 4 per cent, even without considering his obligations regarding the nitrate plant. Suppose a new process comes along. To-day it is the cyanamide process. To-morrow it may be something else.

The CHAIRMAN. We all hope that will happen.

Mr. WALDO. Then what would happen. Under his contract he is obliged to adopt such improved methods.

The CHAIRMAN. Would he not, if he was not bound to do it? If you could make a fertilizer at a reduced cost, and you would be bound to make a certain quantity, would you not utilize that method?

Mr. WALDO. That would not mean anything to him personally if he could make only 8 per cent. The higher the cost the more money he could make.

The CHAIRMAN. Unless there is some improvement he will not make 8 per cent on the operation of the nitrate plant, and he does not expect to.

Mr. WALDO. I agree with you, Senator.

The CHAIRMAN. So if he can devise a new plan, as I think is going to be devised, it seems to me, since there are thousands of scientific men all over the world working on it. Of course he will utilize it. If he considered only his own interest he would utilize it. This corporation, after he is dead, would do that.

Mr. WALDO. Assuming, then, that he does keep up, it is very likely, based on what we are discussing here, that he will have to rebuild that plant not once, but probably several times in the course of its ordinary life.

The CHAIRMAN. It may be.

Mr. WALDO. Suppose the Government had that plant. Would they be likely to do the same thing?

The CHAIRMAN. The bill that I have introduced provides that they shall more than Ford's proposition, because Ford is going to scrap plant No. 1, and all the scientific men who have appeared before us agree that the Haber process in plant No. 1 offers the greatest promise of improvement, and the cheapening of the product. The bill that I have introduced provides that we shall put plant No. 1 in operation and have our experiments going on all the time. Ford is going to use that to make automobiles or something else.

Mr. WALDO. But, Senator, although he has not obligated himself to operate nitrate plant No. 1 as an air nitrogen fixation plant, still he has not agreed not to operate the Haber process, which is an entirely different thing.

The CHAIRMAN. Oh, no. Of course, he can use any process he wants to, and if, by experimentation, either by them or outside parties, some other process is invented (it may be known as the Waldo process) they will want to use it if it is the best, and we want to be in shape so that whoever has it can do that.

Mr. WALDO. But the idea that nitrate plant No. 1 represents an asset in this case is not in accordance with his ideas, as I understand them. It is not that he necessarily thinks that nitrate plant No. 1 represents a process that is wholly impracticable and could not be used at all, but it is simply that the physical conditions existing in No. 1 plant are such that he does not want to be obligated to spend the money necessary to put it in at that particular point. That is all.

Further, after all, Senator, when you consider the sources of nitrogen fertilizers in the United States, those who can produce them at the least cost and whose supply can be sold so as to be consumed first, are the by-product coke ovens. They are in the best position to beat competition. They do not, but they could do it if they wanted to, because their costs are a matter of book-keeping. It is a by-product with them. After that there are the air nitrogen fixation processes that are available, and finally the country resorts to importations. If you can spread the cost of your fertilizers over some other useful product, is not that an effective way to go about reducing the cost of fertilizers?

The CHAIRMAN. Well, that is one way, and a very good way, I should think.

Mr. WALDO. That is one way that he has in mind. The testimony shows efforts to blind him to make nothing but fertilizers here, but if you tie him hand and foot in this regard, then the result is unfavorable because of the fact that he may not be able to do as well for agriculture under those conditions as he might with less restriction.

The CHAIRMAN. He is not bound to follow any process. He can use any process he wants to.

Mr. WALDO. Certainly, but he should not be compelled to make fertilizers exclusively there.

who now claim that Mr. Ford is getting a wonderful bonanza, and we say that he is getting a good thing only if he spends a large amount of money, Senator.

The CHAIRMAN. Yes; but who signed that statement? What are their names? They were contemplating bidding, were they not, like a fellow when he wants to buy a horse; he runs it down just as much as he can. That is what they were doing then.

Mr. WALDO. Let us discount it to the fullest degree on that score—the engineering facts, however, are just as they stated.

The CHAIRMAN. I am not an expert, but when any man tells me that he can operate water power for 10 months in the year and it has not got any value because it will not operate that way every year, I think I have intelligence enough to know that he is trying to hoodoo me.

Mr. WALDO. But their claim is perfectly sound under nonregulated conditions, Senator. They say that it is without value “for public-service use”—that is quite different from electrochemical use.

The CHAIRMAN. Of course, it is not like primary power; but if we have a water power that is good for 10 months you can afford to build a steam plant to run for the other two.

Mr. WALDO. Exactly, if it is 10 months every year, or reasonably close to 10 months every year.

The signatures on that statement are Georgia Railway & Power Co., by H. M. Atkinson, chairman, board of directors; Columbus Power Co., by H. H. Of course, he can use any process he wants to, and if, by experimentation, either by them or outside parties, some other process is invented (it may be known as the Waldo process) they will want to use it if it is the best, and we want to be in shape so that whoever has it can do that.

Mr. WALDO. But the idea that nitrate plant No. 1 represents an asset in this case is not in accordance with his ideas, as I understand them. It is not that he necessarily thinks that nitrate plant No. 1 represents a process that is wholly impracticable and could not be used at all, but it is simply that the physical conditions existing in No. 1 plant are such that he does not want to be obligated to spend the money necessary to put it in at that particular point. That is all.

Further, after all, Senator, when you consider the sources of nitrogen fertilizers in the United States, those who can produce them at the least cost and whose supply can be sold so as to be consumed first, are the by-product coke ovens. They are in the best position to beat competition. They do not, but they could do it if they wanted to, because their costs are a matter of book-keeping. It is a by-product with them. After that there are the air nitrogen fixation processes that are available, and finally the country resorts to importations. If you can spread the cost of your fertilizers over some other useful product, is not that an effective way to go about reducing the cost of fertilizers?

The CHAIRMAN. Well, that is one way, and a very good way, I should think.

Mr. WALDO. That is one way that he has in mind. The testimony shows efforts to bind him to make nothing but fertilizers here, but if you tie him hand and foot in this regard, then the result is unfavorable because of the fact that he may not be able to do as well for agriculture under those conditions as he might with less restriction.

The CHAIRMAN. He is not bound to follow any process. He can use any process he wants to.

Mr. WALDO. Certainly, but he should not be compelled to make fertilizers exclusively there.

The CHAIRMAN. Yes. The Government does not issue them.

Mr. WALDO. The Government bureaus do, and each bureau does it in its own way.

The CHAIRMAN. What has that got to do with the Government Printing Office?

Mr. WALDO. That is just simply another example of the Government undertaking to meet a need that is ordinarily met by private individuals, private initiative. One part of good service, the production part, is wonderfully well done; the other requirements for putting the product into the hands of the consumer are woefully lacking.

The CHAIRMAN. Why do not private individuals print these maps that you say are difficult to get?

Mr. WALDO. Because they are part of the recorded data in large Government undertakings. Private interests in general do not undertake to compete with the Government in these maps.

The CHAIRMAN. Nobody takes them from the Government. That is no competition. People do not like to read them when the Government makes them.

Mr. WALDO. The things that they deal with frequently are not those things for which there is a large and universal demand, although that is not always true, by any means.

The CHAIRMAN. What would you have to pay for this document [indicating] if you went to the Government Printing Office and bought it?

Mr. WALDO. Fifty cents, and it is undoubtedly worth \$5 to many people.

Major BURNS. The Government sends a copy of that document to everybody that it knows of that is interested in the subject.

The CHAIRMAN. Of course, it is something that the great mass of the people take no interest in. It is a scientific proposition. I have been amazed lots of times when I hear scientific men talking about a subject in regard to their knowledge about these Government propositions. In your own testimony to-day you have illustrated it. You know all about those reports. I don't know them. I haven't read most of those reports that you have referred to on the Tennessee River. But do you suppose you could take those reports to the State of Nebraska, for instance, and sell them for 5 cents apiece? There would be a few people, I suppose, interested in the subject who would buy them, but the ordinary person would not buy them.

Mr. WALDO. But many of these books are most excellent textbooks on their subjects; others are splendid for general reading.

The CHAIRMAN. Yes; they are.

Mr. WALDO. Yet frequently they do not get anywhere, Senator.

The CHAIRMAN. I agree with you.

Mr. WALDO. There are certain principles that we are trying to have incorporated into water-power development in connection with this particular Tennessee Valley development, and one of those is that the man who is willing to underwrite the future production of fertilizers to the extent of 25 per cent to 30 per cent of the fertilizers used in this country is entitled to receive a lower rate for power, and that means 4 per cent money. We claim that practically all power in the streams of the United States is paying an unwarrantable tax because of high interest rates. There is no other industry in which interest enters into the cost to such a great extent as in the development of hydro-electric power. It does not cost you a great deal of money to operate a hydro-electric plant, but it does cost a very large sum to build it.

So if you have to pay 7 per cent or 8 per cent for your money, your interest charges constitute most of your power cost. If your power costs you \$200 per installed horsepower, your interest at 8 per cent, and your fixed charges will total as much as 85 per cent of the cost of the power. In what other industry do the fixed charges amount to such a large percentage of the total

said board shall determine the equitable territorial distribution of the same and may in its discretion make reasonable regulation for the sale of all or a portion of such products by the company to farmers, their agencies, or organizations. If and when said board can not agree upon its findings and determinations, then the points of disagreement shall be referred to the Federal Trade Commission (or its legal successor) for arbitration and settlement, and the decision of said commission in such cases shall be final and binding upon the board.

The CHAIRMAN. And the Farm Bureau and the Grange and some other farm organizations are going to nominate representatives or suggest them to the President.

Mr. WALDO. Yes, sir.

The CHAIRMAN. To my mind, I would have thought a great deal more of Mr. Ford's offer if he had omitted that. I think it can not be considered to be anything else than a bid to those fellows in Washington who represent these farm organizations to get their organizations behind Ford's offer, and that is just what has happened. And when you think this is to last a hundred years, the idea of the Farm Bureau existing for a hundred years, or even the National Grange! The probabilities are that they will be out of existence in 10 years. They may live for a hundred. That would be the object of this great corporation owned by Wall Street in a few years after Mr. Ford died. They would have possession of these farm organizations overnight. To my mind it is worse than nothing to put that in there, because we can not conceive of what these organizations are going to be in 50 years from now or a hundred years from now.

Mr. WALDO. I will agree that perhaps not one of the three organizations, whose representatives constitute the majority of the board, will live 100 years. But they will have successors. That means that Mr. Ford's company deals, not with this or that particular farm organization, but with organized agriculture, the permanence of which there can be little doubt, for whatever else fails in this country agriculture must not fall, whatever happens. Furthermore, if there is no regulation whatever, then how are you to be assured that the profit is limited to 8 per cent?

The CHAIRMAN. I think that is a very proper thing to consider, but it seems to me that to do a thing of that sort would not mean certainty, but it would be as near as we could come to it. If we wanted to provide for that, it ought to be under the jurisdiction of some governmental authority that we know is going to stay as long as the Government exists, unless we change our form of government.

Mr. WALDO. I am willing to leave it to the farmers, Senator. Without taking the time to read this, I wish to put into the record what General Beach has to say with regard to these reservoirs and what might be accomplished by them.

General BEACH. Every dam that is built on the upper Tennessee which will restrain the flood waters and let them out gradually during the low-water season will increase the primary power at Dam No. 2, with a corresponding decrease in the secondary power. Mr. Ford has said that if he obtained the lease of this property at Dam No. 2, or the lease of the property according to his proposition, he intends to come in and make application for other dams on the upper river and develop them up there above with the idea of utilizing the power which he can obtain from them and increasing the value of the power which he has made arrangements to obtain by his offer at Dam No. 2. That one feature of the case alone appears to me to be worthy of the most careful consideration by Congress, for I believe that the leasing of Dam No. 2 to Mr. Ford will be followed by a development along the Tennessee River which would be very material, and would probably amount in a few years to more than you would get in any other way in the course of a generation or two."¹

The CHAIRMAN. All right.

Mr. WALDO. Then I want to follow that with what Major Fiske, the district engineer, hopes to accomplish by means of these same reservoirs. We all know what is expected to be accomplished.

"Existing information indicates that by building the two dams on the Clinch River, which give the maximum storage of any possible in this basin, the primary power at Muscle Shoals might be doubled, and that by building still other dams on various tributaries the primary power at Muscle Shoals might be brought up to nearly three times what seems possible under present condi-

terms of the contract?

I agree there is not, and if you find a bidder who will agree as Mr. Ford has, I will agree with you.
 My own opinion is that the stock will be worth a thousand million Ford gets it.
 I see the basis for that, Senator. If that is so there should have been bidders offering to do what Mr. Ford has offered.
 That is the greatest real estate snap that has ever taken place since the war. They are selling lots down there on the strength of it, and Mr. Ford is in business too, if he wants to.
 Those things are incidental in connection with this thing. They have the price of property down there to such a point that they are discounting it a little bit late if he is going to make anything out of that.
 AN. But he is getting a deed to nearly 5,000 acres of land from the

State. All right, but he can not sell that except under the terms of the contract. I would not want any of it under such terms, I am sure, and I do not think a purchaser would want to get any of it and have a cloud on his title of that

here is the matter of amortization, Senator. If you have a 100-year period set up an amortization that does not affect the cost of the power appreciably for the first generation and in the future generations. It has the advantage of bringing the cheap powers of Norway and Canada into the United States, because it removes the greatest part of the cost. That is self-evident.

THE CHAIRMAN. Of course amortization, when you spread it out over a 100 years, it becomes nothing. You pay it and don't know it.

MR. WALDO. You don't know it, that is right. But when you cut that down to 20 years, you would know it.

THE CHAIRMAN. You would feel it a little more.

MR. WALDO. You multiply it by eight.

THE CHAIRMAN. On the other hand, if you should run it out over 1,000 years you would not be able to see it with a magnifying glass.

MR. WALDO. I agree with you. But as a broad policy, if this country would adopt a policy of requiring amortization to be spread over a long term of years, and have those sinking funds set up, there would come a time when there would be cheap power in this country. As it is now the amortization clauses do not run long enough to relieve the power companies of a heavy burden that they are required to carry because there is so short a time, and then when it comes to refinancing, it is not a case of relieving the power company of some of its burden, but it generally means saddling it up with more. They pay commissions—and I do not have any objection to that; I do not say that the man who furnishes the money should not receive a fair return on his investment, nor the man who finances it should not receive a fair return. But if there is a way by means of which this capital can be amortized and returned and the cost of power reduced, it seems to us that any reasonable method of that sort would be a national asset, if it can be made a public policy. Here is one case where the attempt is being made to do that very thing, so that future generations will have power at the mere cost of operating the plant, which means cheaper power than Norway or Canada.

Canada, for instance, is developing power at a very much more rapid rate than the United States; the power developed in Canada per thousand population was 47 horsepower in 1902, 198 horsepower in 1912, and 315 horsepower in 1920, and the horsepower developed in the United States under its policy was 26 horsepower in 1902, 51 in 1912, and 93 in 1920.

THE CHAIRMAN. What was the 1920 figure in Canada?

MR. WALDO. Three hundred and fifteen horsepower.

THE CHAIRMAN. Does that take in the whole Dominion of Canada?

MR. WALDO. Yes, sir.

THE CHAIRMAN. That is a wonderful showing for Canada. Is it not true that over in Canada the great bulk of this is developed by the Government itself?

MR. WALDO. They are undertaking to develop it in Ontario. The Ontario Hydro-electric Power Co. is undertaking, by means of Government control, to make the development.

THE CHAIRMAN. Government ownership?

MR. WALDO. Government ownership; yes, sir.

THE CHAIRMAN. And operation?

MR. WALDO. They are undertaking a plan of that sort. They are having great difficulties with it in spite of their natural advantages.

amount of his primary power at Muscle Shoals; and, of course, the building of Muscle Shoals Dam No. 3 gives him just 38 feet more head over which to use the water which he conserves with those storage dams.

The CHAIRMAN. I have always felt, Mr. Waldo, that no private individual would bind himself to build these storage dams unless he intended to utilize and build enough dams on the river between the storage dams and Muscle Shoals so that he could get the benefit of his expenditure, and Mr. Ford has not agreed to do that. I do not believe he will do it, because it seems to me there is only one power in the world that can afford to do that, and that is the Government. It is true that if he should build a storage dam and somebody down below would build a dam for power purposes, under the water power act they would have to contribute their proportion.

Mr. WALDO. There is one dam already there, Senator, at Hales Bar.

The CHAIRMAN. Oh, yes; there is one; but there are places for a whole lot more. There is more power to be developed along the river.

Mr. WALDO. Oh, yes; certainly.

The CHAIRMAN. Private individuals can not be expected to go up and build reservoir dams, because they have to wait to get any return out of it for other people to develop power between them and Muscle Shoals. The Government could afford to do that, then everybody who built under the law any dam between would have to contribute to the Government part of the expense.

Mr. WALDO. I think Mr. Ford would be very glad if the Government would build those storage dams, Senator.

The CHAIRMAN. My idea of it is that the Government ought to do it, because you can not expect a private person to do it, because he may have to wait 25 years before somebody else develops more power, and men will not invest their money to do that. The Government can afford to do it, and as soon as the Government does do it it will be the greatest inducement for other people to come in and build power dams and take them under the water power act, because they will get a great deal better and cheaper power that way than they would if these dams are not constructed.

Mr. WALDO. However, Senator, Mr. Ford is interested, assuming that he has Muscle Shoals. The fact that he can get 140,000 additional primary horsepower by building these dams would make him rather impatient if the Government should lose time in going ahead with the proposition.

The CHAIRMAN. The Government is not going to do it if it accepts Ford's offer, of course, because it has no direct interest in it then. The Government, of course, will not build those dams then.

Another reason why it ought to be done is that it is fair to assume that this flowage right will cost more in the future than it will now. The country will settle up and land will become more valuable, and therefore the expense will be increased and may be increased to such an extent that it is not a practical thing to go ahead with. The Government itself could go ahead and do it all at once, even if it had to wait a while for a return on some of its money, and thereby bring about great development of the entire stream, and it would be a good thing to do, but I don't know how any private individual could be expected to do it. Nobody has offered to do it. Mr. Ford would not think of binding himself in his contract to do it. We could not expect him to. I myself would not expect him to do it, and I don't believe he ever would do it.

Mr. WALDO. Senator, he has the best kind of business reasons for doing it, and his chief engineer, Mr. Mayo, has testified that he is prepared to spend \$50,000,000, if necessary, to carry out his end of this plan, and it requires only a fraction of \$50,000,000 to build those dams.

The CHAIRMAN. I took his statement to mean that Mr. Ford would spend \$50,000,000, including factories at Muscle Shoals, where that city is going to be built.

Mr. WALDO. Well, he had in mind these dams up here, Senator.

The CHAIRMAN. I don't think he had.

Mr. WALDO. Mr. Mayo has told me that he did have.

The CHAIRMAN. He did?

Mr. WALDO. Yes, sir.

The CHAIRMAN. Well, that is another thing. Can Mr. Ford speak for the corporation after he is dead—that it will do it?

Mr. WALDO. Well, sir, I expect that there are some elements of risk in the Ford offer, and one of them is that Mr. Ford may die right away; but if Mr. Ford lives, we will say, another 10 years, if you please—

The CHAIRMAN. I think that is a fair assumption to say that he would live 10 years.

Mr. WALDO. All right, sir. Then under those conditions I think it would be a fair expectation that these improvements will be put in.

The CHAIRMAN. Well, Mr. Waldo, in 10 years; if this proposition were accepted to-day, it would be 10 years before the thing would be in full swing.

Mr. WALDO. I agree with you, as to the whole storage project.

The CHAIRMAN. If we accept Mr. Ford's offer to-day, it will be 10 years before the factories begin to operate in good shape and are well organized.

Mr. WALDO. Well, sir, I have seen something of the way they do things there at the Ford plant, and 10 years is a long time in the history of the Ford organization.

The CHAIRMAN. Yes; I admit that. I have great respect for him. I think he has built up a wonderful organization.

Senator HEFLIN. His friends say if he gets this proposition he will go down and go to work right off, and they will have them ready when the dam is completed, practically.

The CHAIRMAN. We figure on completing these two dams in about five years. You can put on paper figures that would indicate that it could be completed quicker, but the history of all these things is that ninety-nine times out of a hundred it takes longer than the figures would indicate. I do not mean by that to cast any reflection on any estimates, either, but that has been the history of all such things from the beginning of civilization, that it takes longer than we think it will.

Mr. WALDO. What little experience I have had with Government matters seems to point to the fact that the Government takes as long as anybody to do those things.

The CHAIRMAN. I am inclined to think it takes longer; but this can be said about the Government, with probably some few exceptions: That when the Government completes a job you could not improve it; it is as near perfect as human ingenuity can make it.

Mr. WALDO. I agree with you, Senator. They do good work when they do it.

The CHAIRMAN. Yes, sir; and if we are working for a hundred years, now—and that is what we are—and, incidentally it ought to be said that nobody knows whether this work will last a hundred years, because there has never been a dam like this constructed that has been in operation for a hundred years—

Mr. WALDO. If you will pardon me, Senator, there are a great many dams of less permanent construction than this that have been in operation for more than a hundred years.

The CHAIRMAN. That is going to be the biggest dam of concrete that man has ever put up in the world, and there is going to be more water go over Dam No. 2 than ever went over any other dam.

Mr. WALDO. It might be expected to have a longer useful life than some smaller structure.

The CHAIRMAN. No; it would be the other way, I think. I am not pessimistic about it. I am not afraid to take the risk, but there is a risk in it, and I do not believe anybody can doubt that. It may be that a hundred years from now invention may have advanced so that this dam will be useless, will not be worth anything.

Mr. WALDO. But, Mr. Ford would have to go right along paying his 4 per cent.

The CHAIRMAN. He will make enough millions out of it in five years after he gets it, so that he can pay that all off in cash.

Mr. WALDO. I am not going to say that I know anything about Mr. Ford's ideas in the matter, but from conversations he has not indicated that he is going into this thing to make the last possible dollar out of it.

The CHAIRMAN. I know, and I do not mean to charge that either, Mr. Waldo. I am not charging him with any motive like that. If you could insure me that he would live a hundred years, I would look at this proposition in an entirely different light than I do.

Mr. WALDO. I do not ask you to go beyond the contract itself, Senator.

The CHAIRMAN. Well, now, speaking of the contract, there has not been much said about it in this examination, but I have been thinking and looking it over on Sunday instead of going to church, and find that this \$55,000 you

The CHAIRMAN. All right, Mr. Waldo.

Have you got the statistics there as to the amount of fertilizer used by each State?

Mr. WALDO. By States, yes, sir.

The CHAIRMAN. Put that in the record.

Mr. WALDO. I have it to go into the record. This will show the total fertilizer consumption for previous years. That is valuable for comparison.

¹ Estimated.

In looking over this situation, Senator, we find a striking thing, that these nine States—Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, and Pennsylvania—where the opposition to any kind of fertilizer plant at Muscle Shoals seems to be centered—

Senator HEFLIN (interposing). How do you account for that?

The CHAIRMAN. He is just about to tell us, I suppose.

Mr. WALDO. I want first to get the situation here.

In 1909 those States spent \$20,957,397 for fertilizer. In 1919 they had increased that 111.2 per cent, and were spending \$44,276,981 for fertilizer. And what was

happening? During that same period their population was increasing from 14,507,407 to 29,662,053, an increase of 103 per cent or an annual increase of about 378,866 people. But the improved lands in farms in 1880 was 46,385,632 acres. In 1920 it was 32,676,708. Agriculture has been abandoned on 13,708,924 acres, a decrease of nearly 30 per cent, and an annual decrease of about 342,723 acres. The total number of farms decreased from 692,999 to 577,797, or a decrease of 115,202, an annual decrease of 2,880 farms. In other words, on an average 2,880 farms went out of business every single year for the last 40 years in this particular territory. What has the Government been doing in the way of increasing the farm acreage through its Reclamation Service? Between 1913 and 1921 the total increase was 532,858 acres, or 66,607 acres a year. In other words, for every acre that we have brought under cultivation by our efforts as a Government through the Reclamation Service, 5.2 acres have been abandoned by the farmer in the East who found that he could make more money by doing something else than farming. Why could he make more money by doing something else? Because the returns per acre that he had in cultivation were so small that he could go to the towns and make more money per day, or he could go farther West, and it is well known, of course, that the Central West was settled by people from New England. If we continue at this rate—and I will put the data into the record—how long will it be before we will have little or no agriculture in these Eastern States?

Data from United States census.

The CHAIRMAN. That is exceedingly interesting, but haven't you left out one thing? It seems to me the only increase you have shown has been the increase from reclamation. There have been other increases besides that.

Mr. WALDO. That is true, but we have now come to the limit of those increases, as everyone agrees. During the period from 1880 on, of course, there were large acreages taken up in the West, but during the last 10 years the western territory has been pretty fully taken up, and what we can expect to get is what little can be had through reclamation by irrigation or drainage.

The CHAIRMAN. Do you think that accounts for the opposition you say comes from that group of States you have named?

Mr. WALDO. No, sir; I don't say it accounts for it, but I say that their opposition is strangely short sighted when agriculture is being abandoned at such a rate that the State of New York issues a book about the size of this one, or a little bit thicker, listing and describing not less than 1,200 farms that are offered for sale. A man who has a farm for sale can have it advertised free of charge in that book, which is sent out broadcast over the country, trying to induce people to come there and farm those worn out lands. We say if we can reduce the cost of fertilizer the cultivation of those lands can be made profitable. Whenever those lands can be cultivated profitably, they will be farmed and the taxable value will greatly increase.

The CHAIRMAN. Now, I agree with all of that, Mr. Waldo, but I have not found—I have not looked it up, and may be you are entirely right—that the opposition to any kind of development there is confined to those States. That may be true. I just happen to think now of one member of the committee of the House that came back when they defeated this proposition in the House a couple of years ago was from the State of Nebraska.

Mr. WALDO. I do not say, Senator, that all of the opposition to the development of Muscle Shoals is confined in those States, but a very large part of it comes from there.

The CHAIRMAN. I was on the committee when that was heard before. I know from private conversation with members of the committee and other Members of the Senate, but particularly members of the committee, there was a good deal of doubt as to how they would vote in this meeting on Muscle Shoals, and there was not any of them that was opposed to anything that would bring about improvement of the fertilizer situation; but they formed the idea that this was a great big graft down there in Alabama; that the Government might just as well quit it. And coupled with that thought, a great many of them held—I did not agree with them—that the Government never ought to do anything, and therefore they had better charge it off as a war loss and just let that whole project be scrapped.

When you speak about propaganda against the proposition, I have been here a good many years, and of all the things I have ever taken hold of or had anything to do with I have never yet found anything that exceeded the propaganda trying to influence Congress in favor of the Ford proposition. I want to tell you that I get it from all over the United States, particularly from my own State, all kinds of propaganda denouncing me because I won't favor Ford's proposition.

Mr. WALDO. Senator, do you consider honest expression of opinion as propaganda?

The CHAIRMAN. What is that?

Mr. WALDO. I say do you consider honest expression of opinion as propaganda?

The CHAIRMAN. No. Not by any means. And I am not opposed to propaganda. We have got to meet that, and anybody that can not meet it ought to go home. But there are people right now running for Congress on the Ford proposition. I am not blaming Mr. Ford, Mr. Waldo, nor you. As far as I know, any of you people that have been here have all been on a much higher basis than that. You have been perfectly square and honorable, so far as I know. But there is one of the greatest propagandas that has ever been put forth, that I have ever had anything to do with.

Senator HEFLIN. And the fertilizer fellows are sending out their propaganda.

The CHAIRMAN. It may be, and it has been charged all along that there is a fertilizer trust, and I believe it, because I knew nothing about it, and because I heard Senator Hefflin repeat it so many times.

Senator HEFLIN. Yes. There is no doubt about it.

The CHAIRMAN. There have been men on the witness stand, and I had here and examined the fellow that is the head of the fertilizer organization, the man who has been most active in this fertilizer business who, if there is a fertilizer trust, was the head of the trust. So far as the testimony before this committee is concerned, if it was submitted to a jury, no jury could find that there is such a thing as a fertilizer trust. I have announced to Senator Hefflin that I will get anybody in the United States that he wants to get here to testify about the Fertilizer Trust.

Senator HEFLIN. I don't have to have any proof. Every farmer in the country that buys fertilizer knows they have got one.

The CHAIRMAN. That may be true, but it has not been proven here, and I don't think anybody will charge me with being a friend of the fertilizer trust.

Senator HEFLIN. Silver and Bower both testified there was a trust.

The CHAIRMAN. What is that?

Senator HEFLIN. Silver and Bower both testified there was a trust. I asked them if this would not relieve them from the fertilizer trust, and they said it would.

The CHAIRMAN. Oh, yes; but that does not prove that there is a trust. I defy any man to point to any evidence that we have here from which one could properly draw the conclusion that there is a fertilizer trust.

Mr. WALDO. And you believe that there is not a combination of interests that are determined to put this thing down by hook or crook if they can do so?

The CHAIRMAN. That has not been developed here.

Senator HEFLIN. I don't feel that way about it.

Mr. WALDO. Have you ever seen the colored circular sent to Congress from the National Fertilizer Association?

The CHAIRMAN. No. They have never sent it to me.

Mr. WALDO. You have never seen the booklet published by the by-product coke oven people?

The CHAIRMAN. I have a stack of stuff down in my office. I have a lot of stuff that would fill this table.

Mr. WALDO. Who has it come from?

The CHAIRMAN. They come from a lot of people who tell me, "If you don't get behind the Ford offer we will defeat you when you run for reelection." You can not go down in Alabama to-day and run for office and be elected unless you are for Ford.

Mr. WALDO. Because of what those people think the Ford proposition will do for the United States.

The CHAIRMAN. I think so. Not particularly for the United States, but a good many of these people are looking after their own interests. Why, we have an office right here in Washington for the purpose of selling lots. I have over in my desk an advertisement right now of lots at Muscle Shoals.

Mr. WALDO. Well, we don't know anything about that.

The CHAIRMAN. I don't charge it to you. I have not said so.

Mr. WALDO. That is not legislative propaganda, Senator.

The CHAIRMAN. Yes; that is propaganda. Those people expect to make millions, and are offering land for sale now, and want to get the first payment on a lot. I suppose they are working for Ford. Every one of them is doing everything he can, advertising in the papers. I saw an advertisement in a Washington paper just the other day that said: "Come down to the office and buy your lot and make your first payment. There is going to be a big city there."

Mr. WALDO. There may be a few real estate people who are trying to put over something of that sort.

The CHAIRMAN. I would not mention that, Mr. Waldo, except when you commence to talk about the great propaganda that is opposed to Ford. There are lots of people that are opposed to Ford and opposed to what I have introduced, and opposed to every other bidder, because they are opposed to the Government doing anything down there. There are lots of such people, and I have assumed that they are honest in their convictions. I have not tried to go behind what is right out on the face. They are just as bitterly opposed to the bill that I have introduced as they are to Ford's proposition.

Mr. WALDO. The point I want to make, Senator, is that the opposition that comes to this development of Muscle Shoals is not the opposition of the man on the street, it is the opposition of the fellow who does not want to see anything done, because he does not want Mr. Ford to interfere with what he is doing.

The CHAIRMAN. I have no doubt but what that is true. On the other hand, there is the fellow in favor of Ford who has nothing in it in the world but dollars. He expects to get rich.

Mr. WALDO. Well, he is very much in the minority, unless you include the farmers of the country, who really expect to get a benefit.

The CHAIRMAN. No; I don't mean the farmer. I am not including the farmer.

Mr. WALDO. Then I think they are very much in the minority, Senator.

The CHAIRMAN. They are able to pay for advertisements in the newspapers of the country.

Mr. WALDO. The basis on which I make my statement, Senator, is a different one entirely. We secure clippings through these clipping bureaus, to obtain the true feeling throughout the country on the Ford proposal, as judged by the editorials that appear in the different papers, and we find an almost universal sentiment for this except in a very definite location.

The CHAIRMAN. Of course, I can not contradict that.

Mr. WALDO. I do not offer any explanation for that, but I say it is short-sighted for those people to take that view, because they are the ones who need, as much as any other section of the country, the results that can be obtained from such a thing as this.

The CHAIRMAN. Yes. I think they need them more.

Mr. WALDO. There are many other water powers in the United States, notably out in the West, in Senator Kendrick's State, for instance, Wyoming, where they have untold millions of tons of phosphate rock and water power close by, and a supply of alunite—aluminum, sulphuric acid, and potash—and of course the nitrogen of the air is as available there as anywhere, so that what we really look for is that this thing will simply be an operation preliminary to a very much larger development out in the far West, and for the reason that it will be possible to produce those very highly concentrated plant foods that no one is producing at this time for the American market. I mean ammonium phosphate, for example, which is the kind of fertilizer that would be produced at Muscle Shoals, containing about 15 per cent of ammonia and about 62 per cent of phosphoric acid. There is a total of approximately 77 per cent of plant food as against the 12 to 14 per cent material which is in use to-day.

It is because of those possibilities that there is such widespread interest in this case. Of course if these farm organizations did not inform the people about it and did not bring the facts to their attention, then Congress can not know what they are thinking about it.

Senator, after our studies of this thing we have concluded that the net gain to the Government under the Ford offer is \$75,000,000 in the lease period. This takes into account the fact that he does not pay interest during the construction period up to the time when the first 100,000 horsepower is installed and ready for service at Dam No. 2, and 80,000 horsepower is installed and ready for service at Dam No. 3. It takes into account the interest after construction that he pays, and the interest that the Government must pay under the circumstances. It includes the depreciation which Mr. Ford carries on the nitrate plant at the rate of depreciation figured by the Ordnance Department, which is not, as they say themselves, the rate of depreciation that would be figured by a commercial organization. It includes the savings in guarding the nitrate plant, and takes into account the possible lease value of the steam plant at nitrate plant No. 2 for a hundred years, and includes what was testified as the probable value of the lease of the Gorgas steam plant, for a hundred years, and then figuring the value of the elimination of the Muscle Shoals Canal at the present rate of expense, \$53,000 per year—last year it was \$67,000. It includes Mr. Ford's retirement fund and gives him credit for the Government's cost of maintaining a fixed nitrogen research laboratory now being carried on at \$250,000 a year. We do not figure any compound interest except on that item which constitutes the sinking fund that this plan proposes to set up. I have very little patience with those people who figure compound interest on Government expenditures, because it is a well known fact that no Government expenditures can carry compound interest and none ever have. One does not lose that which one never had and never had a chance to have. No one ever offered to return compound interest on any Government expenditure that I know of. Figuring compound interest on a sinking fund that will actually be set up and administered so as to earn compound interest is quite another matter.

The CHAIRMAN. Of course I have not seen those figures that you have given, but let us take one of them. Do you want to put them in the record?

Mr. WALDO. Yes, sir.

The Muscle Shoals account under the Ford offer.

Items.	Debit.	Credit.	Remarks.
Government interest during construction:			
On Dam No. 2, 4 per cent on \$25,000,000 for one-half of 3 years.	\$1,500,000	United States Engineers estimate of cost to complete these dams is \$50,000,000 (H. R. Doc. 167, 67th Cong., 2d ses., p. 21. United States Engineers estimate of time required, same reference as above (p. 22).
On Dam No. 3, 4 per cent on \$25,000,000 for one-half of 3 years.	1,500,000	

The Muscle Shoals account under the Ford offer—Continued.

Items.	Debit.	Credit.	Remarks.
Interest after construction, 4 per cent on \$50,000,000 for 97 years.	\$194,000,000		Mr. Ford pays 4 per cent on the cost of the dams, whatever that cost may be, after a preliminary period during which payments are as shown. These figures assume that the first 80,000 horsepower will be ready at Dam No. 3 in 2 years after the first 100,000 horsepower is ready at Dam No. 2.
Ford interest payments:— Account Dam No. 2— 6 payments of \$200,000...\$1,200,000 94 payments of \$1,000,000...94,000,000		\$95,200,000	
Account Dam No. 3— 3 payments of \$160,000.....480,000 95 payments of \$1,000,000...95,000,000		95,480,000	
		40,000,000	
Depreciation on nitrate plant No. 2 during lease period, 100 years, at \$400,000.		10,000,000	Nitrate plant to be maintained under Ford offer for 100 years without expense to Government. This plant would actually have to be rebuilt at least four times. Letter of General Williams to Congressman James, June 6, 1922.
Guarding nitrate plant No. 2, 100 years, at \$100,000.			
Possible value of lease of steam plant at nitrate plant No. 2, to Alabama Power Co.	20,000,000		Letter of General Williams, above.
Probable value of lease of Gorgas steam plant to Alabama Power Co., 100 years, at \$75,000.	7,500,000		Letter of Secretary Weeks to Speaker of House, Feb. 1, 1922.
Value of termination of Muscle Shoals Canal, 100 years' expense at annual average of \$53,000.		5,300,000	Mr. Ford pays \$55,000 annually for maintaining locks in new dams.
Ford retirement fund in 100 years....		49,000,000	Approximate total of an annuity provided by Mr. Ford invested at 4 per cent.
Relieves Government of cost of operating its fixed nitrogen research laboratory established under the national defense act of 1916 and now being operated at an average annual cost of \$250,000, 100 years, at \$250,000.		25,000,000	Mr. Ford agrees to maintain a laboratory for the same purposes as those of the fixed nitrogen research laboratory.
Total.....	224,500,000	319,980,000	
Net gain to Government under Ford offer during lease period.		95,480,000	

The CHAIRMAN. You have an item there of \$250,000 a year for a hundred years for investigation purposes.

Mr. WALDO. I wish we had done that for the past hundred years.

The CHAIRMAN. So do I. But tell me what part of Mr. Ford's bid provides for the expenditure of \$250,000 a year by this corporation in investigation.

Mr. WALDO. Not that amount of money, but the undertaking that he agrees to is such as can reasonably be expected to amount to that. It will eliminate the necessity for a \$250,000 operation on the part of the Government.

The CHAIRMAN. The point I am wondering about is why will this corporation build that. It is under no obligation to spend \$250,000 a year. Suppose they say that is too much, and they will spend a thousand dollars a year instead. Have they violated their contract?

Mr. WALDO. Yes, sir.

The CHAIRMAN. How? What part of it?

Mr. WALDO. Because the spirit of this contract is that this thing shall be of such magnitude as to produce a useful result, and if Mr. Ford violates the spirit of this thing when it is established in such a well-known way in the minds of a hundred million people, he might just as well violate the terms out and out.

The CHAIRMAN. But when you get into court you won't rely on the hundred million people at all. The judge will look at the contract and say, "What does the bond say? That does not provide for an expenditure of \$250,000 a year in this proposition, and they have not violated the contract if they spend only \$250." Where is the part of the contract that they have violated? Tell me that.

Mr. WALDO. The idea in this proposal is that you are undertaking to put into operation a sufficient amount of research work to accomplish useful results.

The CHAIRMAN. Who says that? Who passes on that?

Mr. WALDO. Any court would pass on that.

The CHAIRMAN. No; but this corporation that Mr. Ford sets up is the one that is going to pass on that.

Mr. WALDO. But there are going to be people who will benefit by such an operation.

The CHAIRMAN. Suppose the Government would come along and say, "You have only spent a thousand dollars here," and they would say, "With that thousand dollars we have made all the investigation possible"; and they are the ones to decide it, and whether this corporation does it or not, the Government, of course, will go on, I hope, with its investigation just the same.

Mr. WALDO. Certainly, Senator, but you are in a commercial operation. Suppose I am in business. I will say that I will not deliberately break my contract that I have made with my customers. I have built up a tremendous business here, we will say, and have customers all over the country, and then instead of actually breaking my contract with them, by some more or less evasive means I manage to beat the spirit of the thing that I entered into, how long would my company last?

The CHAIRMAN. It would not hurt your company a bit. You have not violated the agreement.

Mr. WALDO. I have lost my customers. I no longer have their good will.

The CHAIRMAN. You have not lost your customers. They don't know whether you have been spending \$200,000 or less.

Mr. WALDO. They are represented on my board of directors.

The CHAIRMAN. As to how much you would have to spend in research work, the corporation will decide. This corporation that has not yet come into existence is going to decide, like any other corporation, how much they shall spend. If they want to spend \$250,000 they will spend that much, and if they want to spend \$25,000 they will spend that, and they have not violated any contract.

Mr. WALDO. But they have violated the intention of the contract.

The CHAIRMAN. I can not see that they have violated the intention of the contract when that is done. There is not anything in it that binds them to do it. The only objection I have to the argument of you fellows is that there are so many mysteries and uncertainties that God Almighty himself does not know about now. You can not know, Mr. Waldo, because it is not stated so in Mr. Ford's bid.

Senator HEFLIN. The Bible says God Almighty knows all things.

The CHAIRMAN. Well, there are some things that are not included in "all things."

Mr. WALDO. Here is one of the things that is included, Senator:

"To determine by research whether by means of electric furnace methods and industrial chemistry there may be produced on a commercial scale fertilizer compounds of higher grade and at lower prices than fertilizer using farmers have in the past been able to obtain, and to determine whether in a broad way the application electricity and industrial chemistry may accomplish for the agricultural industry of the country what they have economically accomplished for other industries, and if so found and determined, to reasonably employ such improved methods."

The CHAIRMAN. You say this corporation is going to spend \$250,000 a year on that provision of the contract?

Mr. WALDO. Probably more.

The CHAIRMAN. Now, I can't say that they won't spend \$40,000,000 on it. I couldn't say that. I couldn't deny it. But I do say that they are under no obligation by contract to spend \$250,000. You could determine in a broad way whether you could do that better this way or that way, and you could hire a man at \$500 a year, if you could get him that cheap, and say this corporation has determined on that as being a compliance with the contract, so far as that proposition is concerned. I do not say it in a critical sense, but I do say that there is no obligation there which requires the expenditure that would entitle you to include that \$250,000, yet you have included it in your figure—\$250,000 for a hundred years.

Mr. WALDO. Because that will certainly take the place of what you are now doing. Otherwise he would not be doing what the intent of the contract calls for.

The CHAIRMAN. Have you ever heard even Mr. Ford say that he expected to spend \$250,000?

Mr. WALDO. Yes sir; on one single process. He expects to spend \$250,000 on one single process. He has it to spend, and that is one reason why we are for Mr. Ford. Who else is going to do that?

The CHAIRMAN. Ford has not agreed to do it. Why doesn't he put it in the contract that he is going to spend \$250,000 a year?

Mr. WALDO. That is another matter.

The CHAIRMAN. Of course it is. He won't be bound to do it.

Mr. WALDO. Not for \$250,000, he may get the same results as the Government's \$250,000 a year laboratory for less than that expenditure, but he will be bound for a thing that he knows will probably cost him \$250,000 or more.

The CHAIRMAN. Let him put it in the contract. He won't put it in the contract, and he wouldn't sign it if it was in there.

Mr. WALDO. I am not in position to speak for him, but I would certainly think that he would be willing to do a thing of that sort as a matter of business.

The CHAIRMAN. I would like to see that. I am not finding fault with him because he does not say so. The fault I find is that you fellows who come in here make a contention on an indefinite thing of that kind and say he is going to spend \$250,000 a year on a research proposition, and there is not any place where you are even morally obligated to do it, let alone legally and technically, under your contract, and you won't do it.

Mr. WALDO. I don't think that question has been raised as to the exact amount of money to be spent in research work. He agrees to establish a commercial research laboratory. Knowing how he does things, I say that his laboratory will replace the Government's, and will save the Government the \$250,000 per year that it is now spending for this purpose.

The CHAIRMAN. This is another time we get back to this uncertainty. Nobody knows how much we ought to spend. It may be that when the thing gets started to going \$10,000 will be ample and sufficient, and maybe it will take \$500,000. Nobody knows now.

Mr. WALDO. If you would get the director of the fixed nitrogen research laboratory, Doctor Tolman, here to pass on that paragraph I believe he would be glad to tell you that in his opinion an honest carrying out of that proposition in accordance with the spirit and purpose and intention of this contract would call for as much money as he has spent, and \$250,000 per year is what he has spent.

The CHAIRMAN. That may be true to-day, and in 10 years from now it may take ten times that or one-tenth as much.

Mr. WALDO. But all the drift of development in scientific research along any line is toward the more complex, more complicated. It is not that we find that there is less to develop, but on the contrary, as one well-known scientist said, "I feel that I have been playing with a few grains of sand on a whole seashore of possibility." That is where we are. We have hardly begun to investigate those things as yet. We are merely kindergarten babes in this thing.

The CHAIRMAN. Oh, yes. I wish we had done more. I wish we were doing more now, and I think we ought to, and we are going to, in my judgment; but the fellow who finally discovers a cheap process, it may be by some method that won't cost 25 cents.

Mr. WALDO. To be sure. It has sometimes been true that those things have been stumbled upon in an entirely accidental way. But to-day you do not find that the successful inventor accidentally stumbles onto those things. Take the development of radio, for instance. Was that an accident that they discovered the audion tube? Yes, in a way, but it was an accident that happened to a man who had been investigating and who had surrounded himself with conditions whereby such a combination of circumstances could come about.

I think that is all, Senator.

The CHAIRMAN. All right, Mr. Waldo. I have been greatly interested in your testimony.

Senator HEFLIN. Mr. Waldo, just one question before you go.

You are convinced that Mr. Ford will make fertilizers in abundance at Muscle Shoals?

Mr. WALDO. Absolutely.

Senator HEFLIN. And that he will sell fertilizers to the farmer at a price very much cheaper than he has to pay for them to-day?

Mr. WALDO. Yes, sir. I think he can do it even if his costs per unit of plant food at that plant are no lower than those of other manufacturers, simply because of the saving in distribution of the concentrated material.

Senator HEFLIN. I feel that more people will be blessed and benefitted by accepting the Ford offer than any other disposition that can be made of Muscle Shoals. Is that your idea?

Mr. WALDO. Beyond question, and if you try to distribute the benefit over an electric wire, then you are distinctly limited in your area over which the benefit can be had as compared with distributing cheap and high grade fertilizers.

Senator HEFLIN. That is all.

The CHAIRMAN. We would be justified, then, I suppose, on the answer you gave to Senator Heflin, to announce on the floor of the Senate and to the people that if Ford gets this proposition the farmers will get fertilizer at one-half the present cost?

Mr. WALDO. I would call your attention to the fact, Senator, that in 1912 Mr. Frank brought it over to this country, testified to this committee that fertilizers could be

S. Washburn, the man who went abroad and obtained the cyanamide process and produced at about one-half of what the farmer would otherwise pay for them if the cyanamide process were installed at Muscle Shoals.

The CHAIRMAN. What connection has that with the Ford offer?

Mr. WALDO. Because it is the same plan and the same process applied under favorable circumstances.

The CHAIRMAN. Suppose the bill that I have introduced and that is now pending before the committee was passed and a governmental corporation were organized that did not want to make 8 per cent on fertilizer. Could they do the same thing?

Mr. WALDO. If you can get anything like an approach to the efficiency in a Government corporation that you can in the Ford organization, that is absolutely so, Senator.

The CHAIRMAN. Then this cheapening of the fertilizer proposition is not confined to Mr. Ford alone, is it?

Mr. WALDO. It is fundamentally based on the efficiency that you can get in a commercial operation.

The CHAIRMAN. What reason have you to think that this corporation which Mr. Ford will organize, after Ford dies, say 10 years from now, will be any more efficient than J. P. Morgan's corporation or John D. Rockefeller's corporation?

Mr. WALDO. Because I have a very healthy confidence in the intelligence of the farmers of this country, that when you put a thing like that in their hands, and they have some real reason for maintaining their organizations to protect their interests.

The CHAIRMAN. If Morgan had it it would be in their hands just the same, wouldn't it? What is the difference?

Mr. WALDO. But the policy of Wall Street is entirely different and apart from such a policy as this. Wall Street has not appeared with such an offer.

The CHAIRMAN. Entirely different from Mr. Ford's now. I agree with that. But I am asking you about this corporation after Mr. Ford is dead. How will it differ from Morgan's corporation or Rockefeller's corporation or the International Harvester Corporation?

Mr. WALDO. In all these United States, with the education and knowledge that there is on the part of the farmers of the country, if there can not be found seven men out of a total of nine who can administer a problem like that in the interest of all the farmers no matter whose the corporation is, then I say it is hopeless.

The CHAIRMAN. Yes. All right, let us take it that way. But who will be these seven out of nine men? Seven men that Morgan controls may be running it.

Mr. WALDO. If Mr. Morgan can get an appointment on a board like that—

The CHAIRMAN. Suppose Morgan owns the stock of the corporation. If Ford is dead, now, and the corporation that he has organized has got this. What difference is that corporation from any other corporation owned or operated by anybody else for profit or for money? I am not saying that any of them would be wrong, but I want to see that they get cheap fertilizer just the same when Ford is dead as they would if he was alive. What difference does it make on the fertilizer end of it, when Ford is dead and this corporation is like every other corporation? Where is the difference?

Mr. WALDO. The policy is fixed in the contract and the board that is set up maintains that policy regardless of how long Mr. Ford lives. You assume that his fortune will be dissipated and he will have to sell out.

The CHAIRMAN. No; it does not assume anything of the kind. It just assumes that the law of human nature will be in operation after Ford is dead the same as it is now; that when Ford is dead he will not have anything to say about it. That is as far as the assumption goes.

Mr. WALDO. All right. The policy is fixed and maintained independently of the length of Mr. Ford's life.

Senator HEFLIN. Mr. Waldo, you remember that Benjamin Franklin, who established the Saturday Evening Post, provided in his will that the paper should be sold on and on and on for 5 cents a copy, and it has been done ever since.

Mr. WALDO. That is true.

Senator HEFLIN. Mr. Ford could provide in his will instructions how that plant should be run, could he not?

Mr. WALDO. Undoubtedly.

The CHAIRMAN. Now, let me ask you a question about his will. Mr. Ford could also provide in his will, could he not, that on his death all the stock in this corporation should be turned over to the National Harvester Co.?

Mr. WALDO. Mr. Ford would hardly do a thing like that, but if he did the terms would still be fixed.

The CHAIRMAN. Exactly, but now there is where you come upon another uncertainty.

Mr. WALDO. But we are dealing with Mr. Ford now.

The CHAIRMAN. Of course we are dealing with Mr. Ford now, but Senator Heflin was asking you could he not do a certain thing, and you answered him that he could, and I am asking could he not turn it over to the devil, if he wanted to. Why are you so absolutely biased, you fellows, as to say when Ford is dead this thing is going on just as though Ford was alive, when you know better?

Senator HEFLIN. You could have said that same thing when Ben Franklin died.

The CHAIRMAN. You must know better. Do you think this corporation is going to be a Sunday-school proposition for a hundred years?

Mr. WALDO. No, sir. It is a definite contract, not simply a moral obligation.

The CHAIRMAN. It may be, I concede it now, but there is not any guarantee in this contract that it will be for 5 minutes after Ford is dead, and you won't put anything in the contract about that. You won't agree in writing even that Mr. Ford shall do so and so. Mr. Ford can turn around and make this fertilizer and sell it for nothing until his millions have been exhausted for the farmer, but he does not agree to do it.

Mr. WALDO. But he has agreed to limit his profits on the proposition.

The CHAIRMAN. To 8 per cent. Great God, if I had made 8 per cent on everything I did I would be a millionaire myself now.

Mr. WALDO. He considers 8 per cent a fair manufacturing profit, that is all.

The CHAIRMAN. I am not complaining about that, even if he made 10 per cent if he cheapened the product to the farmer. He made a good deal more than 8 per cent when he made automobiles, and he made automobiles cheap, and kept the price down, and did a great thing by it, but when you talk, and Senator Heflin talks, as you do continuously, about what is going to happen after Mr. Ford is dead, if you would brush away the cobwebs of prejudice for one moment you would know you are talking through your hat.

Mr. WALDO. Senator, I don't ask you to go one inch beyond this contract.

The CHAIRMAN. And I don't intend to. I would not have mentioned that if you had not put in those things that you did put in, and that you are putting in, you fellows that are spreading propaganda here.

Mr. WALDO. What, for example?

The CHAIRMAN. That you are going to sell fertilizer for one-half the present price.

Mr. WALDO. That is a reasonable expectation because that is the conclusion of experts who have studied the subject and who know the facts.

The CHAIRMAN. That is not peculiar to Ford's proposition at all, and there is no guaranty that Ford will do it, but Senator Heflin keeps repeating it, that Ford intends to cut the price in two.

Mr. WALDO. That is the reasonable expectation.

The CHAIRMAN. All right. Tell them that. Tell them, "We expect to do it, but we don't know." You tell them Ford is going to do it, but if he does it will be because of some new invention that comes along, which everybody hopes and prays will come along, but it has not so far.

Senator HEFLIN. The Wright boys said they were going to build a machine and fly in the air, and everybody said they couldn't do it, but they did.

Mr. WALDO. Senator, you have mentioned some propaganda on the part of the farmers in connection with this thing. I have one of the circulars, and I want to read to you what they are representing about this thing. They don't go out and say what you say they do. They do not say positively that he can cut the price of fertilizer. They use this language:

"A reasonable expectation from such a development would be the cutting of the farmer's cost of commercial fertilizer in half. Such a result would save the farmer \$100,000,000 a year and provide a lower cost factor in the production of food and clothing."

And, Senator, I don't want to leave you with the impression that the Tennessee River Improvement Association is endeavoring to read into the Ford proposal things that are not there. We are simply examining this thing from a reasonable standpoint. There will be things happen that none of us can foretell. But, as we all agree, under no plan that calls for a 100-year operation, on any project, can you tell what the results are going to be in the course of the years. Neither could you in a 50-year plan nor a 20-year plan nor a 10-year plan.

The CHAIRMAN. No, you couldn't; and the longer you make the term the greater the uncertainty, and the more careful we should be in entering into any arrangement. Congress fixed the time at 50 years because they had to fix some time, and that was a compromise. You can not go anywhere, under the Federal law, and build a dam on a navigable stream and get a lease longer than 50 years. The theory is, of all conservationists, that we ought not to give away these rights that we think belong to all the people of the United States, on such a long term that it is beyond human ingenuity to conceive, that it is beyond the power of the human mind to imagine what condition

will exist. Such strides have been made in invention in our lifetime, Mr. Waldo, in the last five years, that you are living in a different world every week, almost, and what is going to happen in the matter of fertilizer or water power or electricity in a hundred years from now is so uncertain that nobody knows what it is. We all believe they are going to be greatly improved, and I don't want to take any step that will foreclose unborn generations in whatever rights they may want to assert.

Mr. WALDO. But we do know, from the record, from 1896 to 1920 the Federal Government has spent over \$700,000,000 for the improvement of its navigable streams, and never got a cent.

The CHAIRMAN. Most of it thrown away.

Mr. WALDO. Yes, sir. I agree with you.

The CHAIRMAN. Yes, sir; I think so.

Mr. WALDO. We all agree if they accept the Ford proposal we will have a water power developed, and one in which 4 per cent is guaranteed to the Government for all that time, whatever may be the reduction in the value of the property, or whatever may be the commercial vicissitudes.

The CHAIRMAN. But that is no answer to the uncertainty.

Senator HEFLIN. You feel the best way to serve the next generation is to begin with this one, don't you?

Mr. WALDO. Yes, sir; and substitute a certainty for an uncertainty.

Senator HEFLIN. You think Mr. Ford can take that water that is going to waste and serve more people than any of these companies or people that are fighting him in getting this project?

Mr. WALDO. The record shows we can not certainly expect anything of that sort from them.

Senator HEFLIN. You realize that the power companies and fertilizer companies are all fighting him, don't you?

Mr. WALDO. There is no question about that. They are out in the open on it.

Senator HEFLIN. They have had several witnesses before this committee that have fought it. Some of them admitted they didn't want him as a competitor.

The CHAIRMAN. Now, Mr. Hefflin, that is very unfair. I have no particular friendship for the fertilizer people, but that is perfectly natural, and they never went further than that. It is perfectly natural that any man in the business wants to prevent competition if he can.

Mr. WALDO. If he has been doing his duty as a business man, then I have not a word to say, but the fertilizer business is right where it was 50 years ago, Senator. They are employing those same old methods that they used then.

The CHAIRMAN. All right. I don't care anything about them, as far as the Ford proposition is concerned. I have nothing to do with them. I don't care anything about them. But I don't want to misrepresent them, even though I have no friendship for them.

Mr. WALDO. Neither do I, for a moment.

The CHAIRMAN. And the cry made all the time about the great combination. I want to make a proposition right now to Senator Hefflin who is continually saying there is a fertilizer trust—and I am not denying it, but if there is, for God's sake let us prove it in the regular way. Give me the names of the witnesses, and I will send for any one of them, and you can cross-examine them. That is the way to do it.

Senator HEFLIN. Let the Attorney General get after them. I am simply saying here what the testimony has disclosed. I have asked witnesses myself.

The CHAIRMAN. Senator, the witness who is the head of it, if there is such a thing, was here, and you sat right here and never asked him a question.

Senator HEFLIN. I don't know about that, but I remember one or two questions, and he testified that he went from California to Muscle Shoals at his own expense.

The CHAIRMAN. No. He testified that the California commission paid his expense, and I tried to show from his testimony that that was unfair, that they had no right to do it, and that the consumers of electricity out in California had to pay for it.

Senator HEFLIN. That shows a combination fighting Ford.

The CHAIRMAN. I think it is an outrage, myself. The man who is at the head of this supposed fertilizer trust I examined in every way I knew how to throw light on the matter as to whether there was a fertilizer trust. He testified that if there was a fertilizer trust he was the head of that trust.

Senator HEFLIN. Mr. Chairman, you wouldn't expect him to admit that he had a trust?

The CHAIRMAN. Certainly not; but I tried to examine him to show just what those things were and Senator Hefflin sat there, and I supposed with all his ability and his knowledge about the fertilizer trust he would be able to put questions to him that would put him in a hole and show there was a trust, but he didn't do it.

Senator HEFLIN. I don't remember this particular witness, but if I did not question him any I didn't believe what he was saying, and I didn't want to have anything to do with his testimony.

The CHAIRMAN. Well, now, Senator, when we examine a witness on the witness stand that we believe is not telling the truth, that is the time we go after them on cross-examination.

Senator HEFLIN. Why did I want to fill up the record and take up the time to ask him any questions, the man who is supposed to be the head of the trust, whether he has got a trust or not?

The CHAIRMAN. No, but when you get that man on the stand that is the place to learn everything about the trust.

Senator HEFLIN. But all the farmers of the country that have been held up year after year by this combination know, and to illustrate the point:

"The toad beneath the harrow knows
Precisely where the tooth point goes;
But the butterfly along the road
Preaches contentment to that toad."

The CHAIRMAN. Do you mean to insinuate that I am the butterfly, now, and you are the toad?

Senator HEFLIN. Not at all, but the farmer is the toad, and these other fellows are running the harrow down there, and they are getting it in the back, and the toad is groaning, but the butterfly flits around and says, "You ought not to complain; it's a nice day."

The CHAIRMAN. When this butterfly came on the witness stand and Senator Heflin sat down there and did not ask him a single question all the time he was testifying they will begin to wonder what is the matter.

Senator HEFLIN. If I did not cross-examine him at all they will know what the reason was.

Mr. WALDO. There is what is known as the National Fertilizer Association, with headquarters in Philadelphia, and they have been sending out a series of colored circulars attacking this whole plan, to the Members of Congress. And there have been many others.

The CHAIRMAN. All right, and it may be that some of them have come to me. I have not read one in twenty of what has come to me. I have said to Senator Heflin, and I make the same proposition to you now, let us get the witnesses here and go into this Fertilizer Trust question. You give me the names of the witnesses that will prove it, or may be you have the knowledge. If so, tell us about it.

Mr. WALDO. I will be very glad to supply the literature we have on the opposition to this thing, but it does not prove that there is a fertilizer trust. In my opinion, whether there is or not is beside the point entirely.

The CHAIRMAN. I think so myself, but we are hearing it continually asserted. I would like to have it proved.

Mr. WALDO. I have never so stated.

The CHAIRMAN. Oh, haven't you?

Mr. WALDO. No, sir. I have said the fertilizer people were against this thing, but whether they have what can be called a fertilizer trust or not is another matter. But that does not make any difference. They get the same results as if they did have a trust.

The CHAIRMAN. I don't think it matters whether there is a fertilizer trust or not. If we can cheapen fertilizer, we ought to do it.

Senator HEFLIN. You will find in Senator Butler's printed testimony, my recollection is, that he talked about the Fertilizer Trust, and how it would help to relieve the farmers even if they accepted his bid. A number of the witnesses that I questioned, I said something about relieving them from the Fertilizer Trust, and they said, "Yes, that is right." Nobody ever disputed that they had a trust.

The CHAIRMAN. When you ask a witness a question "Would you like to be relieved from the Fertilizer Trust and get your fertilizer at one-half the price?" then you assume you have proved there is a Fertilizer Trust.

Senator HEFLIN. If there was no trust I would expect him to say, "There is no Fertilizer Trust, but I would like to get fertilizer cheaper."

The CHAIRMAN. He is speaking about getting fertilizer cheaper, and he says, "Yes, I would like to get it cheaper."

Senator HEFLIN. The main thing we have here is to dispose of Muscle Shoals to the best advantage, in a way that would serve the most people. Of course I would love to have this trust investigated, but I don't see that that is a very important point in determining whether we accept Ford's offer or not.

The CHAIRMAN. If there is a fertilizer trust that is increasing the price of fertilizer to the farmer, we ought to bring out the evidence and demand their prosecution and send them to jail.

Mr. WALDO. What we have in mind, Senator, is not a matter calling for prosecutions at all. It is simply that we have a set of economic conditions that are such that we are paying more for fertilizer than is necessary.

The CHAIRMAN. That may all be true, Mr. Waldo, but it is continually being charged here, "Why, the Fertilizer Trust has got the farmers in its grip, and we have got to do something down there in order to change it." I think the evidence demonstrates here—and I am sorry it does not demonstrate to the contrary—that under all known conditions and processes now known by scientific men we can not, even at nitrate plant No. 2, cheapen the cost of fertilizer without new or improved methods being discovered, and my only hope lies in new discovery. I think it has got to come before we can get a material reduction.

Senator HEFLIN. Mr. Ford claims he has got that now.

The CHAIRMAN. Oh, no; Ford has not said that he has got that. That is what you say all the time.

Senator HEFLIN. The witnesses have so testified.

The CHAIRMAN. That is another thing you people are continuously harping on. You are leading the people to understand that Ford has a secret process by which he is going to cut the price of fertilizer in two, and there really is not any evidence that he has it.

Mr. WALDO. In my opinion it is not necessary to use any secret process whatever to accomplish the result you mention.

The CHAIRMAN. If you have a secret process that will cut the price of fertilizer in two and you won't use it, you are not even patriotic; and if you have a secret process and are still going to keep it secret and not utilize it, you ought to go to jail.

Mr. WALDO. How are you going to tell whether your secret process will do what you think it will do until you have an opportunity to try it out under commercial conditions and see whether it will or not?

The CHAIRMAN. You can't tell.

Mr. WALDO. Exactly, and we have never represented that the half-priced fertilizer was based on any secret process Mr. Ford may now have. But it is based on the fact that fertilizers are now being manufactured under present commercial methods, and in commercial forms that are well known to the trade, and everybody who is familiar with those things knows you can cut your price of fertilizer in half through distribution economies, using definite, well known methods. Mr. Swann testified with respect to one of those processes with respect to phosphoric acid. The Haber process for ammonia is another.

Senator HEFLIN. Didn't you hear Mr. Mayo's testimony?

Mr. WALDO. I certainly did.

Senator HEFLIN. Didn't he say Mr. Ford had a process by which he expected to do this?

Mr. WALDO. He did.

The CHAIRMAN. I can not conceive of the workings of a man's mind who will say that, or his representative. He does not say it himself. Somebody else comes here and says it for him, that he has a secret process by which he is going to reduce the cost of fertilizer and save the farmer, and he will use it if you will give him a contract for a hundred years by which he can make millions and millions every year, but he won't put it in writing. There is no agreement to that effect, but somebody told me that somebody else said that Ford told him that he had a process that would do it, and therefore we will give this to him without any agreement to that effect whatever. Now, that is what you are doing.

Mr. WALDO. He simply asks an opportunity to show what he can do, Senator.

Senator HEFLIN. He is willing to put in his money and go down there and try it.

The CHAIRMAN. Senator Hefflin here is always saying, "Don't you understand Ford has a secret process," and Ford in your mind is pretty near a saint; and if he is and he has got that kind of a secret process and he does not tell the farmers, who are suffering beneath the load and in the clutches of this great fertilizer trust that has been so often pictured, he is a demon instead of a philanthropist, and instead of being given a favor he ought to be sent to jail for the balance of his life and ought to spend the remainder of time in purgatory.

Mr. WALDO. You are not quoting correctly either Mr. Ford or his representatives, Senator.

The CHAIRMAN. I am not quoting him at all, but that is the insinuation.

Mr. WALDO. Cheaper fertilizers are certainly a reasonable expectation under the Ford offer on the part of those who know what Mr. Ford has done in the past.

The CHAIRMAN. What would you say to me if I said, "Give me two or three hundred million dollars on the possibility that I will be able to make fertilizer at one-tenth the present cost"? And Ford says to give it to him—Ford does not say it; I will say that to his credit—but Ford testifies that they think that might happen, and then Senator Heflin says, "Well, it is proven in the testimony here that Ford would cut that price down one-half." Would you give it to me, take my word for it if I told you that, and would you let me have this great snap because I have told some people that I am going to cut it down lower than he does? We haven't any assurance that anybody will cut it down. Let us face the truth. I believe if Ford gets it he will cut it down, and I think if this bill passes and we get our scientific men at work, they will cut it down. I believe that if anybody gets it improvement will come about by which they can cut it down. I have just as much faith in cutting it down as anybody has, and just as much interest, but, my good heavens, Henry Ford is not the only source to heaven. There may be other ways of getting there, and he doesn't know anything more about it than anybody else.

Senator HEFLIN. I have in mind a man cutting wheat with a single scythe. Another man comes along and says, "I am going to invent a mowing machine that will cut that wheat all in one day. It takes now a number of men with one scythe, working all day, to cut that field." They say he can not do it. But he has made this machine that cuts the wheat from this field. The man just sits up there and rides up and down that field, and he cuts the whole field in a day. Suppose you get the fellow that said they could not improve it.

The CHAIRMAN. But that fellow did not say, "Give me a hundred million dollars."

Mr. WALDO. Neither does Mr. Ford.

Senator HEFLIN. Ford says, "I will take that plant and make fertilizer and sell it at half the cost. I can do it. I have seen the other process. I will improve on it."

The CHAIRMAN. Why doesn't he go on and do it on his own responsibility? Why not go out and take a dam at some other place on the Tennessee River? There are hundreds of other places. Why has he not done it in Detroit, if he wants to do it?

Senator HEFLIN. The idea is suggested that he has a process. He won't do that, because he won't give it to the other fellow. He is waiting to get hold of this thing. That would be ridiculous.

The CHAIRMAN. Why not give it to the country? A man of his intelligence and means, if he had such a secret as that, would give it to them without any quibbling.

Mr. WALDO. If he knew what it would do, Senator.

The CHAIRMAN. Of course. That is the secret of it.

Mr. WALDO. Mr. Ford is in position where he gets scores of inventions brought to him every day, but we believe he can cut the price of fertilizer in half by means that are well known to science to-day.

The CHAIRMAN. Why doesn't he do it? He doesn't have to have Muscle Shoals to do it. Why does he want Muscle Shoals? Is there anything attractive there?

Mr. WALDO. The necessary conditions are there, Senator.

The CHAIRMAN. He is getting from the Government what cost them over \$100,000,000 for \$5,000,000.

Senator HEFLIN. If he does get it we will take the chairman of the committee down there and let him see what he is doing, and then he will be sorry that he stood in the way.

(Whereupon, at 1.30 o'clock p. m., the committee adjourned subject to the call of the chairman.)

MUSCLE SHOALS.

WEDNESDAY, JUNE 21, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to call, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), Capper, Gooding, Ladd, Harrel, McKinley, Smith, Kendrick, Heflin, and Caraway.

The CHAIRMAN. The committee will come to order.

Before the witnesses proceed, I want to read into the record a communication which I have received as chairman of the committee, from the War Department.

(The chairman thereupon read the following letter, with its inclosure:)

WAR DEPARTMENT,
Washington, June 15, 1922.

HON. GEORGE W. NORRIS,
Chairman Agricultural Committee,
United States Senate, Washington, D. C.

MY DEAR SENATOR: I inclose herewith, for your information in connection with the question of disposing of the nitrate plants at Muscle Shoals, Ala., copy of a letter from the Air Nitrates Corporation which explains itself.

I feel that you should be informed of the stand taken by this corporation with reference to the opinion of the Attorney General on contract No. T-66, dated June 8, 1918.

Sincerely yours,

J. M. WAINWRIGHT,
The Assistant Secretary of War.

AIR NITRATES CORPORATION,
New York, June 1, 1922.

The honorable SECRETARY OF WAR,
Washington, D. C.

DEAR SIR: The Attorney General of the United States has rendered an opinion under date of May 25, 1922, to the effect that a certain contract, No. T-66, bearing date June 8, 1918, by and between the Air Nitrates Corporation and the United States, under which the Air Nitrates Corporation constructed and operated nitrate plant No. 2 at Muscle Shoals, Ala., during the war emergency, is invalid in so far as it grants to the Air Nitrates Corporation a prior right to purchase said plant in the event of a decision to sell said plant.

We hereby notify you that, in our opinion, the said preferential clause is a valid and binding obligation of the United States and, therefore, we intend to take such proceedings as may be necessary to protect our interests in the event that the proper governmental officers decide to dispose of said plant without regard to our legal rights.

Respectfully,

AIR NITRATES CORPORATION,
By J. O. HAMMITT, Vice President.

The CHAIRMAN. The members of the committee will remember that there were two contracts, one with the Alabama Power Co., by which an agreement was made to sell the interest of the Government in the Gorgas plant, and another contract was with the Air Nitrates Corporation, by which they agreed to give the Air Nitrates Corporation a preferential right to purchase nitrate plant No. 2 in case the Government decided to sell it. This letter, of course, bears directly on that proposition.

I will read into the record also a communication from Colonel Cooper, who has already testified, and who was the consulting engineer in the construction of the dams. Major BURNS. He was designing engineer and in control of construction.

The CHAIRMAN. Yes; and he has been in control of all that has been done on the dams.

Major BURNS. Practically all.

The CHAIRMAN. After he testified it occurred to me that there was one proposition involved in the consideration of this question that had not been touched upon much, scarcely touched upon at all by any of the witnesses, and I wrote a letter to Colonel Cooper, asking him to submit in writing his estimate, and so that the committee will understand the whole question I will read my letter directed to Mr. Cooper.

(The chairman thereupon read the letter referred to, as follows:)

WASHINGTON, D. C., June 12, 1922.

Col. HUGH L. COOPER,
101 Park Avenue, New York City.

MY DEAR COLONEL COOPER: I was anxious to get your estimate of the cost of maintenance of Dam No. 2 and Dam No. 3 at Muscle Shoals for a period of 100 years. Under Mr. Ford's offer he keeps in repair the power house, its substructure, superstructure, machinery, and appliances, but it is distinctly stated that the Government shall make all necessary repairs and do everything necessary for the maintenance of the dam proper as well as the locks. It is, of course, perfectly proper that the Government should keep the locks in repair because they will use them more than Mr. Ford, but under Mr. Ford's bid the Government is responsible for the maintenance of Dams 2 and 3 and the only contribution Mr. Ford makes is \$35,000 annually during the period of lease of Dam 2 and \$20,000 annually during the period of lease of Dam 3. I am very anxious to get your opinion as an expert as to the probable cost of the maintenance of these two dams during the 100-year period. Would this maintenance cost likely increase as time went on and the dams became older? Your early reply will be very much appreciated.

With best personal regards, I am,
Sincerely,

The CHAIRMAN. Here is Colonel Cooper's answer to that letter which I have not read myself, but which I will read now to the committee. It is directed to me.
(The chairman thereupon read the following communication:)

NEW YORK, June 20, 1922.

Hon. G. W. NORRIS,
Committee on Agriculture and Forestry, United States Senate, Washington, D. C.

DEAR SENATOR NORRIS: This will acknowledge receipt of your inquiry of June 12, regarding the sufficiency of Mr. Ford's proposed allowance for maintenance and operation of \$35,000 annually during the period of lease of Dam No. 2, and \$20,000 annually during the period of lease of Dam No. 3.

You have asked me for my opinion as an expert as to the sufficiency of the above two allowances for the yearly period of approximately 100 years, covered by the proposed lease to Mr. Ford.

Paragraph 4 of Mr. Ford's proposal contains the following:

"The company will further pay to the United States during the period of the lease of Dam No. 2, \$35,000 annually, in installments quarterly in advance, for repairs, maintenance, and operation of Dam No. 2, its gates and locks; it being understood that all necessary repairs, maintenance, and operation thereof shall be under the direction, care, and responsibility of the United States during the said 100-year period."

Paragraph 8 of Mr. Ford's proposal uses the same language with respect to Dam No. 3, except that \$20,000 is the annual payment.

In my recent testimony before your committee I was asked by either your good self or some member of your committee, as to the sufficiency of the above two sums of \$35,000 and \$20,000, respectively. I replied, as a rough estimate, not based upon any definite analyses of the subject, that the allowances were about one-half what they should be.

Since the receipt of your letter of June 12, I have composed the following analyses of the sufficiency of these two allowances, and beg to submit the same for your consideration, the analyses being made up in exactly the same way as I make up similar estimates for clients in private practice.

The tables below are based upon the following assumptions:

(a) That masonry per se will require practically no renewals or maintenance disbursements, if it is properly put in in the first place.

(b) That all metal work, moving and stationary, will have to be renewed every 40 years.

Figuring the value of money at 4 per cent compounded annually, assumption (b) requires an amortization charge of 1.05 per cent against first cost, to be invested yearly to take care of renewals at the end of the 40-year period on the further assumption that the renewals at the end of the 40-year period can be made at the same cost as the original cost at the time the work was installed.

On the above basis the estimated cost of the operation and maintenance of the two locks for Dam No. 2 is as follows:

LABOR.

1 lock superintendent, per annum.....	\$2, 000
1 assistant lock superintendent, per annum.....	1, 800
6 lock tenders (3 shifts, 8 hours each, 2 men per shift), at \$1,200 per annum..	7, 200
3 engineers (1 per shift to operate both lock gate engines and engine on bascule bridge), at \$1,400 per annum.....	4, 200
3 engineers for compressor plant (1 per shift), at \$1,200 per annum.....	3, 600
Annual minor repairs and miscellaneous supplies, grease, oil, waste, electric light supplies, etc., including painting of 12 lock gates every third year....	2, 800
Annual repairs and painting of valves, cleaning lock chambers, and cofferdam placements incident thereto.....	3, 000
Renewals at end of 40-year period, all metal work, initial cost of which will be \$336,000, \$336,000 at 1.05 per cent.....	3, 528
Total charge against lock system.....	28, 128

OPERATION AND MAINTENANCE OF DAM NO. 2.

1 superintendent, per annum.....	\$1, 800
6 men (2 per shift, 3 shifts), at \$1,200 per annum.....	7, 200
Annual repairs to 63 gates and their operating mechanisms, and incidental supplies thereto, including painting every 3 years.....	12, 000
Amortization of all metal work on basis of 40-year life, \$960,000 at 1.05 per cent.	10, 080
Probable annual expense of apron renewals, and inevitable apron extensions at toe of dam.....	14, 000
Annual minor repairs to masonry in bridge and overfall structure.....	3, 000
Operation of barge, and amortization and maintenance thereof to handle driftwood, per annum.....	2, 000
Total.....	50, 080
Add annual cost of locks.....	28, 128

Total maintenance and operation allowance that should be made for Dam No. 2 and its locks (excluding main power house).....	78, 208
Mr. Ford's allowance for this item.....	35, 000

Discrepancy..... 43, 208

The foregoing estimates of costs are as low as any experienced estimator would make them. In support of this statement attention is invited to the fact that at Keokuk, Iowa, a new modern lock with practically no traffic and with no trouble with its masonry and lock gates whatsoever and with no charge for amortization at the end of the 40-year period, has cost the Government of the United States for the last nine years an average annual cost for operation and maintenance of \$17,829 for one lock only, as against two locks at Muscle Shoals, each of greater lift than at Keokuk. In my estimates I have allowed for the minimum operating staff that could be used with the idea that navigation on the Tennessee River will be very light for many years to come.

As to the sufficiency of the \$20,000 allowance for the operation and maintenance costs of Dam No. 3 and its locks, I think you will be quite safe in assuming that the actual costs at Dam No. 3 will be that same percentage of the above costs detailed for Dam No. 2, as the operating head at Dam No. 3 is of the operating head at Dam No. 2. The normal operating head at Dam No. 2 is 94 feet. The normal operating head at Dam No. 3 is 38 feet, or slightly less than 40 per cent of the operating head

at Dam No. 2. This percentage of 40 applied to the costs for Dam No. 2 gives us \$31,283.20 as the estimated allowance for the maintenance and operation of Dam No. 3. This figure of \$31,283.20 is to be compared to Mr. Ford's allowance of \$20,000 for the same item.

My total estimated annual costs for Dams 2 and 3, with their locks, become as follows: Dam No. 2, \$78,208; Dam No. 3, \$31,283.20; total, \$109,491.20.

Mr. Ford's allowance for these same items is \$55,000, which is a ratio of practically 2 to 1.

NOTE.—With respect to the use of 40 per cent ratio for the cost of Dam No. 3, in the absence of definite plans for Dam No. 3, this 40 per cent ratio is probably as rational an assumption as can be made at this time.

You asked the question, "Would this maintenance cost likely increase as time went on, and the dams became older?"

The maintenance cost of the metal work would increase as time went on, but if the dams themselves are taken care of in the way the estimates above specified require, then the maintenance costs should never increase as time went on.

With reference to your statement, "It is, of course, perfectly proper that the Government should keep the locks in repair because they will use them more than Mr. Ford."

The only possible observation that I would make with respect to the view you have expressed is the one that Mr. Ford's proposal is so worded as to convey the idea that allowance of \$35,000 per annum for Dam No. 2 is sufficient for the purposes he specified. The phraseology he uses is, therefore, again misleading, and as such is quite in harmony with his original proposal of July 8, 1921, in which he very adroitly says in paragraph 1, "6 per cent on the remaining cost of the locks, the dam and power-house facilities, taken at \$20,000,000," and in paragraph 6, with reference to Dam No. 3, "6 per cent on the cost of the dam, lock, and power-house facilities, taken at a cost of \$8,000,000."

The reader of the proposal of July 8, 1921, would conclude from the phraseology of Mr. Ford's letter that Dams Nos. 2 and 3 required but \$28,000,000 to complete them as of July 8, 1921, when as a matter of fact the actual cost to complete these two structures can not be taken as less than \$50,000,000.

Similarly, anyone reading paragraphs 4 and 8 of Mr. Ford's proposal as it is now before the Congress, would conclude that the cost of operation and maintenance for the two dams would be \$55,000, when as a matter of fact, in actual experience, the cost to somebody would be at least the figures I herewith submit.

I regret exceedingly the delay that has occurred in replying to your inquiry of June 12, the same being caused by my absence from the office on the Pacific coast, from which absence I returned yesterday morning. If there is anything further I can do for you in this matter, or any other matter, either in the way of further reports or in the way of an interview with you in Washington, I should be very glad to respond. My present engagements are such that I will be here in New York or the immediate vicinity for the next 30 days.

I have been deeply impressed all along with your very earnest desire to get to the bottom of this whole vexed question, and to thereafter fearlessly compose a solution that would result in the greatest good to the greatest number of our people, and if there is any way in the world that I can aid you in the purposes I know you possess, I certainly am yours to command.

With much esteem, believe me,

Yours very truly,

HUGH L. COOPER.

Senator CARAWAY. May I ask a question, Mr. Chairman?

The CHAIRMAN. Yes.

Senator CARAWAY. It strikes me that his letter discloses one thing, where he wants to give us the impression that he is telling us something else, that practically the entire cost of maintaining has to do with the locks. It is conceded that Ford has nothing whatever to do with the locks.

The CHAIRMAN. Personally, I do not think Mr. Ford ought to keep the locks in repair, or anybody else.

Senator CARAWAY. This man was undertaking to give us the impression that this cost was the cost of maintaining the dam when, as a matter of fact, there is not anything about the dam, according to his own statement.

Senator SMITH. I notice there that he is speaking of metal work in connection with the dam. That would be the expense. So far as the dam itself is concerned, it would practically not require any annual expenditure, but as the Senator from Arkansas intimates, he has gotten the two things together in such a manner that we do not clearly see just what will be required with respect to the dams.

Senator HARRELD. Let me ask a question. Maybe it will clear up the matter.

Senator SMITH. It seems to me if the locks are to be used by the Government and not by Mr. Ford, as the chairman here intimates, the Government should keep up the locks, and what we are interested in knowing is what will Mr. Ford use and what would be necessary for Mr. Ford to expend to get the use out of the property that he is to use.

Senator CARAWAY. And that was the very question that Colonel Cooper tried to cover up in his letter.

The CHAIRMAN. I think in Colonel Cooper's figures—I had never read them until I read them aloud to you—you will find that you will be able to determine or differentiate between the locks proper and the dams proper. It is a mistake to think, as the discussion seems to indicate, that there is no metal work in the dams proper. There is an immense amount of it. There are gates all the way across, are there not, Major Burns?

Major BURNS. Practically all the way across. Over the overflowed section of the dam.

The CHAIRMAN. I suggest that we do not discuss that now. That will be like all the other evidence.

Senator CARAWAY. All right.

Senator HARRELD. Let me ask a question, the answer to which may shed light on it. Is this cost of upkeep included in Mr. Ford's plan of amortization.

The CHAIRMAN. No. In Mr. Ford's proposition he agrees to keep in repair the machinery end of the dam. What is the technical designation of that, Major?

Major BURNS. Generating equipment, power house.

The CHAIRMAN. Yes. He agrees to keep that in repair, where the machinery is.

Senator SMITH. The power house?

The CHAIRMAN. The power house; yes. He agrees to keep that in repair, and the Government must keep in repair the balance of the dams, but Ford pays, in one case, \$35,000 a year and in the other case \$20,000 a year. Ford does not do it, but the Government, under his bid, would be the guarantor to do it, and would do it itself, and keep it in repair. What I was trying to get was the differentiation between the cost of the locks proper and the dam proper, to see whether that was a fair contribution. But there will be some more evidence on it. I have made the same inquiry of some other experts, and they will testify.

Senator HEFLIN. What is your opinion, Mr. Chairman, that Ford is to keep up Dams No. 2 and 3?

The CHAIRMAN. He pays the \$35,000 in the case of one dam and \$20,000 in the case of the other.

Senator SMITH. Just before you pass from the letter of Colonel Cooper, it seems Mr. Ford was not so far out of line, according to his own figures, because when you subtract the upkeep of the locks from the other it leaves about \$55,000 that Mr. Ford proposes to spend in the upkeep of a dam that he himself will use.

Senator CARAWAY. Of course, in the Cooper letter he figures the cost of operation of the locks; not only the cost of upkeep, but the cost of operation.

The CHAIRMAN. We met particularly this morning under a prior understanding that the Alabama Power Co. wanted to be heard on the legal aspect particularly of their contract, and you may proceed, Mr. Martin.

ADDITIONAL STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT ALABAMA POWER CO.

Mr. MARTIN. Mr. Chairman, there are several points that I wish to bring to the attention of the committee in connection with this subject.

There was recently transmitted to the committee a letter by the Secretary of War stating, in substance, that the Alabama Power Co. had offered \$2,500,000 for the Government's interest in the Warrior steam plant and the other facilities connected with that situation in which the Government had made an investment. That, of course, is correct, and we did make the offer to the Secretary of War to pay in cash \$2,500,000 for the Government's interest, and we stand ready and willing to carry out the purchase of the Government's interest.

At a hearing before the House Military Affairs Committee Major Burns, representing the Ordnance Department, stated in substance that in his opinion the fair value of the Government's interest in those facilities was \$3,000,000. The contract which we have with the Government provides, in substance, that the value of these facilities should be arrived at by arbitration. The Attorney General holds, in substance, that the Secretary of War had no power to agree to an arbitration of the value of these

facilities. Waiving aside the legal authority involved for the moment, we expressed to the Secretary of War, and we now express to this committee, our desire to negotiate with the Government with a view of reconciling what differences there may be between our offer of \$2,500,000 and \$3,000,000, and we wish to make that statement to this committee and place it definitely upon the record, that we are prepared to negotiate with the Government on those figures.

The CHAIRMAN. You have very definite knowledge about the value of the Government's interest there and are probably in a better position to know definitely than Major Burns is. I would like to ask you now if it is your judgment that Major Burns's testimony is about right in the matter of the valuation of that plant.

Mr. MARTIN. Mr. Chairman, I could only express it is this way: It depends altogether on the assumptions you would make as to the cost of reproduction of properties of this kind and the level of prices that you used. We might assume the cost of reproduction to be 70 per cent, whereas another engineer will say that the trend of prices is downward and that the cost of reproduction should be 60 per cent or 50 per cent. Another engineer might say the cost of reproduction is probably stationary where it is, and having arrived at a figure of cost of reproduction, it is a question of taking off the accrued depreciation.

The CHAIRMAN. Now, Mr. Martin, the cost to the Government was over \$4,000,000. In fact, it was nearly \$5,000,000.

Mr. MARTIN. The facilities here involved about \$4,750,000.

The CHAIRMAN. Yes; that is about it. I suppose it would be admitted on the one hand that it was built at a time when the cost was high and you could build it cheaper now.

Mr. MARTIN. Yes, sir.

The CHAIRMAN. But so far as depreciation is concerned, with the exception, perhaps, of the transmission line, which is comparatively a small part of the value, there has been really no depreciation, has there?

Mr. MARTIN. It has been maintained in the highest state of order and efficiency, but there is always, Mr. Chairman, accrued depreciation in any machinery.

X Senator McKINLEY. Ten per cent on boilers.

Mr. MARTIN. Ten per cent per annum; yes. You would probably arrive at some figure between 10 per cent and 15 per cent for the whole plant for depreciation.

The CHAIRMAN. Assuming the cost of reproduction is the same now as it was when it was produced, the depreciation would not exceed 10 per cent, would it?

Mr. MARTIN. Yes, sir. I think that accrued depreciation would range between 10 per cent and 15 per cent.

You would arrive at that figure, Mr. Chairman, depending upon judgment; \$2,500,000 in some points of view and \$3,000,000 is not an unfair figure from other points of view. I simply say that if the Government officials finally conclude that in their judgment \$3,000,000 is the fair value, and nothing less, of course there is nothing else for us to do but to agree upon it, and if we do agree upon it, I believe the Public Service Commission will recognize that value for rate-making purposes, and we will be prepared to meet the Government's figures. I say that frankly, because I feel satisfied that there will be a reasonable desire by the Government officials and our company to get at a fair figure when this question is finally closed.

Senator HEFLIN. In other words, if the Government will not take two and a half million you will give three million?

Mr. MARTIN. If the Government insists upon \$3,000,000 as the fair value, we will give them \$3,000,000; yes, sir.

Senator HEFLIN. You haven't any doubt about what they are going to insist on, have you?

Mr. MARTIN. Yes, sir; I have; because I think we will be able to convince them that \$3,000,000 is not the fair value.

Senator SMITH. Does it not amount to this: It doesn't make much difference to the Alabama Power Co., because you expect to use that for rate-making purposes, and expect to pass it on to the people?

Mr. MARTIN. Therefore the Government, I think, ought not and would not insist upon an unreasonable amount.

Senator SMITH. I say it does not make much difference to the Alabama Power Co. because they are going to make it or use it for a basis of making their charge.

Mr. MARTIN. Yes; it make a great deal of difference, because if the Government should demand \$4,000,000 for it I am quite sure our commission would not recognize \$4,000,000 as the value of the property.

The CHAIRMAN. Assuming that that is agreed to by your company and the Government, that the Government wants to sell it to you, in reaching the value you ought

to, and would not the Government want to, bring the Alabama officials who have supervision over your rates into consultation? If they are convinced that \$3,000,000 is a fair value it seems to me that it is. I am not an expert, but looking over the plant and the condition it is in, I think Major Burns has been very fair in his estimate. If the Alabama officials coming into the negotiations now would consent, as the Senator from Arkansas says, it would not be very material to your company, if they would consent, and I agree with you, too, that the Government ought not to require a valuation there that would be so great that the people, who have in the end to pay the bills, could not afford to do it. They ought to be fair with you.

Mr. MARTIN. There is a point of balance, Mr. Chairman, that you well express, and the Senator from Arkansas has referred to, and we have had to bear that in mind, because as a public institution, as we are, we have to look at it from all these points of view.

Senator HEFLIN. Of course the money invested in the cost of production of power and light you have to figure on, and you are entitled to figure on it.

The CHAIRMAN. Yes; that is perfectly proper, and, on the other hand, if they got it at a very much reduced price they could be held and ought to be held to reduce their cost to the consumer correspondingly. If they get a bargain out of it, the people who buy electricity ought to get the benefit of it.

Mr. MARTIN. So I believe, Mr. Chairman, that the question is one that can be solved within reasonable limits on both sides.

I want to bring up next this question:

In earlier discussions of this contract the statement was made that the authorities dealing for the Government in its making violated section 124 of the national defense act in that that act laid certain restrictions upon creating properties intended to be operated jointly with private institutions. The Attorney General has gone into that question and overruled the Judge Advocate General completely and holds that section 124 of the national defense act has nothing to do with this question; that the authority under which the construction was done was not section 124 of the national defense act, but that the authority is in other acts referred to, the Attorney General using this language:

"* * * In the first place, the nitrate plants were built not under the \$20,000,000 appropriation above mentioned, but under entirely different appropriations made to meet the war emergency, the contract not being in fact signed and delivered until November, 1918. And in the second place, the facilities just mentioned were brought into existence merely to furnish electrical energy, so that the plants might be operated. In no just sense, therefore, can it be said that the furnishing of electrical power to run these plants was an operation prohibited by the national defense act."

The Attorney General further held in effect that the power and authority to deal with this property—that is, to sell it, or sell the Government's interest—was, by virtue of the act of July 9, 1918, conferred upon the President, acting through the head of any of the departments, and that power still exists to deal with it. Therefore it comes right back to this, that the power which was vested in the Secretary of War by the President is still vested in the Secretary of War, and, if the Attorney General is correct in that the Secretary, through his department, did not properly exercise this power by this contract, we say that the power still exists in the Secretary to be exercised.

When this subject was referred to the House and Senate by the Secretary of War, it was referred upon the assumption that the Congress would have to pass enabling legislation to get away from section 124 of the national defense act. We have always considered that was an error, a legal mistake. The Attorney General sustains us completely, and I would like to put into the record at this point certain orders of the President out of which arose this possible confusion. It grew out of the fact that in the fall of 1917 the Secretary of War concluded that the Government did not have the power or authority to purchase lands under the then existing laws, for the nitrate plant. He requested the President to allot a certain amount of money from section 124 of the national defense act appropriation for this purpose. The President made the allotment by an order dated November 23, 1917. He increased it by an order of March 8, 1918. In the meantime there was passed an act of April 11, 1918, which, among other things, enabled the Government to acquire lands "For the construction and operation of plants for the production of nitrates and other compounds and the manufacture of explosives and other munitions of war, and for the development and transmission of power for the operation of such plants."

Senator CARAWAY. May I ask a question there?

Mr. MARTIN. I think I ought to conclude this point, Senator Caraway.

Senator CARAWAY. Under which authority was this property acquired? Under the power given to the President in the special appropriation, or was it under the act of Congress of 1918?

Mr. MARTIN. That is what I want to tell you.

Following the passage of the act of April 11, 1918, Colonel Joyes testified that before it came to the payment for the first parcel of land or any parcel of land at nitrate plant No. 2, this act of April 11, 1918, was passed, and the Judge Advocate General considered that act authorized moneys appropriated by general appropriation acts to be used for the purchase of necessary land for the producing of munitions of war and the building of nitrate plants, and thereupon the President made an order completely revoking the orders previously made which had made allotments for the purchase of lands for that purpose.

Senator CARAWAY. Was none paid for out of that fund?

Mr. MARTIN. None at all. Not a dollar. On the contrary, Colonel Joyes testified that the lands were purchased and paid for following this act of April 11, 1918, from general appropriation acts. He further testified that the Warrior extension and all of those facilities were paid for completely from appropriation acts and in fact, Senator, there never was any order made by the President authorizing any part of section 124 funds to be used in connection with the Warrior matter. There was \$340,000 authorized to be used in connection only with the purchase of lands for the nitrate plants, by the President, nitrate plant No. 2, which, as I stated, the President revoked.

Senator CARAWAY. Now, let me ask you, did the work proceed, however, under section 124 of the national defense act, or under the general appropriation?

Mr. MARTIN. Under the general appropriation acts, the lands being paid for from those acts under authority of the act of April 11, 1918.

Senator CARAWAY. That is where you state it was paid for; but it was authorized under the power of the President contained in the national defense act, or was it under the act of Congress?

Mr. MARTIN. Under the acts of Congress I have mentioned.

Senator CARAWAY. Wasn't it already in being before that time?

Mr. MARTIN. Nitrate plant No. 1 did proceed under section 124 of the national defense act.

Senator CARAWAY. But nitrate plant No. 2—was not that authorized before the act of Congress?

Mr. MARTIN. All of the funds for nitrate plant No. 2—

Senator CARAWAY. Not the funds. I am talking about the act of the Government in determining to construct the property. That was before the act of Congress.

Mr. MARTIN. According to Colonel Joyes, he proceeded under the general appropriation act.

The CHAIRMAN. I don't think you understand Senator Caraway's question. He wants to know where the authorization came from to begin this operation?

Senator CARAWAY. Yes. When did the Government determine to construct the plants and operate them? That was before the act of Congress of April 11, 1918? Major Burns, can you answer that?

Major BURNS. That was an ammunition plant, nitrate plant No. 2, and it was started in conformity with the money appropriated under the Army fortifications bill, the Army fortifications act passed in 1917.

Senator CARAWAY. The thing that I had in mind, Major, was that the determination of the Government to construct these plants as nitrate plants originated before the act of Congress of April 11, 1918.

Major BURNS. Yes, sir.

Mr. MARTIN. Mr. Chairman, I will hand to the stenographer the orders to which I have referred, if you wish to have them in the record.

The CHAIRMAN. Does any member of the committee want these orders in the record?

Senator HEPLIN. I suppose we had better let him put them in.

The CHAIRMAN. All right. I have no objection to it. I do not care for them, so far as I am concerned.

Mr. MARTIN. These are copies of the original orders and, as stated, the Attorney General concluded that the Warrior situation was not governed in any way by section 124 of the national defense act.

Colonel Joyes testified that this section, together with the statutes requiring written approval of the title by the Attorney General and cession of jurisdiction by the State, were held to be restrictions upon this general power of the Government to purchase land, and that all of these restrictions led to consideration of just what means could be taken for the purchase of the land necessary for nitrate plant No. 2.

Thereupon the Secretary of War requested the President to allot funds from the appropriation made by section 124 of the national defense act with which to purchase land for the nitrate plant No. 2, which request is as follows:

WAR DEPARTMENT, *November 23, 1917.*

DEAR MR. PRESIDENT: 1. I have the honor to recommend that \$200,000 be allotted to the War Department out of the \$20,000,000 appropriated by section 124 of the national defense act, approved June 3, 1916, for the purpose of purchasing a site for an ammonium nitrate factory to be constructed and operated under appropriations for the procurement of explosives for military purposes, under control of the Ordnance Department, United States Army.

2. It having become apparent that a large quantity of ammonium nitrate will be urgently needed for the conduct of the war during the ensuing year and thereafter, arrangements have been made for the construction and operation of a plant for such manufacture, the expense of such construction and operation being properly chargeable to appropriations for procuring explosives. But the procurement of the site for such factory is not properly chargeable to such appropriations.

3. As the product of the plant in question will be strictly within the description, "Nitrates or other products needed for munitions of war and useful in the manufacture of fertilizers and other useful products," as used in section 124 of the act approved June 3, 1916, which further specifically authorizes the acquisition of land for the production of such materials, the allotment of the funds as asked is manifestly proper.

Very sincerely,

NEWTON D. BAKER,
Secretary of War.

The President.

Approved:

WOODROW WILSON, *President.*

NOVEMBER 22, 1917.

It will be noted that the \$200,000 requested was for the purpose of purchasing a "site" for the nitrate factory, which, however, was "to be constructed and operated under appropriations for the procurement of explosives for military purposes, under control of the Ordnance Department, United States Army." Subsequently a further allotment of \$150,000 was made, as follows:

MARCH 8, 1918.

MY DEAR MR. PRESIDENT: Under date of November 22, 1917, you approved an allotment of \$200,000 out of the appropriation of \$20,000,000 provided in section 124 of the national defense act approved June 3, 1916, for the purpose of purchasing a site for an ammonium nitrate factory, known as United States nitrate plant No. 2. The Acting Chief of Ordnance now requests that an additional allotment of \$150,000 be made, under this appropriation, for the purchase of additional land, it having been found necessary to purchase a larger piece of land for this plant than was originally contemplated on account of the topography of the site, the relation of the plant to the railroad, and to reduce to a minimum the effect of unavoidable dust from the plant on adjacent property.

The Acting Chief of Ordnance also requests that \$250,000 be allotted from the same appropriation for the purchase of a site for the erection of an additional nitrate plant to be known as United States nitrate plant No. 3.

The appropriation of \$20,000,000 above referred to is the only appropriation applicable for the purchase of land for United States nitrate plants.

Very respectfully,

BENEDICT CROWELL,
Acting Secretary of War.

The President,

White House, March 12, 1918.

Approved and authorized.

WOODROW WILSON.

An act had been passed July 2, 1917 (40 Stat. L. p. 241), authorizing condemnation proceedings to acquire lands for certain military purposes, but Colonel Joyes testified (hearings, 1050) that this act was so construed that no authority was conferred to acquire land for the nitrate plant, and this authority remained unchanged until the act of April 11, 1918, which amended the act of July 2, 1917, by adding the words: "For the construction and operation of plants for the production of nitrates and other compounds and the manufacture of explosives and other munitions of war and for the development and transmission of power for the operation of such plants," causing the act to read as follows:

"That the Secretary of War may cause proceedings to be instituted in the name of the United States, in any court having jurisdiction of such proceedings for the acquirement by condemnation of any land, temporary use thereof or other interest therein,

or right pertaining thereto, needed for the site, location, construction, or prosecution of works for fortifications, coast defenses, military training camps, and for the construction and operation of plants for the production of nitrate and other compounds and the manufacture of explosives and other munitions of war and for the development and transmission of power for the operations of such plants; such proceedings to be prosecuted in accordance with the laws relating to suits for the condemnation of property of the States wherein the proceedings may be instituted: *Provided*, That when the owner of such land, interest, or rights pertaining thereto shall fix a price for the same, which in the opinion of the Secretary of War shall be reasonable, he may purchase or enter into a contract for the use of the same at such price and without further delay: *Provided further*, That the Secretary of War is hereby authorized to accept on behalf of the United States donations of land and the interest and rights pertaining thereto required for the above mentioned purposes: *And provided further*, That when such property is acquired in time of war, or the imminence thereof, upon the filing of the petition for the condemnation of any land, temporary use thereof or other interest therein or right pertaining thereto to be acquired for any of the purposes aforesaid, immediate possession thereof may be taken to the extent of the interest to be acquired and the lands may be occupied and used for military purpose and the provision of section 355 of the Revised Statutes, providing that no public money shall be expended upon such land until the written opinion of the Attorney General shall be had in favor of the validity of the title, nor until the consent of the legislature of the State in which the land is located has been given, shall be, and the same are hereby suspended during the period of the existing emergency." (Federal Statutes Annotated, second edition, 1918, Supplement, p. 166.)

Colonel Joyce testified (p. 1055 of hearings) that before it came to the payment for the first parcel of land for nitrate plant No. 2 the act of April 11, 1918, referred to above, had been construed by the Judge Advocate General's Office to authorize moneys appropriated by the general appropriation acts to be used in the purchase of the necessary land for producing the munitions, and in due course, and before any of the funds were used, the President revoked his previous orders (hearings, p. 1072) allocating the \$350,000 for this purpose in a memorandum as follows:

MARCH 13, 1919.

Memorandum for the Secretary of War:

I hereby authorize and direct the following revocation and allotments of funds appropriated by the Congress in the "section 124, nitrate supply," of the act approved June 3, namely:

Revoked:

The sums allotted by me November 27, 1917, and March 2, 1918, for the purchase of a site for an ammonium-nitrate factory, aggregating \$350,000.

Allotted for use by the Secretary of War:

- | | |
|---|----------|
| (a) For the purchase of United States patents protecting processes incident to nitrogen fixation, etc..... | \$10,000 |
| (b) For the active prosecution of investigation of processes for the industrial production of nitrate compounds useful in the manufacture of explosives or fertilizers..... | 340,000 |

Approved, April 8, 1919.

WOODROW WILSON, *President*.

A certified true copy, April 30, 1919.

P. B. CONVILLE,

Lieutenant, Ordnance Department, United States Army.

A true copy of a certified copy, signed by P. H. McConville, lieutenant, Ordnance Department, United States Army.

G. B. ATTERSALL.

(Purchase of site for United States nitrate plant No. 2, "Nitrate plants, Secretary of War, allotment F.").

February 4, 1919, P. R. 117960, procurement request No. 2487, apportionment \$350,000.

May 10, 1919, revocation nitrate No. 27, F 112.4, procurement request No. 2487, apportionment \$350,000. (2878.)

The CHAIRMAN. The Attorney General did hold that the provision in the contract with you for the sale of the Government's interests in the Gorgas plant was illegal.

Mr. MARTIN. Yes, sir. He held this, Mr. Chairman: The Attorney General did hold that the Secretary of War could not agree to arbitrate the value under the act of 1918.

Mr. DENT. Or to grant an option?

Mr. MARTIN. Yes; or could not grant an option.

The CHAIRMAN. Did he not hold that they could not sell it?

Mr. MARTIN. No, sir.

The CHAIRMAN. Then his modification of the opinion of the War Department's legal advisor was to the effect that the arbitration part of the contract was null and void?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. But that the Secretary could sell the plant?

Mr. MARTIN. Yes, sir.

Senator CARAWAY. But he did hold that your contract was void, but he went further and said now if the Secretary wanted to sell it to you he had the power to do it, but he was under no legal obligation to do it by reason of the contract.

Mr. MARTIN. Now, Senator, just a moment. He held that that feature of it which gave us the option to require the Government to convey it to us was not binding on the Government.

Senator CARAWAY. That is what I meant.

Mr. MARTIN. Yes, sir; but he did not hold that the other feature, namely, the feature requiring the Government to demand of us to buy before it sells to some one else, was not binding.

Senator CARAWAY. Yes.

Senator HEFLIN. I supposed Mr. Dent was going to discuss that at length.

Senator CARAWAY. That would be in effect holding that on one leg of the option you are bound and on the other you are not.

Mr. MARTIN. Now, Mr. Chairman, the only point that is important for us to determine under that opinion is simply as to whether the Alabama Power Co. is bound to pay the arbitration value or fair value of the property. Now, curiously, we find ourselves in this position. We never contended that we were not bound—in fact, have always contended that we were bound in good faith to carry out all of our obligations under the contract, and have been and are ready and willing to carry them out. Certain officials of the Government have contended that we were not bound by certain provisions. We stand ready to pay any award made by the arbitrators. If you will examine Article XXIV of the contract, you will find that any award signed by two of the arbitrators is final and conclusive, and in common law and on every principle of jurisprudence we would be subject to suit by the Government to recover the amount of the award. From your own State, Mr. Chairman, there came the Supreme Court opinion in one of the leading cases on this subject, namely, the *City of Omaha v. Omaha Waterworks* (218 U. S. 180), in which case the Supreme Court of the United States held the city of Omaha was bound by the result of an arbitration to buy a waterworks system where the arbitration was entered upon and an award made, and a bill for specific performance was sustained to require the city to execute the award. We have never considered we were not bound by the result of the award.

The CHAIRMAN. Let me see if I get that right. As I understand you, now, the position of the Alabama Power Co. is that you are willing to go ahead under the contract?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Or you are willing to go ahead without that provision and buy if you can agree on a price?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And you will let the Government take either course it wants to?

Mr. MARTIN. That is correct, Mr. Chairman.

There is one other thing, Mr. Chairman, in the offer of the Alabama Power Co., which I want to make clear to the committee. We have proposed a plan under which this Wilson Dam might be completed and 100,000 horsepower made available to the Government or its designee or its nominee. It has been suggested in the testimony that there would be required an amount of primary power continually available in connection with the operation of nitrate plant No. 2. I understand it is the idea that 10,000 horsepower should be continually available if the balance of the plant is to be operated upon secondary power. Now if some plan seems feasible from the Government's point of view for working this matter out on the basis of 100,000 horsepower, I just want to say that so far as we are concerned the 10,000 continuous primary power and 90,000 secondary power would be a plan which could be worked out, that is, the 100,000 continuous primary power to be available, and the balance on the basis of secondary power. That would be a substantial increase in the value of the power to be made available to the Government, and would, of course, meet one of the points that has been suggested before the committee, that the secondary power might interfere at times with the proper maintenance of the plant.

Senator MCKINLEY. To put it in plain figures, at least to my mind, your suggestion is that the Alabama Power Co., or your suggestion has been that the Alabama Power Co. would put up the money itself to complete Dam No. 2, and you now say that as rental for the right to use Dam No. 2 the Alabama Power Co. would provide 10,000 of primary steam power, if necessary?

Mr. MARTIN. Continuous power from any source.

Senator MCKINLEY. And then 90,000 horsepower of secondary power. Now, what I want to ask you is on the average, as has been shown there in the water supply, for how many months of the year would the Government have available 90,000 horse power?

Mr. MARTIN. From nine to ten months.

Now, Mr. Chairman, I want to make this further statement:

Our company is engaged in the generation and distribution of power in Alabama. We have a very large power load which we are serving to the public in many parts of the State. That power load is continually increasing from week to week in response to the demands of the present industries and new industries. For instance, we have in negotiation to-day, power negotiations to-day, with various coal mines, iron ore mines, municipalities, public utilities, steel mills, textile plants and miscellaneous industries, involving 76,825 horsepower connected load.

Senator MCKINLEY. Your statement about negotiations is confusing to me. Do you mean that that is new business you have in sight?

Mr. MARTIN. Yes, sir; this is new business we have in sight which, of course, is in addition to our present load which we are carrying, Senator, of approximately 160,000 horsepower. We have entered upon a program, in other words, of taking on new business, because we are building a large power plant of 110,000 horsepower, and we want to have the load available for that plant when it comes in next year, and we can not carry this big load this year even with the Warrior plant. We have rented from the Government the steam plant at Sheffield to enable us to carry this load this year and possibly part of next. The Sheffield plant is rented, of course, under an arrangement terminable at will by the Government, but we are doing this in response to the demand of industry for power in Alabama, and because, naturally, we want to build up a load to absorb the power we bring into the market.

This very large load of power which we deliver goes into industry very largely in our State. I want to give you, Mr. Chairman, some idea of the basic industries which are dependent upon this source of power.

We have 57 coal mines in Alabama that are now electrified. These mines produce an annual output in value of coal at present prices of \$18,000,000.

Pig-iron mines electrified, with an annual output of approximately \$15,000,000.

Two very large cement plants, with an annual output in value of \$8,000,000.

More than 50 per cent of all the textile mills of our State, with an annual output of approximately \$40,000,000.

A ferrophosphate and phosphoric acid plant at Anniston, with an output of \$2,000,000.

Miscellaneous plants and industries which we have roughly estimated at \$50,000,000, making a total of approximately \$133,000,000 in value of the annual output of plants that are electrified and have come onto the system of the Alabama Power Co. upon the understanding and agreement with us that they would have continuous service of power. Stated in another way, these plants have more than \$300,000,000 of investment, employing approximately 25,000, having under normal conditions an annual payroll of \$75,000,000.

Senator HEFLIN. You mean you are serving these industries from all of your plants?

Mr. MARTIN. Yes, sir. And, Senator, if the proposal made by Mr. Ford to take the Warrior Plant should succeed it will have a very disastrous effect upon industries in Alabama, and not alone our company. It will react into this great industrial situation in Alabama, and our company has, in response to demand, extended its lines and its service to practically all parts of industrial Alabama. Now, we can not, on a water-power plant, carry this load, or anything like it. It is going to take steam plants to do it, because, as you know, the Coosa River runs down very low in summer, and that is a very vital question to the industrial situation in Alabama to-day and in the future.

Senator HEFLIN. You know, as I said in the outset, I would not favor depriving those coal mines that are now being served by the Gorgas plant of that service, it doesn't make any difference who gets it.

Mr. MARTIN. Yes, sir; and I just want to say to you, Senator, that the only way by which you can take any part of the Warrior plant is to take it all, and those on the other side recognize it, who are demanding this plant. If you did that industrial Alabama would be very vitally affected, and you would see it all over the State where electric power is now an essential industry.

The CHAIRMAN. What kind of contracts do you enter into with those municipalities and those various industries, mines, etc., as to time? Can you terminate those contracts?

Mr. MARTIN. No, sir. We can not. Those contracts vary in term. They run for 5 to 20 years. Our company is obligated to deliver service and—

The CHAIRMAN. Under the laws of Alabama how long a contract can you make?

Mr. MARTIN. There is no limit to the time.

The CHAIRMAN. There is no limit?

Mr. MARTIN. No, sir; there is no limit except on the—

The CHAIRMAN. If Mr. Ford's offer was accepted and he took the Government's interest in the Gorgas plant, and if you were able to show that because that was done you were unable to comply with your contracts, would not you be able to recoup yourself? Would not the Government be liable not to you alone, but to your licensees?

Mr. MARTIN. Well, I should think that if there should be a condemnation suit, or a suit to take away these properties, that is an element of damage which will have to be taken care of.

Senator CARAWAY. Let me ask you a question. In your contract that you make with the coal mines, for instance, are you obligated to furnish them power for 20 years?

Mr. MARTIN. It depends upon the terms of the contract.

Senator CARAWAY. If the contract is for a 20-year term, you make a contract that you will furnish power for 20 years?

Mr. MARTIN. Do we?

Senator CARAWAY. Yes, sir.

Mr. MARTIN. Yes, sir.

Senator CARAWAY. Are there not provisions under which you can get out?

Mr. MARTIN. No, sir.

Senator CARAWAY. Suppose the public service commission were to order you to reduce your rates and you would say you could not do it; what would be the result?

Mr. MARTIN. That would not make any difference so far as concerned our obligation to continue to furnish power.

Senator CARAWAY. Well, what would be the result?

Senator McKINLEY. The result is they would appeal to the courts.

Mr. MARTIN. That question of rate does not determine the question of whether we shall furnish continuous service, because the rate regulating bodies now have the power, within constitutional limits, to decrease or increase rates of such companies as Alabama Power Co.; and all contracts we make are in law made with that legal power inherent in the contract. We have to deliver service at a rate to be fixed by the commission, subject to review in the courts.

Senator CARAWAY. Suppose you should determine that you can not deliver. You go in the courts and refuse to deliver, don't you?

Mr. MARTIN. No, sir; we can not refuse to deliver service. The question of rates is another matter, Senator.

Senator CARAWAY. Have you a sample of your contract with you?

Mr. MARTIN. No.

Senator CARAWAY. Will you give us one to be put into the record?

The CHAIRMAN. Are your contracts all the same?

Senator CARAWAY. If you make that kind of a contract, I never heard of any other company that did.

Mr. MARTIN. We are relieved from acts of God from delivering service and from breakdowns temporarily.

Senator CARAWAY. Strikes, and everything else? I have been somewhat familiar with it and I have never seen one yet but what there were so many exceptions that the company could get out of it. If you have a different one, I would like to see it.

Senator McKINLEY. I should say we have plenty of them, and there is no way to get out of them except for strikes or acts of God. You can not get out just because you want to.

Senator CARAWAY. You say you can't, but you have so many conditions you can always get out of it. You put one of yours in, and let him put one of his in.

Senator McKINLEY. I think it would be a good idea to shut down all of these plants in Alabama and let Mr. Ford have it.

Senator CARAWAY. And let you and other private plants run so that you can make money. I understand it thoroughly.

The following is the contract between Alabama Power Co. and Stith Coal Co., Mr. A. B. Aldridge, one of the witnesses appearing to-day, being secretary and treasurer of the company:

CONTRACT FOR ELECTRIC POWER—WHOLESALE RATE, THREE-PHASE ALTERNATING CURRENT, NOT LESS THAN 50 KILOWATTS.

Agreement made this 26th day of February, 1918, by and between Alabama Power Co., hereinafter called the "company," and Stith Coal Co., hereinafter called the "consumer."

In consideration of the mutual agreements hereinafter contained, it is agreed:

First. That during the term of five years from the beginning of service (not later than the 1st day of May, 1918), and thereafter until the expiration of at least six months written notice to either party of intention to terminate this agreement, the company shall maintain ready for delivery to the consumer at a division switch located at the power house at the mine Stith Coal Co., section 26, township 15, range 7, in Walker County, Ala., electric power of a capacity of 150 kilowatts, in the form of approximately 60 cycles, three-phase, alternating current, at a pressure of approximately 2,300 volts, for which the consumer shall pay a charge of \$1.25 per kilowatt per month, based on the consumer's maximum average five-minute load during such month; provided, however, that such load shall be figured at not less than 75 per cent of the maximum average five-minute load during the 11 preceding months; and provided further, that during the first year (or during the year following any increase of capacity as hereinafter permitted) such load shall be figured at not less than 75 per cent of the capacity required to be maintained. At no time shall such charge be for less than 50 kilowatts.

Second. That in addition to the charge for capacity, which shall be paid even though the service may be suspended or interrupted as hereinafter mentioned, the consumer shall pay a charge for energy, based on the number of kilowatt hours actually consumed each month, in accordance with the following schedule: For the first 1,000 kilowatt hours, or less, per month, 3 cents per kilowatt hour; for the next 3,000 kilowatt hours, or less, per month, 2 cents per kilowatt hour; for the next 16,000 kilowatt hours, or less, per month, 1 cent per kilowatt hour; for the next 30,000 kilowatt hours, or less, per month, 0.6 cent per kilowatt hour; all above 50,000 kilowatt hours, per month, 0.4 cent per kilowatt hour.

Third. Bills shall be rendered monthly, and if not paid at the company's office within 10 days the company may, upon 5 days' written notice, suspend service; and if not paid within a further period of 15 days the company may, at its option, treat this agreement as canceled and at an end, whereupon all rights of the consumer hereunder shall cease.

Fourth. If at any time the consumer desires to increase the capacity required to be maintained, 60 days' written notice thereof shall be given to the company, which shall then make the required increase; provided however, that the total increase shall not exceed 50 kilowatts during any six consecutive months, and provided further, that the company shall not be required to make any increase within one year next preceding the expiration of this agreement.

If for a period of 12 consecutive months the capacity required to be maintained exceeds by over 10 per cent the consumer's maximum average five-minute load during the same period the company may, upon 30 days' written notice, decrease the capacity by the amount of the overexcess, subject to increase again only as provided.

If at any time the consumer's maximum average five-minute load shall exceed the capacity then required to be maintained the company may so notify the consumer, and, upon any subsequent excess, without further notice, suspend service until such time as it is satisfied that the consumer will thereafter keep within said capacity. And the consumer shall be liable for all damages resulting to the company by reason of any such excess or excesses. The company may interrupt the service without notice at any time a momentary overload shall exceed said capacity by more than 75 per cent or by more than 25 per cent in case said capacity shall be over 400 kilowatts.

Fifth. Without the written consent of the company the consumer shall not use any electric power other than that furnished hereunder, or any other power where that furnished hereunder has once been used; nor shall the consumer sell or dispose of any power furnished hereunder, or which may be generated directly or indirectly therefrom.

Sixth. All transformers, transmission lines, switches, machinery, and materials up to and including the division switch, and all the company's meters wherever placed, shall be supplied, maintained, and owned by the company, at all times open to it for inspection, repair, or alteration, and removable at its option; and the consumer shall supply without charge suitable buildings and accommodations therefor. Everything beyond the division switch shall be supplied, maintained, and operated by the consumer with a view to securing a power factor satisfactory to the company, and shall be subject at all times to the inspection, testing, and approval of the company in so

far as the same may in any way affect the safe, economical, and successful operation of the company; and no change which might affect such operation shall be made without its approval.

The consumer shall use reasonable diligence to protect the property of the company, shall reimburse the company for injury or damage suffered by it resulting from defects beyond the division switch, or from the negligence of the consumer, and shall indemnify it against liability for injury or damage so suffered by third parties; and except as herein provided the company shall not be liable for any accident, damage, or injury to any person or property whatsoever arising out of or in any way connected with the service furnished or to be furnished hereunder.

The consumer shall allow the company free access and entry to the consumer's properties and premises, and shall, upon request, convey to the company in fee, or otherwise, to the fullest extent that the consumer's interest may permit, convenient locations and right of way for such transmission lines as may be required for service to the consumer and to others who may be most economically served therefrom.

Seventh. The obligations of the company are dependent upon its securing and retaining the necessary rights, privileges, franchises, and permits, and in the event that it is delayed in the delivery of power by injunction, strike, riot, invasion, flood, fire, accident, breakdown, delay in obtaining material or apparatus, or any cause beyond its control, the time fixed for the commencement of the term of this agreement shall be correspondingly extended. The company shall not be liable to the consumer for interruptions in the service due to any of the causes aforesaid, but shall use the utmost reasonable speed in restoring the service, and during such interruptions the consumer shall have the right to use such other power as may be available.

Eighth. A waiver of one or more defaults shall not be considered a waiver of any other or subsequent default.

Ninth. Before this agreement shall become binding upon the company it must be approved in writing indorsed below, by an officer of the company. All previous communications between the parties hereto, whether verbal or written, with reference to the subject matter of this agreement, are hereby abrogated, and no modification hereof shall be binding unless it shall be in writing duly accepted by the consumer and approved by an officer of the company. This agreement shall inure to the benefit of, and be binding upon, the successors and assigns of the parties hereto.

ALABAMA POWER CO.,
By D. H. CRONHEIM,
Commercial Agent.
STITH COAL CO.,
Consumer.

By A. B. ALDRIDGE,
Secretary and Treasurer

Approved.

ALABAMA POWER CO.,
By W. M. WALMSLEY,
Vice President.

The foregoing is one of the company's standard forms of contract for wholesale power.

Senator MCKINLEY. Let me ask you, do you have to pay taxes in Alabama?

Mr. MARTIN. We had a 10-year tax exemption on our Lock 12 hydro-electric plant, which expires this year. However, we paid last year approximately \$145,000 of taxes on our properties which were not exempt. This amount of taxes will be substantially increased hereafter. Some classes of property are still exempt from taxation but beginning with this year we will pay taxes on all.

Senator MCKINLEY. Does the public utilities commission control your rate?

Mr. MARTIN. Yes, sir. Rates, service, and security issues.

Senator CARAWAY. And permits you to charge off your taxes, of course, as an expense, and you raise your rates to meet it.

Mr. MARTIN. That is a part of the operating expense, you know.

Senator CARAWAY. The question was intended to leave the impression that the taxes were given to the State.

Senator MCKINLEY. The impression I wanted to make later was that Mr. Ford pays no taxes.

Senator CARAWAY. The impression was that this thing was a gift also to the State, and the State would lose \$140,000, and the question was obvious.

Mr. MARTIN. Of course we have to pay taxes in future even on that property which was exempt, and we will continue to pay. As Senator Heflin knows, that is simply a 10-year exemption, and it runs out this year.

Senator HEFLIN. The State passed a statute years ago, as an inducement for industry to come into the State, that it should be exempted for a period of 10 years, and your contract has about expired.

Mr. MARTIN. Yes, sir. I would like to put into the record some lighting and power rates charged by our company in Alabama and some comparable rates charged in other cities in the South and North. I don't want to take the time of the committee unnecessarily to go into that. If the committee wants to do it, I will, but if not, I will put it in the record, and also some power rates.

The CHAIRMAN. Let me ask you, how many municipalities do you supply with light?

Mr. MARTIN. Directly and indirectly, 63.

(The statement referred to is as follows:)

In a report recently prepared by Messrs. Murray and Flood on the development of electric light and power utilities in Ontario it is shown that the Ontario utilities, which are government owned, furnish power at an actual average cost of 9.25 mills per kilowatt hour generated. The Alabama Power Co. in 1921 generated power on a comparable basis for 7.5 mills per kilowatt hour, or practically 20 per cent less than the efficient Canadian plants.

In 1914, the connected system load was 7,500 horsepower, used by five customers. The market demand has steadily increased until at the close of 1921 the company had a total connected load of 370,000 horsepower, and an annual output of 500,000,000 kilowatt hours, serving 158 major industries in 25 counties in Alabama, as follows:

Industries and number at close of 1921.

Brick plants.....	2	Electrochemical plants.....	1
Cement plants.....	2	Municipal lighting systems.....	3
Cotton mills.....	30	Municipal pumping systems.....	3
Coal mines.....	46	Public utilities.....	18
Cotton gins and oil mills.....	7	Lime and marble quarries.....	8
Foundries and machine shops.....	11	Steel plants.....	4
Graphite plants.....	5	United States Government.....	2
Ice plants.....	7		
Ore mines.....	9	Total.....	158

The above industrial consumers utilize 70 per cent of the total kilowatt-hour output of the company, the balance being absorbed by residential customers, street lighting, and street railway operation.

More than 80 per cent of the power output is absorbed in industry, and much of it is bought in large blocks of from 5,000 to 25,000 horsepower.

Rate schedules are low and compare favorably with rates in other sections and are such that manufacturers are enabled to secure not only efficient motive power but at prices that reduce cost of production.

The power rate includes a minimum demand charge of \$1.50 per kilowatt, plus a charge for energy commencing as low as 5 mills, ranging upward. This energy charge naturally goes down as the amount of kilowatt hour consumption goes up. During 1921 the average returns of the company on all power sold was only 8.9 mills per kilowatt hour.

In 1907, before there were any large power developments in Alabama, the average horsepower cost per year was \$72. In 1917 this had decreased to \$21, or 70 per cent in 10 years. On the other hand, in the adjoining State of Mississippi, during the same period the per horsepower cost only decreased from \$97 to \$93, or 4 per cent. The latter State has no hydro power, which accounts for and illustrates the effect on power costs in communities where hydro power is made available.

The Alabama Power Co. is delivering power at considerably less than \$18 per horsepower year. This figure is as low and in many instances lower than the rate in any other section of the country. The average charged rate per horsepower year by the hydroelectric power commission in Ontario is \$21. This rate, however, increases with the distance from the generating plant until, in isolated sections, it is as high as \$151 per horsepower year, while the Alabama Power Co. serves its customers regardless of location at a standard rate.

Lighting and power service is being furnished to 63 cities and towns, over an area of 25,000 square miles, 36 being served directly by this company. Current is carried long distances over high tension transmission lines and through substations, stepped down to low voltage for use by residential consumers. The communities served directly by this company range in population from 500 to 30,000 and the town limits

are almost invariably widely extended for future growth. Notwithstanding the fact that each community must have a separate operating and distributing system, the lighting rates of the company are as low as in Chicago, Detroit, and many other large cities where the utilities serve congested districts with from 100 to 500 per cent more consumers per mile of line. Our lighting rate, of 9 cents per kilowatt hour and gradually decreasing to 4.5 cents per kilowatt hour in proportion to the consumption, is more than a fair one to the consumer and is only possible through modern equipment and a skilled organization.

Power is sold by the Alabama Power Co. to several municipalities in Alabama, which then in turn distribute to consumers. It is worthy of notice that these municipalities, without exception, charge higher rates than the Alabama Power Co. Several of these are indicated herewith, together with rates of cities in other sections:

Rates per kilowatt hour (in cents).

Alabama Power Co.....	9	Detroit, Mich.....	10
Lafayette, Ala. ¹	15	Chicago, Ill.....	10
Piedmont, Ala. ¹	12	Atlanta, Ga.....	9
Opelika, Ala. ¹	12	Columbia, Tenn.....	13.2
Sheffield, Ala.....	14	Jackson, Tenn.....	14.2
Baton Rouge, La.....	11	Chattanooga, Tenn.....	9
New Orleans, La.....	9.1	Athens, Ga. ¹	9
Greenville, Ala.....	14	Columbus, Ga.....	10
Meridian, Miss.....	11.7	Lagrange, Ga. ¹ (hydro).....	12
Hattiesburg, Miss.....	14	Waycross, Ga.....	11.7
Vicksburg, Miss.....	15	Pensacola, Fla.....	11.4

Mr. MARTIN. Now, Mr. Chairman, with your consent, I would like very much to get Mr. Aldridge, who is a business man in our state, to make a short statement. He is in the room.

The CHAIRMAN. Before this witness testifies I want to ask the present witness or Senator HEFLIN in regard to that exemption. Does that apply to all factories of all kinds?

Senator HEFLIN. Yes, sir. That is my understanding.

The CHAIRMAN. Is it still in existence?

Senator HEFLIN. Yes, sir.

The CHAIRMAN. If anyone else went down there and started a manufacturing site anywhere in Alabama they would be exempt from taxation for 10 years?

Mr. MARTIN. I had reference to the statute which granted an exemption to any person, firm, or corporation developing electric power, being section 2069 of the Code of Alabama of 1907.

Senator HEFLIN. Yes, sir. I remember a cotton factory, for instance, in 1907. I think the statute provided that any cotton factory that came into the State would be exempt for 10 years.

The CHAIRMAN. If Mr. Ford, for instance, built an automobile factory, would that be exempt for 10 years?

Mr. MARTIN. There is no law of that kind now.

The CHAIRMAN. There is not any exemption now?

Mr. MARTIN. Not of cotton mills now.

The CHAIRMAN. Is there for electric plants?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. The same as before?

Mr. MARTIN. For 10 years.

Senator CARAWAY. That is merely to the company that furnishes the power?

Mr. MARTIN. Merely exempts the plants, including machinery and equipment necessary for the production, transformation, and distribution of hydroelectric power.

Senator CARAWAY. For furnishing power?

Mr. MARTIN. Yes, sir.

Senator CARAWAY. Not to the industries to which the power is supplied?

Mr. MARTIN. No, sir.

Senator CARAWAY. So that if he built a factory there—

The CHAIRMAN. He would have to pay taxes the same as anybody else, right from the beginning.

¹ Municipally owned.

STATEMENT OF MR. A. B. ALDRIDGE, BIRMINGHAM, ALA.

The CHAIRMAN. Give your name.

Mr. ALDRIDGE. A. B. Aldridge, Birmingham, Ala.

The CHAIRMAN. What is your business, Mr. Aldridge?

Mr. ALDRIDGE. I am in the coal business. I mine approximately 2,000 tons of coal a day.

The CHAIRMAN. You are a coal miner?

Mr. ALDRIDGE. Yes, sir; a coal miner.

The CHAIRMAN. Are your coal mines located near Birmingham?

Mr. ALDRIDGE. Yes, sir; within about 5 miles of the Gorgas plant.

The CHAIRMAN. Farther up the river?

Mr. ALDRIDGE. No, sir. We are due north of the Gorgas plant.

The CHAIRMAN. You are not on the river?

Mr. ALDRIDGE. Not exactly on the river.

The CHAIRMAN. What is your nearest town?

Mr. ALDRIDGE. Jasper. Our shipping point is Parrish, Ala.

The CHAIRMAN. Jasper is in the same county that the Gorgas plant is located in?

Mr. ALDRIDGE. Yes, sir.

The CHAIRMAN. Is it the county seat?

Mr. ALDRIDGE. Of the county of Walker.

The CHAIRMAN. Are you a stockholder in the Alabama Power Co.?

Mr. ALDRIDGE. No, sir.

The CHAIRMAN. Have you any interest in it?

Mr. ALDRIDGE. My wife has 10 shares, \$1,000, invested in it as a savings account.

The CHAIRMAN. Have you any other interest?

Mr. ALDRIDGE. No, sir.

The CHAIRMAN. Have you a contract with them for power?

Mr. ALDRIDGE. Yes, sir.

The CHAIRMAN. Do they supply you with power?

Mr. ALDRIDGE. Yes, sir. That is what aroused my interest and caused me to come to Washington.

The CHAIRMAN. Now go ahead in your own way and tell us what you wish to.

Mr. ALDRIDGE. Senator Heflin, when the committee came to Gorgas, I having known him practically all my life, met him down there with the idea that I would form some idea as to what a man in my position could expect as the outcome of this thing. My mines are located, as I told you a while ago, approximately 5 miles from Gorgas, and are solely dependent, along with 57 others, on the operation of this plant during the dry season.

Senator McKINLEY. For power, you mean? Dependent for power?

Mr. ALDRIDGE. For power, yes, sir.

The CHAIRMAN. How much power do you take, or how much does it take to operate your mines?

Mr. ALDRIDGE. It is taking now about 650 kilowatts at one mine and approximately 1,250 kilowatts.

Mr. MARTIN. About 1,800 horsepower.

The CHAIRMAN. How long have you been getting that power?

Mr. ALDRIDGE. This is the fourth year.

The CHAIRMAN. What does the contract provide as to the length of time? How long are you entitled to get it under your contract?

Mr. ALDRIDGE. As long as required. As I understand the situation, they can not refuse to give me power.

The CHAIRMAN. You have a contract with them, haven't you?

Mr. ALDRIDGE. Yes, sir.

The CHAIRMAN. Have you examined that contract to see just what it provides?

Mr. MARTIN. I think that is 10 years with your company.

Mr. ALDRIDGE. Ten years at the time I made it.

Senator CARAWAY. You ran your mines before you got this power?

Mr. ALDRIDGE. Yes, sir. I had my own power plant at that time.

Senator CARAWAY. I inferred from your statement that if this was cut off you would have to close your mine?

Mr. ALDRIDGE. Yes, sir.

Senator CARAWAY. You could not run them now?

Mr. ALDRIDGE. I could after going to the expense of building my power plant.

Mr. MARTIN. How much money did you invest in electrifying your mine, Mr. Aldridge?

Mr. ALDRIDGE. About \$65,000 at the old place and I forget just what the investment was at the other.

Mr. MARTIN. In the matter of electrifying the mines, what amount would you say these mining companies have approximately invested in electrification?

Mr. ALDRIDGE. I think I got it cheap, because I have had—

Mr. MARTIN. Just express it in round figures, as near as you can.

Mr. ALDRIDGE. I guess the average would be a good deal more than I paid. Around \$115,000 to \$125,000 at some of the mines.

Senator CARAWAY. Didn't you have yours electrified before you got this contract?

Mr. ALDRIDGE. No, sir.

Senator CARAWAY. I thought you were using electricity then.

Mr. ALDRIDGE. No, sir.

Mr. MARTIN. Will you explain to the committee why you use electricity, and the advantages of it, in mining operations?

Mr. ALDRIDGE. I installed it because I found by the use of hydroelectric power I could save approximately 10 cents per ton on the cost of my coal on the cars.

Senator CARAWAY. The Gorgas plant is not a hydroelectric power plant is it? Is it not a steam plant?

Mr. ALDRIDGE. Yes, sir; it is a steam plant.

Senator CARAWAY. You used the word "hydroelectric." You are not getting any hydroelectric power, are you?

Mr. ALDRIDGE. Yes, sir; during about eight months of the year.

Senator CARAWAY. You get that from the river?

Mr. ALDRIDGE. Yes, sir.

The CHAIRMAN. Is that gotten from the Alabama Power Co. also?

Mr. ALDRIDGE. Yes, sir.

The CHAIRMAN. You get all your power from that company, do you?

Mr. ALDRIDGE. Yes, sir.

The CHAIRMAN. Part of the year it is hydroelectric power, and part of the time it is created at Gorgas from coal?

Mr. ALDRIDGE. Yes, sir.

Mr. MARTIN. What percentage of the coal in Alabama is mined by companies whose mines are electrified, Mr. Aldridge?

Mr. ALDRIDGE. Approximately 51 per cent of the total production from Alabama is mined from mines which are served by the Alabama Power Co.

Mr. MARTIN. How much is the annual output of coal?

Mr. ALDRIDGE. Approximately 16,000,000 tons, and the mines which are electrified I believe show 8,414,179. That is the exact figure.

Senator CARAWAY. May I ask a question right there? Can you mine it cheaper where you have this hydroelectric power?

Mr. ALDRIDGE. Yes, sir.

Senator CARAWAY. Does it sell for the same all over the State? Every mine sells it at the same price?

Mr. ALDRIDGE. No, sir; every mine does not sell at the same price.

Senator CARAWAY. Do you sell cheaper than the other mines because you get your power cheaper?

Mr. ALDRIDGE. Different kinds of coal take different prices.

Senator CARAWAY. I know that, but are you selling this coal cheaper by reason of the fact that you are getting cheaper power?

Mr. ALDRIDGE. I am able to; yes, sir.

Senator CARAWAY. Do you do it?

Mr. ALDRIDGE. In a great many instances I sell it for less than what you would call a reasonable profit. To be frank with you, I have shown a profit of 7 cents a ton.

Senator CARAWAY. I am trying to find out whether the people get the advantage of this cheaper power you get, or whether you get the same price for your coal when you say it costs you less to mine it.

Mr. ALDRIDGE. Competition creates that very difference itself.

Senator CARAWAY. The mine that is not electrified can not sell at all, then, can it, if it costs him more to mine? You come here to convince Congress that it ought to let the people enjoy this cheaper power, because you can mine coal cheaper, and I want to know, then, whether you give it to the public or take it as private profit?

Mr. ALDRIDGE. I can explain in this way, if you will allow me to.

Senator CARAWAY. Yes, sir.

Mr. ALDRIDGE. We found that during the past 12 to 15 months, when the coal market has been simply covered up with coal, there has been more coal than any of us could sell, that the mines that are electrified have operated, because they could operate cheaper and sell their coal cheaper, and those that were not electrified, as a

rule, when the coal market is very dull and coal on hand to sell, the low price of electricity enables us to keep the mines in regular operation and permit our employees to earn wages instead of shutting down the mines and throwing them out of work.

Senator CARAWAY. When there is a market do you all sell at about the same price?

Mr. ALDRIDGE. Practically, the different grades.

Senator CARAWAY. So the profit stays with the man who gets the cheaper power. I just wanted to know, because the public has some interest in what we are going to do.

Mr. ALDRIDGE. Yes, sir.

Mr. MARTIN. Explain as to the advantages of the electrification of a mine, as briefly as you can, Mr. Aldridge, and as quickly as you can.

Mr. ALDRIDGE. Well, to start with, I have no doubt the Senate is interested in living conditions. Prior to the coming into Alabama of hydroelectric power our mine camps were at night as dismal places as any man ever went into. There was nothing there but an ordinary oil light. There were no conveniences. To-day you go into a mine camp—and I would be glad to take this committee into mine—and you can find the lady there with a washing machine being operated by electricity. You can go in on the breakfast table and find them cooking their toast like Senator Heflin has his. You will find their houses lighted up, and playgrounds. You will find running water in practically every house, made possible because we can convey this power to different points where we can get good water supply.

In other words, you will find the miner, instead of living in a dark hovel, as they did when I first went into the mines 20 years ago, you will find him living there with his lights shining and happy.

Mr. MARTIN. What about the effect on labor and the dangers in mine operations?

Mr. ALDRIDGE. We find that the casualties in Alabama have been reduced—I forget just what the percentage is, but it is enormous.

The CHAIRMAN. That would not all be on account of electricity?

Mr. ALDRIDGE. Not altogether; no, sir.

The CHAIRMAN. You have made other improvements in other lines? This is only one of them?

Mr. ALDRIDGE. That is what I want to call your attention to. In mining coal with electric mining machinery, it so fixes the coal that we don't have to put a heavy charge of powder in it. Ninety-five per cent of the explosions in Alabama have been caused by heavy charges of powder being placed back down in the faces of the coal in order to break it down, as we call it, from the solid, and instead of that powder taking effect in the coal and pulling it, to use the miner's expression, it blows it and makes what we call a windy shot, first igniting the gas, and then a dust explosion, and no doubt your records will show that we have killed as many as 112 by the old method, I believe, at one time. That is what causes it. With the use of electric mining machinery it is not necessary to use strong explosives. We simply used a little powder, and that does away with the opportunity of creating a dust explosion. It also leaves our props in better shape, because with the heavy shot we always blow down our props, and with a light shot we always leave them in position, and our men can go back and go to work in safety. I have had one man killed in four years, mining around 300,000 tons of coal a year.

Mr. MARTIN. If you did continue to use electric power, is it possible for a mine to set up its own generating plant?

Mr. ALDRIDGE. It is possible.

Mr. MARTIN. But as a matter of cost it is prohibitive?

Mr. ALDRIDGE. It just raises your cost about 10 to 12 cents a ton, which is, in a great many instances, more than our margin of profit.

Mr. MARTIN. You would have to go to some other source of power, then, such as gasoline or steam, in case your present source of power is discontinued?

Mr. ALDRIDGE. Yes, sir. Now, some weeks ago, I had a good many of my friends who live out in Walker County come to me and ask me what was going to be the outcome of this Gorgas situation. Their reason for coming to me was that I am a member of the board of governors of the Alabama Mining Institute. They wanted to find out where they would stand if Gorgas was taken away from the Alabama Power Co. After thinking that matter over I wrote Mr. Hoover a letter, and I have his acknowledgement of the receipt of that letter. He said he would refer it to Secretary Weeks, but we got no definite information from Mr. Hoover as to what we could expect.

Mr. MARTIN. Would you like to read that into the record?

Mr. ALDRIDGE. If you would allow me to.

The CHAIRMAN. All right.

Mr. ALDRIDGE. I first wired Mr. Hoover, then wrote him this letter:

STITH COAL CO.,
BROWN-MARX BUILDING,
Birmingham, Ala., June 2, 1922.

HON. HERBERT HOOVER,
Secretary of Commerce, Washington, D. C.

SIR: Referring to my wire to you of June 1, 1922, copy of which is attached hereto, I beg to supplement the same by this letter and inclosure.

As you are probably already informed, the coal mines producing over 50 per cent of the coal mined in this State use in their operations the electric service of the Alabama Power Co. The power served by the Alabama Power Co. to these mines is produced at Lock 12 on the Coosa River and at the so-called Gorgas steam plant on the Warrior River in Walker County. The Gorgas steam plant is an auxiliary plant used to supply electric current during the dry seasons of each year, lasting from late June until early October, when the flow of the Coosa River at Lock 12 is not sufficient to meet the demands of the power company. Attached hereto for your information in this connection is a list of the mines served by the Alabama Power Co.

As you are also informed, the strike conditions prevailing in Pennsylvania, Ohio, Kentucky, and other regions are not prevalent in this State, but in order that the coal production of this State be utilized to its fullest capacity in relieving the scarcity of coal which faces the entire country during the months of July, August, and September, it is necessary that the service of the Alabama Power Co. to the mines named on the list herein inclosed be maintained.

Under its contract with the United States Government relative to the Government extension of the above mentioned steam plant at Gorgas on the Warrior River, the Alabama Power Co. is supplying by means of such extension electric service to these mines. It has been noted that the House Military Affairs Committee in making a suggested change to Henry Ford in his offer for the Muscle Shoals properties advised Mr. Ford that the Gorgas steam plant should not be included in the negotiations for such properties, but that Mr. Ford refused to make his offer conform to this suggestion of the committee. This position of the Military Affairs Committee is entirely justified in connection with the facts in regard to the contract between the Alabama Power Co. and the Government, and any other decision tending to disrupt the service of the power company from that plant would cause the cessation of operations during a great part of the months of June, July, August, and September at the mines shown on the within inclosure.

Regardless of any contention between the Alabama Power Co. and Henry Ford, and without taking either side, I feel that the industrial situation in the mineral region of this State demands that the Gorgas steam plant as an entirety be allowed to remain in the service in which it is now engaged and trust that you and your department will investigate the matters herein mentioned very fully, and if necessary communicate the same to the House Military Affairs Committee and the Senate Agricultural Committee, which are now considering the offers of Alabama Power Co. and Henry Ford for the Muscle Shoals properties.

The interests of the coal operators and miners and the public to which they owe their duty of full production should be considered in the matter of the disposal of the Government's interest in the Gorgas steam plant. The present situation in which it is threatened to turn the same over to Henry Ford places them in the position of the innocent bystander of the shooting affray between the power company and Ford, which, however blameless on their part, is nevertheless very uncomfortable, I assure you, and fraught with danger to the interests of the public with which your department is concerned.

If there is any further information which your department desires, either by correspondence or by demanding my presence in Washington, I will be glad to comply with your wishes at my expense.

I am sir, respectfully yours,

A. B. ALDRIDGE.

The CHAIRMAN. For the purpose only of shortening the hearing, while I have no objection to letters like that being read, it extends the hearings to such an extent, I think the fact that such a letter was written, or something of that kind, could be mentioned without reading it all into the record.

Mr. MARTIN. The Secretary acknowledged receipt of that letter?

Mr. ALDRIDGE. Yes, sir.

Mr. MARTIN. That is all from this witness, Mr. Chairman.

The CHAIRMAN. Are there any questions by any members of the committee? If not, we will hear the next witness.

STATEMENT OF MR. FRANK NELSON, JR., BIRMINGHAM, ALA.

Mr. MARTIN. State your business, Mr. Nelson.

Mr. NELSON. I am a coal operator in Birmingham. Well, I have a good many interests there, but my principal business is in coal. I am also a member of the Manufacturers' Association in Alabama.

Our Mr. Sevier, president of the Manufacturers' Association of Alabama, wanted to come to Washington to attend this hearing, and wrote me a letter giving his views, and asked me to be kind enough to represent the association and present them with this short letter embodying his views, which are the views of the members of the Alabama Manufacturers' Association.

I will present the letter, with your permission.

The CHAIRMAN. All right. It will be put in the record.

Mr. MARTIN. I will say that that letter is of such a character that I would like to have you examine it and see if you will put it in the record.

The CHAIRMAN. It will be printed in the record.

Mr. NELSON. The letter is short.

The CHAIRMAN. If it is short, you can read it if you want to.

(Mr. Nelson thereupon read the letter referred to, as follows:)

ALABAMA MANUFACTURERS' ASSOCIATION,
Birmingham, Ala., June 19, 1922.

Mr. FRANK NELSON, JR., *City.*

DEAR SIR: In connection with the hearings now pending before the Senate Forestry and Agricultural Committee at Washington (which hearing I understand you will attend, and which I would kindly ask you to represent the Alabama Manufacturers' Association) concerning the disposal of Muscle Shoals property to Mr. Henry Ford under his offer, it is our desire that certain information with reference to the Gorgas steam plant situated on the Warrior River in Walker County, Ala., be brought to the attention of the committee as affecting the members of this association and their industries, the said association's membership having more than 125 different classified manufacturing interests distributed through 42 counties of the State, the greater number of which are in the territory served by the Alabama Power Co., the said interests having more than \$300,000,000 invested in their plants, employing approximately 125,000 people, and under normal conditions a pay roll of \$75,000,000 annually. Many of our members are coal operators, more than 50 per cent of which are users of the Alabama Power Co.'s power.

As you are informed, during the low-water season on the Coosa River, generally lasting the greater part of the months of July, August, September, and October, approximately 57 per cent of the electrical load of the Alabama Power Co. is carried by the Gorgas Steam Plant when the flow of the Coosa River at Lock 12, its hydro-electric plant, is not sufficient to meet the power demands of that company.

The Gorgas Steam Plant, so I am informed, supplies this power by means of the joint operation of two steam turbines, one of which was erected under contract between the United States Government and the Alabama Power Co. giving the right to the power company to operate the same for its own use upon paying certain rental and other conditions. This association has been authoritatively informed that any disposal of the Gorgas Steam Plant abrogating the terms of the contract between the power company and the Government will result during the dry season of each year as mentioned above, if not in cessation, at least in the most serious curtailment of the electrical service of the power company upon which a great number of the industries represented by this association are dependent for their operation.

As you are also informed, during the past several years in which the industries represented by this association have begun to use the electric power service of the Alabama Power Co., a great number of them, including coal mines, cement plants, cotton mills, and other industries, have dismantled their power plants, relying upon the service of the power company as a public utility for the supply of their electrical needs.

It is not the desire of this association to indorse or condemn any of the offers now pending concerning the disposal of the Muscle Shoals properties, but it is desired to call to the attention of the governmental authorities who are to pass upon this question the fact that other parties than Mr. Ford and the power company are interested in the disposal of the Government's interest in the Gorgas steam plant, and that the industrial situation in Alabama will be seriously and irremediably affected by the removal of that plant from the service in which it is now engaged. For that purpose it is requested that you appear before the Committee on Forestry and Agriculture of the United States Senate as a representative of this association and present to them the

relation of the electric power system of the Alabama Power Co., and particularly the Gorgas plant, to the manufacturing, mining, and other industries of this association, amplifying the facts herein set forth by such data and statements as your broad knowledge of the industrial situation here dictates.

Yours very truly,

L. SEVIER, *President.*

Mr. MARTIN. Will you just make a statement in your own way, please?

Mr. NELSON. Mr. Chairman, I have been in the coal business and other lines in Alabama for several years, not quite as extensively in the coal business now as I have been, having sold three of my operations, but I still have two that were formerly supplied with steam produced by a power plant of my own. About four years ago I made a contract with the Alabama Power Co.—my recollection is for some 10 years—and I dismantled and sold off my plants. I do not mean to say that I would be compelled to shut down my mines a part of the year if the Gorgas plant is taken away from the power company, but I could not operate during the low-water season until I rebuilt my power plant at great expense, which I would not, of course, like to do. I do not understand and have never understood, the complicated situation with reference to the Gorgas plant. I have had—as I have stated—a great deal of experience in the coal business and in other lines in Alabama, and with the situation as I see it and a larger power plant at Sheffield I just can not conceive of the necessity of the Gorgas plant in connection with the other proposition at Muscle Shoals.

The lowest freight rate on coal delivered to the river is 87½ cents, and you can't get it on the river without opening a coal mine, and that takes something like the same length of time it takes to build a power plant. I was unfortunate enough to go on a bond to build a couple of locks on this same river, lower down, and I know something about the cost of getting coal to the river, putting it in barges, barging it down the river, taking it out again and delivering it to a steam plant, and it seems to me if Mr. Ford wants power he can get coal delivered at the Sheffield power plant just about as cheap as he can at the Gorgas plant, unless he acquired the coal at Gorgas owned by the Alabama Power Co. I have no objection to Mr. Ford getting the Muscle Shoals proposition and am not here fighting Mr. Ford, but I simply mean to state that it is not essential for Mr. Ford to own part or all of the Gorgas plant, even for temporary power.

Mr. MARTIN. Unless he should acquire the coal mines immediately at the plant, then he would be under the necessity of bringing coal to the plant from other localities?

Mr. NELSON. Now, Mr. Martin, you can make your own figures. The lowest rate he can get coal to the river for is 87½ cents. You have got to get the coal to it in the river, in the barges, barge it down to Gorgas and unload it and get it to this plant, as the Gorgas plant is not located on any railroad. The rate to Sheffield, I believe, is \$1.60 or \$1.70 per ton. It looks to me like he can get the coal to the power plant at Sheffield, a plant that is already built, and very much larger and finer than the one at Gorgas, quite as cheaply as he could get it to the Gorgas plant, assuming that he did not own or control the coal mine at Gorgas belonging to the Alabama Power Co. If this were done it would save all the darned complications touching the Gorgas plant.

The CHAIRMAN. He expects to use the coal that is mined at the Gorgas plant right there.

Mr. NELSON. I know, but he doesn't own it.

The CHAIRMAN. I know he doesn't own it, but I presume he expects to buy it from the Alabama Power Co. He could buy from them cheaper than he could buy from somebody else and ship it in there.

Mr. NELSON. I don't know, of course.

Mr. MARTIN. Assuming that the Alabama Power Co. would desire to sell it.

Is not this true, Mr. Nelson, that there are a number of favorable locations on the Warrior River near undeveloped coal where a steam plant could be located?

Mr. NELSON. Dozens of them.

Mr. MARTIN. So that if he would locate a steam plant at some other locality on the Warrior River he could obtain whatever advantages there are at the Gorgas location?

Mr. NELSON. I don't see why he couldn't.

Mr. MARTIN. Will you go forward into your ideas as to the effect upon industry in general of being deprived of electric power, Mr. Nelson?

Mr. NELSON. It seems to me, Mr. Martin, before an intelligent committee like this that is altogether unnecessary. If you cut off for a part of the year practically one-half of the power furnished by the Alabama Power Co. that a large number of textile mills, cement mills, and coal mines use, it ought to be apparent to everybody just what effect it would have. Whether or not Mr. Ford, if he takes your place and gets this property, will supply this power to these coal mines and textile mills and cement

plants, I don't know, but if he did not do so the condition would simply be deplorable, because, as I said, in both my coal mines I have dismantled my power plants.

The CHAIRMAN. Take your case, now. Suppose the Government takes this plant away from the Alabama Power Co. and gives it to Mr. Ford, and then he uses the power himself and does not let you have any of it, and the result would be that your contract was violated; you would have an action for damages, of course, wouldn't you?

Mr. NELSON. Well, I am not a lawyer.

The CHAIRMAN. If they do not supply you with electricity you could sue the Alabama Power Co., and they in turn the Government who took the plant away from them, and get your money back, couldn't you?

Mr. NELSON. I would think so.

The CHAIRMAN. It would seem that if your contract was violated by the other parties they ought to pay you whatever your damages would be.

Mr. NELSON. I think probably that is true.

Mr. MARTIN. On the other hand, even assuming—

Mr. NELSON. But, gentlemen, I don't want to get into a lawsuit if I can help it.

Mr. MARTIN. Even assuming that you could be reimbursed some of your damage that you might sustain, is it not true, Mr. Nelson, that, if your coal mine can not supply your coal that you may be under contract to deliver, that interferes with your business?

The CHAIRMAN. That would be one of the elements of damage. The Government, if it was the cause of your violating all your contracts, would have to pay you your damages.

Mr. NELSON. You can imagine what a complication I would have with two coal mines closed for want of power, with contracts for the sale of coal to a great number of people. I would probably have people bringing suits against me for a breach of my contracts, and I would be suing the Alabama Power Co. and the Alabama Power Co. suing the Government.

The CHAIRMAN. That would make a good lively business for the lawyers.

Mr. NELSON. I went on a bond with the Government for \$200,000, to build a couple of locks on the Warrior River, and finally they took one of them over for completion. I employed a number of lawyers down that way and some up here, and it took me about four years, and I never got started in the matter of adjusting the damages claimed, and I finally paid it.

Mr. MARTIN. What was your loss?

Mr. NELSON. About \$135,000. There were two of us. Another party, one-half.

Mr. MARTIN. Now, Mr. Nelson, I just want to read—of the 16,000,000 tons of coal mined in Alabama, is this approximately correct as a distribution?

Mr. NELSON. Yes; that is the best of my information.

Mr. MARTIN. Of that amount there is about 5,000,000 tons that is consumed by the railroads?

Mr. NELSON. Yes.

Mr. MARTIN. About 5,000,000 tons consumed in the iron furnaces?

Mr. NELSON. Yes.

Mr. MARTIN. About 1,000,000 tons consumed for household purposes?

Mr. NELSON. And domestic coal.

Mr. MARTIN. And domestic coal, 5,000,000 tons, and for isolated electric plant water-pumping and similar operations, of which total of 16,000,000 tons approximately 8,500,000 tons are mined with power furnished by Alabama Power Co. from this source. Now, is it not also true that any interference with this continued supply of coal for these various public purposes would affect other industrial plants, the railroad transportation, and other public-utility uses?

Mr. NELSON. I don't see why it shouldn't Mr. Martin, if you shut off practically half of your power. You take the city of Birmingham. It gets all of its power for lighting and running its street cars from the Alabama Power Co., and the Birmingham Railway, Light & Power Co., supplying the city of Birmingham and operating the street car lines, supply a great number of manufacturing plants in and around Birmingham that are not direct customers of yours but are indirect customers.

The CHAIRMAN. Does the city of Birmingham get its light for its streets and for its residences from the Alabama Power Co.?

Mr. NELSON. Every bit of it.

The CHAIRMAN. If that were shut off and given to Mr. Ford and the city went in darkness for a while with the idea that the Government would pay you your damages, you would not care much, would you? Wouldn't you like to help out that much on Mr. Ford's philanthropic ideas?

Mr. NELSON. Well, not to-day.

The CHAIRMAN. You had better consider that seriously.

Mr. NELSON. Gentlemen, it is just beyond my conception, with the tremendous big power plant at Sheffield that cost the Government \$15,000,000, and being able to deliver coal there under the circumstances, just as cheap as you could deliver it at the Gorgas plant, why is it necessary to muddy up the waters down at the Gorgas plant? I am not against Mr. Ford getting Muscle Shoals. If he built up a big town there, as big as New York, it would benefit me.

The CHAIRMAN. It would be bigger than New York.

Mr. NELSON. I am a citizen of Birmingham, and anything that helps Birmingham helps me. I am interested in anything that Mr. Ford wants to do that will help our section, and I am not here to fight Mr. Ford, but this thing of taking the Gorgas plant and giving it to Mr. Ford is so preposterous that I see no use in the world to disturb something that should not be disturbed, but the negotiations should be confined to Muscle Shoals by Mr. Ford or anybody else. Now, I don't pretend to tell this committee whether they should let Mr. Ford or some one else have Muscle Shoals. You have information about various phases of the situation that I do not possess.

Senator HEFLIN. Mr. Nelson, you feel that you and other coal operators down there who are now being supplied with electric power from the Gorgas plant are entitled to have that power continued?

Mr. NELSON. Oh, I don't think there is any question about that, Senator.

Senator HEFLIN. That is the primary interest that you have in it?

Mr. NELSON. That is all the interest I am here to represent, and I think it is the duty of this committee, the Senate and the House to see that we get it. You can let Mr. Ford have Muscle Shoals, if you see proper.

Senator HEFLIN. If Ford gets Muscle Shoals and the coal operators can still get their electricity you would have a happy settlement of the situation?

Mr. NELSON. I hope so.

The CHAIRMAN. Remember, Mr. Nelson, that that answer to that question will be used, perhaps, later in a statement that you had advocated the giving of Muscle Shoals to Mr. Ford.

Mr. NELSON. Well, I don't want to make that statement, I am not at all conversant with all the facts touching Mr. Ford's offer for this Muscle Shoals proposition.

Senator McKINLEY. The next thing that will be used will be the fact that Ford can sell you the power from Gorgas.

The CHAIRMAN. What rate do the people of Birmingham pay for electricity? I mean the ordinary householder, now. How much does he have to pay?

Mr. NELSON. Mr. Martin is more familiar with that than I.

The CHAIRMAN. You live there?

Mr. NELSON. Yes.

The CHAIRMAN. Do you know what you pay for your household electricity?

Mr. NELSON. No; I don't. The details I don't know.

The CHAIRMAN. Can you give that, Mr. Martin?

Mr. MARTIN. Yes, sir. It is 8½ cents per kilowatt hour, less 10 per cent discount for prompt payment.

The CHAIRMAN. Does that decrease as the volume increases?

Mr. MARTIN. Oh, of course. That is the highest rate. It decreases with the use.

Senator McKINLEY. You pay 10 cents in Washington.

The CHAIRMAN. You get it for 19 mills cheaper than we get it in Washington?

Senator McKINLEY. Twenty mills. You pay 100 mills per kilowatt, and they pay 80 mills per kilowatt, or 81.

The CHAIRMAN. You get it 2 cents per kilowatt hour cheaper?

Senator McKINLEY. Yes. Then it grades down.

The CHAIRMAN. I was trying to find out what the ordinary person in the home would have to pay for electricity.

Mr. MARTIN. About 6 cents.

The CHAIRMAN. How much did you pay before you bought the electricity of the Alabama Power Co.?

Mr. NELSON. I used steam. I had a steam power plant.

The CHAIRMAN. I mean the citizens of Birmingham.

Mr. NELSON. I don't know.

Mr. MARTIN. In the first place, it has been reduced a cent and a half, as I recollect, per kilowatt hour since we came into Birmingham.

The CHAIRMAN. How did they get their electricity before you went in there?

Mr. MARTIN. By operating a big steam plant in the city of Birmingham.

Senator McKINLEY. As a public utility, regardless of whether you want to make a contract or not, are you not required, under reasonable conditions, to furnish service to anyone that wants it?

Mr. MARTIN. Yes; Senator. That is always a condition of the public utility act—that we must always hold ourselves in readiness to supply service. That is a part of the franchise under which we have developed electric power and under which we transmit power over the highways and exercise powers of eminent domain, and exercise franchises in general. The public service commission has jurisdiction to entertain a petition to require us to serve the public. Of this greatly increased amount of power that we must serve this year and next, I have not the slightest doubt that in two-thirds of the cases I mentioned this morning that want power, there is jurisdiction in the commission to require us to extend the service, and failure to extend the service subjects us not only to penalties, but to a possible forfeiture of our right to do business in the State.

Senator McKINLEY. As I understand it, you have now practically 160,000 horsepower, and application for about 80,000 more?

Mr. MARTIN. Yes, sir; we have a connected load of 400,000 horsepower, and the peak is about 160,000. That is rather confusing evidence.

Senator McKINLEY. You have a connected load of 400,000 horsepower?

Mr. MARTIN. Yes, sir. I testified when I was here before that our connected load was 370,000 last December. We have increased it 30,000 since December, and the load is going up every day.

The CHAIRMAN. What do you mean by connected load as distinguished from the power that you are delivering to somebody?

Mr. McKINLEY. Describe it right in this room. You can do it right here. Here is a connected load, if we were to run all these lights. As a matter of fact, we run about one-fifth of them, but the connected load would be these two fans running and all the lights running. As a matter of fact, they are not running, but that would be the connected load. Is that right?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Do you mean that you own 400,000 horsepower?

Mr. MARTIN. No, sir.

The CHAIRMAN. I didn't think you did.

Mr. MARTIN. No, sir. It means that the coal mines, cement mills, cotton mills, and various industries have motors which, combined, total approximately 400,000 horsepower, which would be the demand on us if all were operating at one time.

The CHAIRMAN. If they all operated at one time you could not supply them, could you?

Mr. MARTIN. No, sir.

The CHAIRMAN. It would be like a bank. If all their depositors wanted their money at once they could not pay them.

Mr. MARTIN. In practice, Senator, we know that the load is going to run within certain limits.

The CHAIRMAN. Yes. You can not supply anything more than you actually have harnessed up.

Mr. MARTIN. That is correct; and there is a diversity factor in all lines of business, and that is the safety of this business—the diversity. We are able to connect up 400,000 load because we know that the demand on us at any one time will be approximately the same amount, and we supply the equipment to meet that demand, which, in the business, as Senator McKinley knows, we can forecast and keep up with. In other words, next year we know this connected load will be 500,000 horsepower.

The CHAIRMAN. For instance, the power you use in your cement mill which runs in the day time, won't be needed at night?

Mr. MARTIN. They run pretty nearly all the time.

Senator McKINLEY. That is a different proposition. They are pretty near 100 per cent.

Mr. MARTIN. Yes, sir.

The CHAIRMAN. In a city like Birmingham the amount of electricity you supply during any 24 hours varies very greatly, does it not?

Mr. MARTIN. Yes, sir; from 35,000 to 40,000 horsepower of peak load in the day down to probably 8,000 horsepower at night.

Senator McKINLEY. Here is another thing, Mr. Chairman. For instance, they are charging the lease consumer 81 mills. They would get some consumer like a great big power user and he would agree not to use any power during the peak load, and they make him a rate, maybe, of a fourth of that.

The CHAIRMAN. Yes.

Mr. MARTIN. I would just like to state, Senator, on the subject of rates, in 1921 our company received approximately 7½ mills per kilowatt hour for the power we sold. That gives you the great variety of industrial load and lighting load of 7½ mills as against a comparable figure in Ontario of 9.25 mills.

STATEMENT OF MR. WILEY ALFORD, ATTALLA, ALA.

Mr. MARTIN. Mr. Alford, you reside at Attalla, Ala.?

Mr. ALFORD. Yes, sir.

Mr. MARTIN. What is your business?

Mr. ALFORD. Manufacturing plumbers' and steam fitters' supplies.

Mr. MARTIN. What is the name of your firm?

Mr. ALFORD. The National Pipe & Foundry Co.

Mr. MARTIN. How long have you been operating that company?

Mr. ALFORD. Since early 1916.

Mr. MARTIN. And you have a power contract with the Alabama Power Co.?

Mr. ALFORD. Yes, sir.

Mr. MARTIN. Now, Mr. Alford, your plant is electrified, is it?

Mr. ALFORD. Yes, sir.

Mr. MARTIN. And that is your only source of power?

Mr. ALFORD. Yes, sir; it is.

Mr. MARTIN. Will you just explain to these gentlemen what the result would be on your business if your source of power supply was interrupted wholly or for several months in the year?

Mr. ALFORD. If power was interrupted for one hour during any part of the year it would mean that our plant would have to close down completely. We have no other source of supply. The plant is driven by some 38 motors, ranging in size from one-half to 75 horsepower. If the plant were closed down, it would throw between 250 and 300 men out of work. These men are largely specialists in their line, and they would not drift into other industries, but would probably have to leave the State in order to find work during those periods of from three to four months each year.

Our product goes to practically every State in the Union and to Cuba, Mexico, Central and South America, the Philippines, and China. Not more than 2½ per cent of our product is used in Alabama. We are at the present time manufacturing goods to be used in the construction of dwellings, apartment houses, office buildings, and factories in about a dozen different States. We are also manufacturing another line of goods which is being used in the construction of steam plants for the supply of electric energy to public utility operations, and for oil companies operating in Louisiana, Texas, Oklahoma, and Tampico, Mexico. Fully 95 per cent of our costs is composed of expenditures made for raw materials and supplies produced in Alabama, and for labor. It can be seen very readily how far-reaching the effect would be if the operation of our plant were interrupted.

The condition which would be brought about with our company is not very different from the condition which would obtain with practically all of the industries in the State which the Alabama Power Co. serves. There would be a period of from three to sometimes five months during which those industries would have to close down, practically entirely, leaving a large part, possibly 75 per cent, of our factory operatives out of work. This, of course, would work a hardship on these people, would deprive them of their earning capacity, and would affect the farmers materially as it would curtail their market for their products. If the power were suspended from three to five months during the year we, of course, would figure on another source of supply, which would mean the installation of boilers and engines, thereby increasing our cost possibly threefold for that item alone.

The CHAIRMAN. How long have you been taking power from the Alabama Power Co.?

Mr. ALFORD. Since 1916.

The CHAIRMAN. Where did you get your power before that?

Mr. ALFORD. The plant was built in 1916.

The CHAIRMAN. You started right in with that?

Mr. ALFORD. Yes, sir.

The CHAIRMAN. You have never had any other source of supply?

Mr. ALFORD. No, sir.

The CHAIRMAN. How much power do you use?

Mr. ALFORD. In terms of horsepower or connected load?

The CHAIRMAN. Horsepower?

Mr. ALFORD. I think we use around 175 horsepower.

The CHAIRMAN. What is the value of your output per year?

Mr. ALFORD. I would put it at present as going about \$720,000 a year.

The CHAIRMAN. How many employees do you have?

Mr. ALFORD. Between 250 and 300.

The CHAIRMAN. How much money is invested in your business?

Mr. ALFORD. About \$250,000 in plant, in addition to working capital.

The CHAIRMAN. How long a term is involved in your contract for power with the Alabama Power Co.?

Mr. ALFORD. I am not sure. I think it is 10 years. I think it has four more years to go.

The CHAIRMAN. Are you a stockholder in the Alabama Power Co.?

Mr. ALFORD. I have \$600 of their preferred stock acquired in the last two months.

The CHAIRMAN. Are any members of your family or business associates stockholders in it, any of your firm or corporation?

Mr. ALFORD. No member of my family. I am not sure about my business associates; but I think not.

The CHAIRMAN. You want us to understand, do you, that the only interest you have in it is that you do not want any action taken that would interfere with the supply of power or would interfere with your contract which you have made with the Alabama Power Co.

Mr. ALFORD. I am interested, of course, in my own contract with the Alabama Power Co.—that is, my company's contract—and in anything that affects the State generally because if it affects it adversely, it affects me. I have interests in other sections of the State besides in Attalla.

The CHAIRMAN. Have you any interest in what disposition is made of Muscle Shoals proper?

Mr. ALFORD. No financial interest. I have a personal interest.

The CHAIRMAN. How far are you located from Muscle Shoals?

Mr. ALFORD. Across the country. I believe it is around a hundred miles.

The CHAIRMAN. How far from Birmingham are you?

Mr. ALFORD. About 52 miles.

The CHAIRMAN. Which way from Birmingham?

Mr. ALFORD. I am northeast of Birmingham.

The CHAIRMAN. If the Gorgas plant was eliminated from the Muscle Shoals question, you would not be interested in what disposition was made of it by the Government, would you?

Mr. ALFORD. Yes, sir; I would.

The CHAIRMAN. You would?

Mr. ALFORD. Yes, sir.

The CHAIRMAN. What do you want the Government to do with it?

Mr. ALFORD. I prefer that it be owned by strictly a public-utility concern.

The CHAIRMAN. You are in favor of the bill, then, probably that I have introduced. Have you examined that?

Mr. ALFORD. I have not examined that.

The CHAIRMAN. I would be glad to have you examine it. Do you believe it ought to be developed in the interest of the entire public?

Mr. ALFORD. Yes, sir.

The CHAIRMAN. And not given away to anybody?

Mr. ALFORD. No, sir.

The CHAIRMAN. Have you any questions of this witness, Senator Heflin?

Senator HEFLIN. What do you think about Mr. Ford's suggestion of using it to manufacture fertilizer, cheap fertilizers to the farmer? Don't you think it could be used that way and benefit more people than probably in any other way?

Mr. ALFORD. No, sir; I don't.

Senator HEFLIN. You would not use it for manufacturing fertilizers?

Mr. ALFORD. I think it could be used in part for the manufacture of fertilizer.

Senator HEFLIN. You are certainly against Mr. Ford's offer, then, are you not?

Mr. ALFORD. As it is; yes, sir.

Senator HEFLIN. What objection have you got to his offer as to Muscle Shoals if Gorgas were not included?

Mr. ALFORD. My objection is that Mr. Ford proposes to use the power to be developed at Muscle Shoals to supply industries in that immediate locality. I prefer that this project be developed and owned by a public utility company in order that the South, particularly the Southeastern States, and more particularly the State of Alabama, may be enabled to use the power to develop industrially along diversified lines. This power will be badly needed in the immediate future to serve industries already established which are being enlarged, to supply industries which will be established, and those which will be moved to Alabama from other sections of the country in order to take full advantage of the State's natural resources of which hydro-electric power is a very attractive one.

Mr. MARTIN. There are thousands of people in Alabama that feel just as you do about it, are there not?

Mr. ALFORD. I think there is no question about that, and that impression is growing rapidly.

**STATEMENT OF MR. S. H. DENT, MONTGOMERY, ALA., ATTORNEY
FOR THE ALABAMA POWER CO.**

The CHAIRMAN. State your name and occupation.

Mr. DENT. S. H. Dent, Montgomery, Ala. I am attorney for the Alabama Power Co. in the matter of the Warrior steam plant contract.

Mr. Chairman, there has been so much publicity with reference to the Muscle Shoals development and Mr. Ford's offer with regard thereto that I hesitate to consume the time of the committee on this subject. I am going to state at the outset that I shall simply present a synopsis of the points which I think sustain the validity of the contract between the Government and the Alabama Power Co. with reference to the plant, without elaborating the argument, simply stating the points so as to save time and I hope not to consume more than a few moments of the committee's time in doing that.

In order to state as briefly as possible the terms of the contract in so far as this proposition is involved, negotiations were begun between the Government and the Alabama Power Co. in the latter part of November, 1917, which led to the execution of the contract in question practically a year later, about November 8 or 9, 1918. The power company was approached by the Government on this subject through its former president, Mr. James Mitchell, who is now dead. When the President of the United States decided to construct nitrate plants at Muscle Shoals for the purpose of producing explosives during the war, the Ordnance Department began to look about for electric energy to be used during the period of construction and early operation, and the nearest power that they could get was the steam plant of the Alabama Power Co., at Gorgas, 88 miles south of Muscle Shoals. It was learned that the original plant of the power company, which was constructed prior to the beginning of the war, was not sufficient to supply this power to the Government and also to take care of its customers, many of whom were engaged in war industries. The result was that the Ordnance Department entered into an understanding with the Alabama Power Co., which was verbal at that time, and for which there was no legal authority at that time, to extend or enlarge their plant, practically double it—I believe a little more than double it—the Government to furnish the money and the construction to be made under the direction of the Alabama Power Co., supervised, of course, by Army officers. It is, of course well known that at that time no one could get any large sum of money for any such construction work, except the Government. Now, to come down to the terms of the contract—

The CHAIRMAN. Before you go to that, under this verbal agreement they went ahead with construction?

Mr. DENT. The Alabama Power Co. went ahead—I should have said that—under this verbal agreement, and in compliance with orders issued by the Ordnance Department that company proceeded with the construction or enlarging of its plant and building a transmission line to Sheffield, Ala.

The CHAIRMAN. That is, Muscle Shoals?

Mr. DENT. Muscle Shoals, perhaps better understood.

The CHAIRMAN. Was that constructed before the written agreement was made?

Mr. DENT. The construction work, as I understand, was practically complete before the written contract was entered into.

The CHAIRMAN. Now, then, they made a written contract?

Mr. DENT. The written contract was made by the terms of which, in brief, the Government was to furnish the money to enlarge the plant and build the transmission lines, and the company was to furnish power for the construction and operation of nitrate plant No. 2 at a certain price.

The CHAIRMAN. I suppose that written contract was in reality carrying out the terms of the verbal contract that was made when the construction took place?

Mr. DENT. It was.

The CHAIRMAN. The written contract was simply putting in writing—

Mr. DENT. Putting in writing what had been understood between the power company and the Government in regard to the enlargement of this plant.

Under the terms of the contract the Government was authorized to retain a certain amount which it was required to pay for electric energy to the power company as what might be called a sinking fund for the purpose or repaying it for its investment in the enlargement of the power company's plant. The enlargement of the plant is connected directly with the original plant of the power company, and is upon the lands owned by it. The transmission line also is erected upon lands condemned or purchased by the Alabama Power Co. and which now belongs to that company, all of which was acquired prior to the act of April 11, 1918, authorizing the Government to acquire lands for munitions purposes.

It was provided in the contract that the title to the property paid for with the money of the Government of the United States should remain in the United States and be treated as personality.

Article 22 of the contract is the article providing for the sale of the enlarged plant by the Government to the Alabama Power Co. In short, this article expressly provides that at any time subsequent to three years after the termination of the war the United States shall have the option to sell the contractor, the power company, and the contractor shall, upon written demand of the United States, buy all its right, title, and interest in and to the Warrior extension and Warrior substation, with all rights appurtenant thereto at a value to be fixed by arbitration. It was further provided that the power company had a right to demand that the United States convey to it all of its right, title, and interest in said properties, at any time, provided the company would refund to the Government the amount of money it had expended.

This article further provides that the power company at any time after December 1, 1926, or such earlier period as the United States shall finally cease to take energy under this contract—and that is the condition of affairs now—may demand that the value of said properties be fixed by arbitration; and if the value so fixed is equal to or less than the amount of the so-called sinking fund to which I have referred, then the United States shall convey to the company all of its right, title and interest in and to said property. If the value fixed be greater than said fund, then the United States shall, upon payment by the contractor of the amount by which such value is greater than said fund, convey all of its right, title and interest in and to said property.

Subdivision 5 of article 22, about which so much has been said, provides that in the event that the contractor—that is, the power company—shall on demand of the United States fail or refuse to purchase the Warrior extension or Warrior substation, the United States may sell the same to another, but subject to the condition that the property shall not be operated but removed within six months after the sale has been consummated.

This subdivision of this article further provides that upon the consummation of such a sale with another purchaser the United States shall pay over to the contractor the whole of said accumulated funds less the amount, if any, by which the actual cost of said property shall exceed the price realized at such sale.

I mention this, Mr. Chairman, for the reason that in my opinion that clause in this subdivision of article 22 would enable the Government to recover from the power company the difference between the actual cost of its properties and the price that they received for same. That seems to have been overlooked by both the Attorney General and the Judge Advocate General.

Subdivision 7 of article 22 provides for the purchase of the transmission lines practically upon the same terms and conditions as applying to the extension and Warrior substation.

At this point, Mr. Chairman, I desire to direct particular attention to article 8 of the contract, which recognizes that the enlargement of this plant at the expense of the Government shall ultimately become the property of the Alabama Power Co. and shall be operated as a part of its system. That seems to have been overlooked by the Attorney General and the Judge Advocate General in their opinions.

This article provides that the contractor at its own expense, after the period of preliminary operation—which I understand to be the testing period of the plant, showing that it is capable of doing its work—shall maintain said plants, including all equipment, in first-class repair and in suitable condition for efficient and continuous operation. There is a clause in this article providing that in the event of damage to or destruction of the plants, the contractor, after the contractor begins to operate the same as a part of its system (that is, after the preliminary operation, using that language "as a part of its system") shall, at its own expense, promptly replace the property so damaged or destroyed. That expression "after the contractor begins to operate the same as a part of its system" is used in several places throughout the contract, showing the intention on the part of the parties to the contract, the Government and the power company, to be that this plant was to be erected at the expense of the Government but to be finally paid for by and become the property of the power company under the terms of the contract.

I may state that there are many other details in the contract, but I think it is not necessary to review them in so far as the point here involved is concerned.

Now we come to the objections that have been urged against the validity of the contract. All of these objections have been directed against Article XXII. It was first objected that the contract was invalid because it was dated December 1, 1917, when there was no act of Congress authorizing its execution. The facts are that it was not actually executed and delivered until about November 8 or 9, 1918, after

the passage of the acts of May 10, 1918, and July 9, 1918, to which I will hereafter refer.

I have here papers showing that the board of review did not approve this contract until November 8, 1918, which is not necessary to put in the record.

Mr. MARTIN. It was approved first by the board of review, consisting of seven members, and on the same day it was approved in writing by seven members of that board, as shown by the photostat copy of their acts of approval, which are available.

Mr. DENT. Our contention in this connection, of course, is that the law governing the validity of a contract must be the law of the date of its actual execution and delivery, regardless of the date adopted by the parties.

The next objection urged was that the contract is in violation of the public policy declared in section 124 of the national defense act, which prohibited the Government in the construction and operation of nitrate plants from constructing or operating the same in conjunction with any private corporation. Mr. Martin has put into the record the facts showing that the plants at Muscle Shoals were constructed under war-time acts and not under section 124 of the national defense act. However, in addition to this it is perfectly manifest upon a reading of the contract that the Alabama Power Co. simply agreed to sell to the Government electric energy for the construction and operation by the Government of the plants at Muscle Shoals. The contract does not give the power company any voice whatever in the method or manner either of construction or operation of any of these plants. It might well be contended, because the Alabama Power Co. furnishes power to the Birmingham Street Railway that it is operating the street railroad in conjunction with the street-car company. Upon both of these points the Attorney General in his opinion overruled the Judge Advocate General's opinion, the Attorney General holding that the validity of the contract depended on the law of its actual date, and that section 124 of the national defense act had nothing to do with it. The Attorney General did hold, however, that Article XXII, in so far as it gave an option to the power company to purchase this enlarged plant and to arbitrate the price, was void. He bases his opinion upon the well-established principle of law that an agent with authority merely to sell has no right to give an option. We think that the opinion of the Attorney General has missed the mark entirely, because there is no question of agency involved in this contract. If the contract is valid at all, it is a contract between two principals—the Government on the one hand and the power company on the other. If the Government was authorized by any act of Congress to enter into the contract and the contract was entered into by officials authorized by law to make the contract, then the contract is the contract of the Government itself as principal. The Supreme Court of the United States has repeatedly held that the United States Government, within the sphere of its constitutional limitations, is as a body politic capable of making contracts just as any private corporation.

In this connection I would like to insert in the record so much of the act of July 9, 1918, to which I have referred, as bears upon this question. I do not quote the act of May 10, because the act of July 9 is practically the same as the act of May 10. The act of July 9 simply enlarged the powers contained in the act of May 10.

It is not very long, Mr. Chairman, and I will read it. The act reads as follows:

"That the President be, and he hereby is, authorized, through the head of any executive department, to sell, upon such terms as the head of such department shall deem expedient, to any person, partnership, association, corporation," etc., "any war supplies, material, and equipment, and any by-products thereof, any building, plant, or factory acquired since April 6, 1917, including the lands upon which the plant or factory may be situated for the production of such war supplies, materials, and equipment which during the present emergency may have been or may hereafter be purchased, acquired, or manufactured by the United States."

The CHAIRMAN. That was the act of July, 1918?

Mr. DENT. Yes, sir.

It will be observed that this act authorizes the President, through (not by) the head of any executive department, to sell, and to sell upon such terms as the head of such department shall deem expedient. In this connection I wish to state, without making the record too large, that subsequent to the passage of this act the Secretary of War issued a general order authorizing this act to be carried into effect through the heads of the various bureaus of the War Department (in this particular instance Major General Williams, of the Ordnance Department). The head of the bureau was authorized to make these sales subject to the approval of the Purchase, Storage, and Traffic Division of the General Staff. This particular contract was made through the Ordnance Department in accordance with the order of the Secretary of War and received the approval of the Purchase, Storage, and Traffic Division of the General Staff.

I wish to call attention, Mr. Chairman, to the fact that the Attorney General in his opinion states in substance that the order of the Secretary of War authorizing these contracts to be made through the various departments with the approval of the Purchase, Storage and Traffic Division states that the order itself provides that the sale must be made for cash at public auction, overlooking the language of the order of sale as follows:

"Upon the receipt of such approval from the Director of Purchase, Storage and Traffic, such supplies as are intended for sale to persons, partnerships, and associations will then be disposed of, unless otherwise directed by the Director of Purchase, Storage and Traffic, for cash." "Unless otherwise directed," the Attorney General overlooked completely. In this case it was otherwise directed, because the contract was made in this form and received the approval of all the necessary officials of the War Department.

The CHAIRMAN. Did you appear before the Attorney General when he rendered this decision?

Mr. DENT. I did, Mr. Chairman. I appeared before the Attorney General and we discussed the law informally; but our whole argument was directed to a criticism of the Judge Advocate General's opinion, and this point was not raised. The Attorney General found this point after we left. He sustained us and overruled the Judge Advocate General. He decided this case, however, upon a point not suggested in the discussion there.

As I stated a few moments ago, all of the objections to the contract seem to be directed to article 22, which is the article providing that the Government may demand that the power company buy, on the one hand, and the power company demand that the Government sell, on the other, the additional equipment put upon the lands of the Alabama Power Co. at the expense of the Government during the war, the Judge Advocate General holding that article invalid for one reason and the Attorney General holding it invalid for another. We insist that article 22 is a binding and valid obligation, and stand ready to carry out our part of the contract.

However, we further insist, as a legal proposition, that if article 22 is stricken out of the contract as being entirely invalid and void, then the entire contract must fall; because this article can not possibly be severed from the other portions of the contract. If this be true, the Government would then be in the attitude of having entered upon the lands of the power company and placed valuable improvements thereon without any contract for the repayment of the money for the improvement or the removal of the property therefrom. Under the common law, which is the law of Alabama in this respect, the title of such improvements attaches to the soil and becomes the property of the owner thereof. We do not insist, however, upon any such construction of the contract.

There is one other act to which I desire to direct attention, and which I think would protect this contract, even if it was not executed in the manner provided by law. It is the act of Congress approved March 2, 1919 (40 Stat. L., p. 492), entitled "An act to provide relief in cases of contracts connected with the prosecution of the war, and for other purposes." I will read its important provisions:

"That the Secretary of War be, and he is hereby, authorized to adjust, pay, or discharge any agreement, express or implied, upon a fair and equitable basis that has been entered into in good faith during the present emergency and prior to November 12, 1918, by any officer or agent acting under his authority, direction, instruction, or that of the President, with any person, firm, or corporation for the acquisition of lands, or the use thereof, or for damages resulting from notice by the Government of its intention to acquire or use said lands, or for the production, manufacture, sale, acquisition, or control of equipment, materials, or supplies, or for services, or for facilities, or other purposes connected with the prosecution of the war, when such agreement has been performed in all or in part or expenditures have been made or obligations incurred upon the faith of the same by any such person, firm, or corporation prior to November 12, 1918, and such agreement has not been executed in the manner prescribed by law."

That act, Mr. Chairman, you perhaps remember, was passed at the instance of the Secretary of War. It was reported to the House Military Affairs Committee, as I happened to know at the time, that there were contracts amounting in value to something like \$1,000,500,000 that had been entered into by the War Department during the war that did not conform to the statutory requirements, and Congress passed that act in order to relieve parties who in good faith had entered into these contracts with the Government. That act authorizes the Secretary of War to adjust, pay, or discharge contracts. I contend that the word "discharge" means to carry into effect, to fulfill a contract although it may not have been executed in the manner

prescribed by law. In this connection I wish to make the further statement that it appears in the hearings before the House Military Affairs Committee, and I think it is a matter of common knowledge that the contract entered into between the Alabama Power Co. and the Government is similar in its general terms to contracts that were made both by the Army and the Navy during the war where the Government put increased facilities in some manufacturing plants owned by a private person or corporation. This was the usual form of contract adopted. Some provided that the Government could fix the price, and if the owner of the plant did not agree the Government would have to remove it. The contract in this instance, we contend, is fairer than any, because our contract compels us to pay the Government the fair value of the property which the Government at its expense put upon our land.

The act of July 9, 1918, I wish to say, because I know this of my own knowledge, was prepared in the War Department and sent to the Military Affairs Committee of the House with a request for early action. It was a rider on the Army appropriation bill of that year, along with other legislation requested by the Secretary of War, so that it is apparent that when the act of July 9, 1918, was drafted in the War Department, it was designed to meet just exactly this situation; that is to say, to take care of the form of contracts that were made by the War Department during the existence of the war, but which were at the time of execution authorized by law.

I should have stated in referring to the opinion of the Attorney General that article 22 not only gives the United States Government the right to demand that the Alabama Power Co. shall buy this property, but article 24, under the heading of "Arbitration," provides that any award, when signed by any two arbitrators, shall be final and conclusive upon both parties. So that it can not possibly be true, as stated by the Attorney General, as a matter of fact, that the Power Co. had the option to refuse to fulfill the award after the arbitration had fixed the price. The Attorney General evidently overlooked that feature of the contract.

Just one other point, Mr. Chairman, and then I am through.

In Mr. Ford's original proposition he called upon the Government to acquire the entire plant at Gorgas and turn it over to him. Before the Military Affairs Committee of the House—and I presume before this committee also—he subsequently amended his order so as to request that the Government simply assign to him whatever rights it may have in the Gorgas plant. We contended that this contract is not an assignable contract either at common law or under the terms of the contract itself, except as provided in article 23 of the contract. That article simply authorizes the Government—

The CHAIRMAN. That article is the one that authorizes the Government to sell to some one else if the Alabama Power Co. does not buy, is it?

Mr. DENT. No, sir. The article in regard to assignment is the article which authorizes the Government to assign to its successors at Muscle Shoals the right to take energy from the Alabama Power Co. just as it is. That is the only right that it can assign. If Mr. Ford should purchase the plant, then Mr. Ford could have assigned to him the right to make us give him electric energy during the period of the contract which, by the way, expires in 10 years. It provides, however—

The CHAIRMAN. It expires in less time than 10 years, does it not? Is it not in 1926?

Mr. DENT. Yes, sir.

The CHAIRMAN. That is less than 10 years.

Senator HEFLIN. Ten years from the time it was entered into.

Mr. DENT. Yes, sir.

That article further provides that the successor to the Government who desires to accept such assignment and transfer shall so signify in writing and shall thereupon be deemed to have accepted and assumed all the obligations of the United States under the contract in relation to the operations thereby assigned and transferred.

Mr. Ford in his proposition does not do that. On the contrary, the bill offered by the minority of the Military Affairs Committee of the House in section 12, providing for the assignment and transfer to the company of the rights of the Government in the Gorgas plant, contains this clause:

"But nothing in this paragraph shall be held to affect any question of the validity of any provision of the said contract."

He does not agree to accept the terms of the contract.

The CHAIRMAN. That that you have just read from that bill is an extract from Mr. Ford's offer?

Mr. DENT. Yes, sir; it is an extract from Mr. Ford's offer.

This article 23 further expressly provides, in the matter of assignment and transfer, that the right to assign and transfer shall not include the provisions of article 12. That is the article which gives the Government the right to demand that the com-

pany buy and the company the right to demand that the Government sell. That is not assignable, by the express terms of that article.

Mr. Chairman, you referred to the provision of the contract, subdivision 5 of article 12. That authorizes the United States to sell the Warrior extension and Warrior substation in the event that the company shall fail or refuse to purchase on demand, as above stated.

The CHAIRMAN. Yes. That is in article 22.

Mr. DENT. In article 22; yes.

The CHAIRMAN. Is there any other provision in the contract that authorizes the Government to sell except that one?

Mr. DENT. None.

I believe, Mr. Chairman, that states the legal aspect of this question.

The CHAIRMAN. All right.

Mr. DENT. I want to promise you that I will not abuse the record by cumbering it, but when I correct my statement I would like possibly to add a little.

The CHAIRMAN. All right.

We will adjourn until 10.30 to-morrow morning.

(Thereupon, at 1.30 o'clock p. m., the committee adjourned to 10.30 o'clock a. m. Thursday, June 22, 1922.)

MUSCLE SHOALS.

THURSDAY, JUNE 22, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), Capper, Ladd, Norbeck, McKinley, Smith, and Heflin.

The CHAIRMAN. The committee will come to order.

ADDITIONAL STATEMENT OF MAJ. J. H. BURNS, ORDNANCE DEPARTMENT, UNITED STATES ARMY.

The CHAIRMAN. Major Burns, I have called on you for certain information not only as to what is already in the testimony, so as to summarize it for us, but as to some other propositions that are probably not in the record that I have asked you to get data on. Are you now ready to report?

Major BURNS. Yes, sir. I have a summary of the Muscle Shoals project, in accordance with your instructions.

The CHAIRMAN. I would be glad to have you go on in your own way now and give it to the committee.

I will say to the committee I have not, of course, as the major knows, asked him to back up any proposition or anybody's ideas. I have asked him to get the cold facts as nearly as he can in relation to several things that we were somewhat in doubt about, and I have asked him also to summarize that the evidence shows—as you know he has been here all the time—so as to get it in a smaller space for the use of the committee and Members of Congress. I have not gone over his report myself, and the major will give us his conclusions just as he has reached them.

Senator HEFLIN. I have to be on the floor of the Senate at 11 o'clock and I want to ask him before he starts in with this statement if he agrees with Colonel Cooper as to the upkeep of Dam No. 2—\$75,000 or \$80,000 a year?

Major BURNS. The data that we have been able to obtain indicates that Colonel Cooper's estimate is low. We believe that—

The CHAIRMAN. I will just say if that is coming on in this report, Senator, you would not want him to go into it now, if he has got it in his order in the summary here, would you?

Senator HEFLIN. Except I wanted to question him.

The CHAIRMAN. That is one of the questions I asked him to look up for us.

Senator HEFLIN. You agree with him that it would cost that much or more to upkeep the dam?

Major BURNS. Yes, sir; that is correct. Unfortunately it is hard to get actual data, and it is more or less of an estimate as to what you should charge as the maintenance of the dam.

Senator LADD. Does it include, may I ask, the locks, or just the dam itself?

Major BURNS. Our figures includes only the dam. We have eliminated, in our estimate, depreciation and maintenance charges of the locks.

The CHAIRMAN. You have eliminated, also, the power house that Mr. Ford agrees to take care of?

Major BURNS. Yes, sir; and we have charged against the amount of money that is required to construct the dam itself, less the locks and power house, one-half of 1 per cent per year as the average yearly maintenance cost.

Senator HEFLIN. Your decision is that it would cost more than \$75,000 a year to upkeep the Dam No. 2?

Major BURNS. Yes, sir.

Senator HEFLIN. Without the locks or power house or anything else?

Major BURNS. Yes, sir. I want to say that it is a question of judgment, and I can not back it up with data.

Senator MCKINLEY. How many do you estimate?

Major BURNS. I can get that for you.

The CHAIRMAN. I would suggest to the members of the committee that the Major has arranged that in his own order here. I don't know where that comes in.

Senator HEFLIN. Let him go on in his own way. I just wanted to get that information before I had to go. That is as far as I want to go, so far as I am concerned.

The CHAIRMAN. All right, Major, go ahead.

Major BURNS. I have divided the Muscle Shoals project up into the following main headings: I, Description of present holdings; II, Utilization and sources of nitrogens; III, Navigation possibilities of Tennessee River; IV, Power possibilities of Muscle Shoals; V, Relation of Muscle Shoals to fertilizers; VI, Relation of Muscle Shoals to nitrogen preparedness in case of major war; VII, General summary; and VIII, Recommendations.

Each of these subjects will be discussed in turn.

1. Description of present holdings. The following framework is followed:

1. General subdivisions and control.
2. Nitrogen-fixation plants: (a) United States nitrate plant No. 1; (b) United States nitrate plant No. 2; (c) Gorgas power plant; (d) Warrior-Sheffield transmission line; (e) Waco quarry.

3. Development of Tennessee River: (a) Wilson Dam.

4. Summary of costs and salvage values of Government holdings at Muscle Shoals.
1. General subdivisions and control: The Government project at Muscle Shoals is divided into two main subdivisions: (1) Plants for the fixation of atmospheric nitrogen for use in munitions of war and in fertilizer; and (2) development of the Tennessee River from the standpoint of hydroelectric power and navigation.

All of the Muscle Shoals work has been conducted for the Government by the War Department. The plants for the fixation of nitrogen have been under the direct charge of the Ordnance Department of the Army, and the development of the Tennessee River has been under the direct charge of the Corps of Engineers of the Army.

For the fixation of nitrogen there have been erected nitrate plant No. 1 at Sheffield, Ala., and nitrate plant No. 2 at Muscle Shoals, Ala., together with the latter's adjuncts: namely, the Gorgas power plant located on the Warrior River at Gorgas, Ala., 90 miles south of Muscle Shoals; the Warrior-Sheffield Transmission Line, connecting this power plant with nitrate plant No. 2; and the Waco Quarry located near Russellville, Ala., about 26 miles south of nitrate plant No. 2.

For the development of the Tennessee River the Government has started the construction, at Muscle Shoals, of Dam No. 2, the official designation of which is the "Wilson Dam."

2. Nitrogen fixation plants—(a) United States nitrate plant No. 1: Construction of this plant was started under the authority contained in the nitrate supply section, or section 124, of the national defense act approved June 3, 1916. This act required especially that investigation be made as to the best means of producing nitrates for munitions of war and for fertilizers, and authorized the President to construct the necessary plants, both chemical and power, to put into effect the conclusions derived from such investigation.

After the passage of the act, the Secretary of War appointed several committees made up of prominent scientists and business men of the country to determine the best method to carry out the provisions of the act. Such committees finally recommended that a plant be erected for the fixation of nitrogen by the synthetic ammonia process. They recommended the General Chemical Co.'s modification of the German Haber process. This General Chemical process had not yet been established on a successful basis and only preliminary work thereon had been done. They also recommended that a plant be created for the oxidation of part of this ammonia into nitric acid.

The above program was followed in the construction and development of the plant, except that there was added to the program a plant for the concentration to a strength of about 97 per cent of a part of the nitric acid obtained from ammonia oxidation, the strength of which is about 50 per cent. There was also added a plant for the manufacture of ammonium nitrate to assist in supplying explosives required in the World War.

Construction was started in the late summer of 1917 and was essentially complete at the time of the armistice. Construction was in accordance with the agreement with the General Chemical Co. dated July 14, 1917, in which the General Chemical Co. allowed the Government use of its process without the payment of royalty if the production of the plant were used for munitions, or with the payment of a royalty of \$5 per ton of fixed nitrogen if the production were used in fertilizer. The Judge Advocate

General of the Army has held that this contract may be considered as terminated. He has likewise held in substance that there is no restriction on the Government in the sale of this property.

As the plant now stands it consists of a synthetic ammonia plant with a rated capacity of 30 tons of ammonia per day, a plant for the oxidation of part of this ammonia into nitric with a rated capacity of the equivalent of 45 tons of 100 per cent nitric acid per day, a plant for the concentration of the nitric acid so formed to a strength of some 97 per cent with a capacity of the equivalent of 12 tons of 100 per cent nitric acid per day, and a plant for the conversion of the ammonia and nitric acid into ammonium nitrate to a capacity of 22,000 tons of ammonium nitrate per year. There exists also a steam plant with a capacity of about 5,000 kilowatts. The nitrate plant contains 112 unfurnished permanent houses complete with furnaces, electric lightning and bathroom facilities; one unfurnished bachelor quarters of permanent construction with all improvements and containing accommodations for 35; 80 unfurnished temporary houses with no improvements (practically a construction camp); 8.6 miles of macadam roads; 8 miles of sewers; 4½ miles standard gauge railroads; water plant and other necessary auxiliaries. The site consists of about 1,900 acres.

In the development and operation of the plant great difficulty was encountered in the synthetic ammonia process, and this part of the endeavor was not a success. It was made to work periodically for a few days at a time, but it always broke down. The remainder of the plant, however, was tested out and is successful and can be depended upon to produce its rated capacity of satisfactory material.

It should be realized, however, that this was the pioneer plant in America for the fixation of nitrogen by this process and it is hardly fair to expect that it should have worked thoroughly satisfactorily in its initial effort. The experiences gained at this plant have undoubtedly been of great benefit to the Atmospheric Nitrogen Corporation, an affiliated company of the General Chemical Co. and subsidiary of the Allied Chemical Corporation, which has been successful in the design, construction, and operation of a 10-ton ammonia plant following this general process located at Syracuse, N. Y.

The Ordnance Department has made quite extended studies for the purpose of reconstructing this plant so that it could be expected to satisfactorily operate. The Ordnance Department believes that such an objective can be accomplished. To reconstruct it upon the smallest scale that will give commercial knowledge, or approximately 2 tons of ammonia per day, and to operate it for a period of about six months in order to establish the success of the plant would cost approximately \$1,250,000. To reconstruct the plant so that it would be capable of producing its rated capacity, or 30 tons of ammonia per day, and to operate it for a short period in order to establish it upon a successful operating basis, would cost approximately \$4,000,000. To install the necessary sulphate of ammonia plant which would be required if its product were to be made available to the fertilizer trade, would cost approximately \$750,000 additional.

A description of the synthetic ammonia process of fixing nitrogen and the probable costs of manufacture are included in the chapter on "Sources of nitrogen and processes of fixing atmospheric nitrogen."

The plant is at present in standby condition awaiting decision as to its disposition. Standby expenses are some \$25,000 to \$30,000 per year.

In round numbers the cost to the Government of the plant was \$13,000,000, divided as follows:

United States nitrate plant No. 1.

Chemical plant.....		\$7, 134, 785.00
Oxidation plant.....	\$1, 706, 976.63	
Soda-recovery plant.....	6, 256.10	
Process plant.....	4, 216, 854.85	
Neutralization plant.....	109, 978.56	
Coal and coke storage.....	35, 651.76	
Gas plant.....	551, 591.18	
Concentration plant.....	289, 083.20	
Ammonium nitrate plant.....	218, 390.72	
Shops.....		314, 076.00
Machine shop.....	97, 624.51	
Storehouse.....	140, 686.72	
Oil house.....	2, 492.81	
Warehouses.....	73, 271.96	
Power house.....		1, 271, 665.23
Land.....		615, 127.20

Village.....		\$2, 526, 276.28
Permanent village.....	\$1, 597, 978. 26	
Temporary village.....	928, 298. 02	
Public works.....		1, 026, 011. 60

Sewer system.....	212, 297. 33	
Water system.....	496, 323. 81	
Railways.....	179, 438. 58	
Electric distribution system.....	101, 288. 88	
Total.....		12, 887. 941. 31

The War Department does not believe that this plant is necessary for the achievement of munitions preparedness.

The estimated salvage value of this plant as scrap only is \$600,000. This assumes that practically no parts of the plant would be sold on the basis of their being used in present location and that it would be necessary to practically demolish the plant and then sell parts with value to the highest bidder. The figure of \$600,000 represents about 3½ per cent of the cost of the project plus \$150,000 for the land. This figure has been developed from the Ordnance Salvage Board experience in salvaging war plants, with due consideration of the special character of the equipment. If appreciable parts of the plants could be used in present location the salvage value should correspondingly increase.

Senator NORBECK. When you speak of \$150,000 for the land, that is the land and these residences on it?

Major BURNS. No, sir. That is the land only. We figure that the land could be sold for \$150,000. We are assuming you would have to scrap the houses.

Senator NORBECK. You are figuring the houses in the other salvage?

Major BURNS. Yes, sir. Of course, if you could sell the village as a going village and get people to live in it, you could undoubtedly get more than we are stating here.

The CHAIRMAN. That is nitrate plant No. 1?

Major BURNS. Yes, sir.

Senator MCKINLEY. Four and three-quarter million dollars it would take to put it into operating shape?

Major BURNS. As a fertilizer plant, yes, sir.

(b) United States nitrate plant No. 2: This plant is a war plant constructed under the authority of war appropriations for the purpose of assisting in meeting the demands for explosives which were developed by World War requirements. It was designed to produce the high explosive ammonium nitrate, which was in turn to be combined with another high explosive, or T. N. T., produced in other plants of the country. This combination, which was called amatol, was loaded into high explosive shells as the bursting charges thereof.

Ammonium nitrate is formed by the combination of ammonia and nitric acid. During the war there was a serious shortage of ammonia and a shortage was feared in Chilean nitrate, from which nitric acid is ordinarily manufactured. The No. 2 plant was designed to fix the nitrogen of the air into the form of ammonia and then to convert this ammonia into nitric. It was, therefore, able to assist in relieving the shortage that existed in ammonia and at the same time to reduce by a very considerable amount the quantity of nitrate of soda which must be imported from Chile.

The American Cyanamid Co. had been operating for several years the only successful nitrogen fixation plant on the American Continent. This company had been using the cyanamid process of nitrogen fixation. The Government, therefore, in order to be sure of supplying its needs, selected this process and contracted with this company for the design and operation of the necessary plant. This company, in turn, organized the Air Nitrates Corporation as a subsidiary for the purpose of carrying out the contract with the Government. The final contract required the company to not only construct and operate plant No. 2, but also to construct and operate two additional nitrate plants, Nos. 3 and 4, the combined capacity of which would have been equivalent to the capacity of United States nitrate plant No. 2.

The contract paid to the company a construction fee dependent upon the cost of construction and in addition operating fees and royalty fees for the use of its process during the war and royalty fees only for the use of its process after the termination of the war. These latter royalties amount to \$30 per ton of nitrogen fixed. There is also a contract with the Air Reduction Co. which grants to that company for the use of its process in extracting nitrogen from the air by the liquid air process royalties to the extent of \$2.72 per ton of nitrogen fixed. All royalty fees terminate about 1931.

The contract with the Air Nitrate Corporation provides also that such corporation has the privilege of purchasing the plant upon as favorable terms as the United States is willing to accept from any other bidder.

The plant consists of a calcium carbide plant, including necessary facilities for burning limestone and preparing coke, a plant for the extraction of nitrogen from air by the liquid air process, a plant for the welding together of calcium carbide and nitrogen to form cyanamid, a plant for the conversion of cyanamid into ammonia, a plant for the conversion of half of the ammonia so formed into nitric acid, and a plant for the combination of nitric acid and ammonia for the formation of ammonium nitrate. The plant has a capacity of 475 tons of calcium carbide per day, 600 tons of cyanamid per day, 150 tons of ammonia per day, the equivalent of 260 tons of 100 per cent nitric acid per day, and 300 tons of ammonium nitrate per day or 110,000 tons of ammonium nitrate per year. The capacity of this plant is five times the capacity of United States nitrate plant No. 1. It contains a 60,000-kilowatt steam plant which is able to supply about 75 per cent of the power requirements of the plant. It contains 186 permanent houses with electric lights, sewers, and water supply (practically unfurnished); 1 hotel with 100 rooms with modern improvements and furnished; 366 temporary housing facilities; 22.3 miles of improved roads; 37 miles of standard gauge railway; 20 miles of sewers; 16 miles of domestic and fire water supply; a 60,000,000-gallon reservoir together with necessary filtering and pumping plant; and a 50-ton per day ice plant. The site consists of 2,300 acres.

Construction was started in the early spring of 1918 and was substantially complete at the time of the armistice, except the 60,000 kilowatt steam plant. This latter was not completed until over a year later, although if it had been necessary it would probably have been completed in the spring of 1919. The test run of the chemical plant was made in the spring of 1919, which definitely proved that the plant is capable of producing at least its rated capacity of thoroughly satisfactory material. The steam plant was also proven satisfactory by a test run.

The cost of the plant in round numbers amounted to some \$66,500,000 divided as follows:

United States nitrate plant No. 2.

Chemical plant.....		\$35,984,090.55
Raw material and storage group.....	\$2,809,361.53	
Carbide group.....	5,768,305.82	
Cyanamid group.....	4,987,045.31	
Liquid air group.....	4,005,503.09	
Ammonia gas group.....	3,710,872.79	
Nitric acid group.....	12,627,103.80	
Ammonium nitrate group.....	1,236,075.39	
Process steam plant.....	559,577.74	
Laboratory.....	280,245.08

Water system.....	2,265,452.59	
Railways.....	2,025,478.13	

¹ Temporary buildings, the cost of which was \$5,174,377.19, have been allocated to the cost of the permanent plant as overhead.

Public works—Continued.

Trolley lines.....	\$173,393.99
Fencing.....	107,641.25
Telephone system.....	22,555.46
Electric distribution system.....	2,532,677.46
Inventories (approximately one-half of these inventories have not been disposed of).....	\$3,043,516.20
Muscle Shoals substation ²	189,843.99
Total.....	66,442,236.20

The plant is at present in stand-by condition and is being held by the War Department as a reserve plant for the assurance of an adequate supply of nitrogen in time of need. It is now costing at the rate of about \$100,000 a year to finance the caretaking force. This sum does not, however, cover the replacements that will undoubtedly be necessary after several years retention. This cost is covered in chapter "Relation of Muscle Shoals to Munitions Preparedness." The 60,000-kilowatt steam plant is under lease to the Alabama Power Co. which company must maintain such plant in good condition. It must also pay to the Government stand-by rental of \$10,000 per month, and in addition two mills for each kilowatt hour of energy that is generated by the plant.

In the terms of military preparedness, this plant is capable of fixing atmospheric nitrogen sufficient for the complete supply thereof of 12 divisions organized, equipped, and fought in accordance with conditions in existence at the time of the Armistice in 1918. Proper nitrogen preparedness at the present time requires that this plant be retained in available condition for fixing nitrogen for munitions purposes.

The CHAIRMAN. How many men in a division?

Major BURNS. It is a variable quantity of approximately 40,000.

The CHAIRMAN. And this you say will supply 12 divisions?

Major BURNS. Yes, sir. It will supply about enough nitrogen, in round numbers, for a half million men.

The CHAIRMAN. All right.

Senator NORBECK. Does that half million mean men in the field in actual service?

Major BURNS. It means 12 divisions with all their auxiliary troops. The figure of 40,000 men to a division includes a combatant force of about 20,000 men and a non-combatant force of the same number. These latter are engaged in supply work of one kind or another.

Senator NORBECK. It means an Army in actual work, part of which is on the fighting line?

Major BURNS. That is correct. It means an Army of about 500,000 men, about half of whom are continuously on the battle front. As another indication, during the World War we mobilized about 4,000,000 men but we actually got on the firing line as combatant troops only 750,000 men, and those 750,000 men represented 30 divisions. So this plant would supply the nitrogen for nearly half as many divisions as we were able to fight in the World War.

The CHAIRMAN. How much additional money would be required to put that plant in shape to make fertilizer? As I understand it, when you get about so far in your process in making explosives, if we are going to make fertilizer we would branch off in a different direction, and this plant is not now equipped to make it.

Major BURNS. That is correct. If you were going to make ammonium sulphate it would require an additional expenditure of about three and one-half million dollars for the sulphate plant.

The CHAIRMAN. It would take, then, about three and a half million dollars to equip this plant for the fertilizer business?

Major BURNS. It would take between three and a half and four million dollars, because in addition to the sulphate plant there would have to be erected some storage warehouses, etc.

Senator McKINLEY. Well, do you use that raw ammonium sulphate for fertilizer?

Major BURNS. Yes, sir; that goes into—

Senator McKINLEY. It goes into making fertilizer.

Major BURNS. And in some cases they use it directly on the soil.

The salvage value of this plant as scrap only is estimated at \$7,250,000. This estimate is likewise a result of Ordnance Salvage Board experience in selling war plants. This assumes that practically none of the plant could be used in present location and that plant would have to be practically demolished and salable parts

² Located on Government-owned land at Muscle Shoals, Ala.

disposed of to highest bidder. This amounts to about 11 per cent of cost. It is not believed that this percentage could be achieved except for the large quantity of platinum that goes with the plant and the large quantities of construction and other easily salable material available including four sulphuric-acid units. From the standpoint of an operating concern, it would be worth only what it could be made to earn a reasonable return upon. With present knowledge it is not believed that the cyanamid plant could be operated with a profit of power should cost in excess of 1 mill per kilowatt hour. Even at this price the margin would be so slight that it would be more or less negligible. However, certain parts of the plant might be operated at a profit. This seems to be true in the case of the 60,000-kilowatt steam plant, and it is believed that this plant might be disposed of for some \$6,000,000.

The most advantageous method of salvaging the No. 2 plant would be to sell all parts possible on basis of operating concern and balance on basis of scrap. In this way it might be possible to obtain a return of some \$11,650,000 or some 18 per cent of cost.

(c) Gorgas power plant: United States nitrate plant No. 2 requires for its full operation approximately 80,000 kilowatts of power. Part of this was to be supplied by the 60,000 kilowatt steam plant of nitrate plant No. 2 and part by the 30,000 kilowatt plant which was constructed by the Government as an addition to the already existing 20,000 kilowatt plant of the Alabama Power Co. located on the Black Warrior River, Gorgas, Ala.

It was realized when the No. 2 plant was started that the development of the required power plant would require a longer time than the development of the chemical plant proper. It was also desirable that an appreciable amount of power be available at an early date for construction purposes as well as for the initiation of operations. The Alabama Power Co. was the only large producer of power in the near vicinity of Muscle Shoals and therefore was the only company capable of delivering to the Government at an early date the quantity of power necessary. A contract was therefore entered into between the Ordnance Department and the Alabama Power Co. providing for an early delivery of power to be made by that company and providing further for the construction and operation by that company of a 30,000 kilowatt extension to their already existing Gorgas plant, which would assure to that company sufficient capacity to meet the added demand of the Government.

This contract provided in substance that this extension would be constructed by the Alabama Power Co. upon land belonging to the Alabama Power Co. at the expense of the United States. The contract provided also for the Alabama Power Co. to operate this plant and to supply power therefrom or from its system at certain definite figures outlined in the contract. In case the power plant was operated for the benefit of the Alabama Power Co. only, that company was to pay certain rentals to the United States for such use. The contract provides also that the plant would be sold to the Alabama Power Co. within a certain limit after the proclamation of peace at a price to be fixed by a board of arbitrators, and provided further that in case such sale could not be consummated the plant would be removed from the land of the Alabama Power Co. The contract does not permit the Government to assign its rights in the matter of sale of this property.

Construction was started early in 1918 and was essentially completed at the time of the armistice. Power was available to the Government at an earlier date than this, however, from the Alabama Power Co.'s system.

As already stated, the plant was constructed as an addition to the already existing plant of the Alabama Power Co. The Government unit and the Alabama Power Co. unit are both under the same roof. The Government unit has its own apparatus for supplying coal, its own apparatus for disposing of ashes, its own boiler plants, its own generating plant, and its own switchboard. The trackage is mutually owned. The water supply is mutually owned. The distribution system for taking the power from the switchboard is mutually owned. The steam boiler capacity of the Government unit is sufficient to take care of the generating capacity of from 50,000 to 60,000 kilowatts. The generating unit has a capacity of 30,000 kilowatts. In addition to the power plant there was constructed a substation with necessary control apparatus sufficient to take care of 66,000 kilowatt capacity. There was also constructed a short railroad called "The Drifton Extension" for the purpose of connecting this site with commercial railways. Housing facilities, etc., sufficient to accommodate some 35 white families and 11 colored families were also constructed.

The cost to the Government, in round numbers, amounted to \$3,850,000, divided as follows: Power plant, \$3,417,702.70; Warrior substation, \$383,756.35; Drifton Railroad, \$50,421.94; total, \$3,851,880.99.

This plant is now under lease to the Alabama Power Co. in accordance with the contract existing with such company. The company must maintain the plant and

pay to the Government $1\frac{1}{2}$ mills for each kilowatt hour of energy generated. This is producing a yearly return to the Government of some \$75,000 to \$100,000 per year.

The salvage value of this plant as scrap only amounts to some \$800,000. However, the contract with the Alabama Power Co. requires that this plant should be sold on basis of operating concern, in which case it has a salvage value in the neighborhood of \$3,000,000.

The CHAIRMAN. You said that the plant cost three million and something. I thought the cost was four million and something.

Major BURNS. I was speaking only of the Gorgas plant proper. You are thinking of both the Gorgas plant and the transmission line.

The CHAIRMAN. I always consider the transmission line and the Gorgas plant together.

Major BURNS. When you add the cost of the transmission line, the total is about \$4,800,000, as I recall it.

(d) Warrior-Sheffield transmission line: For the purpose of connecting nitrate plant No. 2 with the Alabama Power Co.'s transmission system and the Gorgas power plant, there was constructed by the Alabama Power Co. under contract with the Government the Warrior-Sheffield transmission line. This line is approximately 90 miles in length. It is constructed upon land owned or controlled by the Alabama Power Co. The contractual obligations between the contractor and the Government are substantially the same with reference to this transmission line as they are with reference to the Gorgas power plant.

Its cost to the Government amounted, in round numbers, to \$960,000.

This line is at present under lease to the Alabama Power Co., as a part of the agreement for the utilization of the steam plant at nitrate plant No. 2. The power company is required to maintain and guard the transmission line.

Its salvage value on basis of scrap only is \$60,000. However, the contract with the Alabama Power Co. likewise requires that this transmission line be sold on basis of fair value as going concern in which case its value amounts to some \$675,000.

The CHAIRMAN. It is your judgment, then, that the Gorgas power plant plus the transmission line, its fair value would be something over \$3,000,000?

Major BURNS. Yes, sir. I am submitting the figures that were submitted by the Chief of Ordnance with reference to the salvage value of these plants. When the offer of the Alabama Power Co. came in a short time ago, or two and a half million dollars for all this property, we checked up the value of it more thoroughly in accordance with present market conditions, and I believe as a result of that check that the \$3,675,000 which we had in our original report is high. I think, though, that the minimum figure is at least \$3,000,000. That would amount to some five-eighths of its war-time cost.

The CHAIRMAN. It would be a little over 60 per cent.

Major BURNS. Yes, sir; a little over 60 per cent of its war-time cost.

(e) Waco quarry: For its successful operation, nitrate plant No. 2 requires a very large quantity of high-grade limestone. The daily consumption at the plant is some 1,200 tons of limestone. This, in turn, requires the quarrying of approximately 2,000 tons per day, inasmuch as the "fines" which are developed in the crushing plant can not be economically used in the manufacture of calcium carbide. The Waco quarry has been sufficiently explored to assure a sufficient quantity of high-grade limestone to supply the No. 2 plant for in excess of 50 years.

There is installed at the Waco quarry a crushing plant and the necessary facilities for its operation. A small part only of the quarry face has been opened up. A railroad has been constructed for the purpose of connecting the quarry with the nearest commercial railway. This branch is $1\frac{1}{2}$ miles in length. A few small houses have been constructed to house the operating force. The site consists of about 450 acres.

The quarry is now in stand-by condition and has one caretaker. It costs some \$2,500 per year to maintain it.

Its salvage value on basis of scrap only is \$102,000 and on basis of operating concern \$375,000. It is quite doubtful that it could be disposed of on latter basis.

The cost to the Government of the quarry amounted, in round numbers, to \$1,300,000.

3. Development of Tennessee River—(a) Wilson Dam: The data with reference to Wilson Dam has been taken from the testimony of Colonel Barden.

Construction of the Wilson Dam, sometimes called Dam No. 2, was ordered by the President on February 23, 1918, under the authority contained in section 124 of the national defense act. All the money spent on the dam is from that fund. There has been a total allotment to the dam of \$17,159,610.42, of which \$16,890,507.45 had been expended or obligated as of April 1, 1922, leaving on that date an available balance of \$269,102.96. The dam is one-third completed.

The dam is divided into three parts—the lock on the right bank of the river; the spillway dam, which occupies the northerly three-fourths of the river bed; and the power house, which continues the dam to the left or south bank of the river. The total length, bank to bank, is approximately 4,500 feet. The dam section is 2,890 feet long, and the power-house section 1,184 feet. The remaining distance, or 326 feet, is taken up by the lock and abutment connections.

There are two locks in tandem—that is, one below the other—each 300 feet long by 60 feet wide, with $7\frac{1}{2}$ feet on the miter sills and a lift of $45\frac{1}{2}$ feet, or a total of 91 feet for both. The upper lock will be spanned at its upper end by a bascule bridge, carrying the highway across it from the north bank to the concrete arch bridge, which spans the remainder of the entire structure.

The spillway dam is composed of two sections—the nonoverflow and the overflow or spillway section. The former, adjacent to the lock, is only 180 feet long, extending to the original bluff line, where it connects with the spillway section. Both sections are nonreinforced gravity structures, surmounted, as already stated, by a concrete arch bridge. The spillway section provides for the regulated discharge of excess water over the crest by means of 63 controlling gates in order to maintain the pool above the dam at a fixed elevation. The pool extends upstream to the site of the proposed No. 3 Dam, a distance of 14.7 miles, and will have a surface area of 14,037 acres. The total height from the river bed to the top of the gates or pool elevation is 97 feet. The roadway is some 20 feet higher. The foundations extend 15 to 16 feet into the bedrock. The width of the dam at the bedrock is 101 feet, and the apron 59 feet wide, making a total width of 160 feet. The maximum head of water on the turbines will be 96 feet and the minimum 68 feet.

The power-house section is pierced by three penstocks for each generating set, each about 12 by 16 feet in size, which carry the water to the turbines. The electrical transformer and distributing apparatus will be located on the bluff overlooking the power house. A railway will be built, terminating beneath the cranes of the power house, and an ice and trash fender will extend from the north end of the power house to the south bank of the river. Four turbo-generator units have been ordered and parts thereof have already been delivered. The water turbines are capable of developing 30,000 horsepower each. The generators are 25,000 kilowatts, 12,000 voltage. Arrangements are included in the designs for a total installation of 18 units.

Gauge readings have been taken on the river almost continuously over a 50-year period. The lowest gauge readings, which occurred in 1904, give a minimum power of 71,800 horsepower. The maximum horsepower has been in excess of 1,100,000. The following table gives the quantity of power available for the percentages of time indicated: 87,300 horsepower, 99.4 per cent of the time; 100,000 horsepower, 97 per cent of the time; 141,000 horsepower, 83.3 per cent of the time, or 10 months; 205,000 horsepower, 66 $\frac{2}{3}$ per cent of the time, or 8 months; 306,500 horsepower, 50 per cent of the time, or 6 months; 600,000 horsepower, 20 per cent of the time, or 2 $\frac{1}{2}$ months, 1,100,000 horsepower, 7 per cent of the time, or five-sixths month.

If equipped with the complete 18 units, the total cost of the Wilson Dam would amount to \$45,500,000, or an additional expenditure of some \$28,500,000. If equipped with 8 units, the cost would be some \$40,300,000 or an additional expenditure of some \$23,200,000. If equipped with 4 units, the total cost would be some \$37,800,000, or an additional expenditure of some \$20,800,000.

The corps of engineers believes that it would take approximately three years to complete this dam.

No work is at present being done on the dam. There is a small force for guarding and maintenance purposes.

It is estimated that construction facilities and particularly the cofferdams and temporary structures of all kinds are depreciating at a rate of approximately \$400,000 per year, exclusive of the interest return that might be obtained from a completed structure. In other words, suspension of work is costing the Government a minimum of \$400,000 a year from the standpoint of deterioration alone. This figure does not take into consideration, however, the possible lower construction costs that may have been or be developed by reduction in costs of labor, materials, and freight.

4. Summary of costs and of salvage values of Government holdings at Muscle Shoals.

Item.	Approximate cost.	Salvage value.		
		As operating concern.	As scrap.	As operating concern and scrap.
United States nitrate plant No. 1.....	\$13,000,000	¹ None.	\$800,000	\$800,000
United States nitrate plant No. 2.....	66,500,000	² \$6,000,000	7,250,000	³ 11,640,000
Gorgas plant.....	3,850,000	3,000,000	890,000	3,000,000
Warrior-Sheffield transmission line.....	960,000	⁴ 675,000	60,000	675,000
Waco Quarry.....	1,300,000	357,000	102,000	357,000
Wilson Dam.....	17,000,000	(⁵)	(⁵)	(⁵)
Total.....	102,600,000	10,032,000	8,812,000	16,272,000

¹ None, with possible exception of power plant.² None, unless the Wilson Dam is completed, with the exception of 60,000 kilowatt steam-electric power plant which has value of possibly \$6,000,000. The value of United States nitrate plant No. 2 as an operating concern depends mainly upon the price which must be paid for power for its operation. If power is to cost \$0.004 per kilowatt-hour the plant has practically no earning power and therefore has no value. However, if power can be obtained at \$0.001 per kilowatt-hour, the plant has an earning capacity and corresponding value.³ Basis of steam plant as operating concern and balance of plant as scrap.⁴ Seventy-five per cent of cost.⁵ It is estimated that present-day replacement value of work already done on Wilson Dam amounts to some \$12,000,000, or about three-fourths of its war-time cost.

II. Utilization and sources of nitrogen. The following framework is followed:

1. Utilization of nitrogen: (a) For military explosives; (b) for fertilizers; (c) for industrial purposes.

2. Sources of nitrogen: (a) Organic nitrogen; (b) inorganic nitrogen (1) Indian and Chilean nitrate; (2) by-product coke ovens; (3) nitrogen fixation plants—arc process, cyanamid process, direct synthetic ammonia process.

3. Prices of nitrogen: (a) Average yearly prices (wholesale) for principal inorganic nitrogen materials used in fertilizers; (b) cyanamid process; (c) direct synthetic ammonia process—water-gas hydrogen; electrolytic hydrogen; (d) arc process; (e) summary of costs of fixing nitrogen.

4. Conclusions as to costs of fixing nitrogen in competition with ammonia sulphate and Chilean nitrate.

Utilization and sources of nitrogen: The following chart outlines the quantities of nitrogen utilized over a period of years and the sources from which such nitrogen has been taken. This chart includes only inorganic nitrogen and does not give figure for organic nitrogen.

Consumption and supply of inorganic nitrogen in United States 1902-1920.

Year.	Consumption.				Supply.			
	Agri-culture.	Industries.	Military.	Total.	Chilean nitrate.	By-product ammonia.	Fixed atmospheric nitrogen.	Total.
1902.....	14,600	28,200	1,500	44,300	34,900	9,400	44,300
1903.....	18,300	37,900	1,500	57,700	47,400	10,300	57,700
1904.....	17,600	33,400	1,500	52,500	39,700	13,000	52,700
1905.....	23,400	45,600	1,500	70,400	55,800	14,400	70,200
1906.....	29,000	52,400	1,500	82,900	64,300	18,400	82,700

1920.....	210,000	115,000	1,500	326,500	230,000	105,000	15,000	350,000

1 ton of nitrogen is equivalent to—

5.7 long tons of Chilean nitrate (or 6.4 short tons).

4.9 tons of ammonium sulphate.

4.5 short tons of cyanamid.

2.8 short tons of ammonium nitrate.

1. Utilization of nitrogen (a) for military explosives: Almost without exception all military explosives are nitrogen compounds. Owing to the slight affinity between nitrogen and the other elements with which it enters into combination, many of its compounds are unstable and can be decomposed with the almost instantaneous evolution of heat and gas.

Black powder, the original military explosive, and practically the only one up to some 30 years ago, has as one of its three constituents a nitrogen compound, saltpeter. Since 1890, however, nitration processes have been developed until now practically all modern explosives are made by treating various bases with nitric acid—for instance, smokeless powder from cotton and nitric acid; picric acid from carbolic acid and nitric acid; trinitrotoluene (T. N. T.) from toluol and nitric acid; fulminate of mercury from mercury and nitric acid; and ammonium nitrate from ammonia and nitric acid.

(b) For fertilizer: For plant growth, too, nitrogen in a chemically combined form in the soil is essential. Originally land was fertilized by placing back on it the animal and vegetable refuse of the farm, but this material, though of excellent quality, is not usually of sufficient quantity. As chemical knowledge has developed, however, study has shown that these organic or animal and vegetable materials can be supplemented by inorganic or mineral materials. As a result, practically all complete commercial fertilizers now contain, besides some form of organic nitrogen, a very considerable quantity of inorganic nitrogen, as well as the phosphoric acid and potash, also necessary for plant growth.

The requirement of nitrogen for fertilizer, though usually considered as a peacetime requirement, might be even more a war-time requirement, for while the population to be fed might not be reduced, available labor for the farms would be much reduced not only through enrollment in the Army but also through employment in munitions and war plants. The acreage under cultivation is therefore reduced, necessitating an increase in yield per acre. This can only be accomplished by using in addition to all possible labor-saving farm machinery, as much fertilizer and therefore as much nitrogen as possible.

(c) For industrial purposes: Nitrogen is also needed in many of the important chemical industries of the country. It is as necessary for commercial as for military explosives. Commercial explosive, such as dynamite, blasting powder, and the like, are used not only for practically all mining and quarrying operations, but to a rapidly increasing extent for road building, clearing land, digging ditches, and in other operations as a means of saving labor.

Nitrogen as nitrate is necessary, too, for the comparatively new and rapidly developing nitrocellulose product industry, which includes the manufacture of artificial leather, now almost universally used for automobile upholstery; of photographic films; of imitation ivory; and of all forms of celluloid. Nitrogen in this form is also needed for the manufacture of dyes, for the manufacture of sulphuric acid, and for the manufacture of a large part of our glass.

Nitrogen as ammonia is necessary for cold-storage plants and for the manufacture of artificial ice; it is found in nearly every home as household ammonia; and it is necessary for the production of several of the staple chemicals, including soda ash, which next to sulphuric acid is probably the most important commercial chemical; cyanide is used in extracting gold from its ores, and in insecticides.

2. Sources of nitrogen—(a) Organic nitrogen: The organic nitrogen from waste animal and vegetable materials is limited in amount and now can supply but a part of the fertilizer requirements. Almost no organic nitrogen goes into either military or other nonagricultural uses. The organic nitrogen materials include the animal and vegetable refuse of the farm, dried blood and tankage from the slaughterhouse, cottonseed meal from the oil mills, fish scrap, leather scrap, and similar materials. These were originally used almost entirely for fertilizers, but as many of them can be used to much better advantage as feed, they are being diverted more and more to that use, with the result that the present inadequate supply of these materials available for fertilizer is not only not keeping pace with the growth in the demand but is actually diminishing.

As an indication of the relations existing between organic and inorganic nitrogen in commercial fertilizers, the following table is inserted. The data have been consolidated by the Ordnance Department from data obtained from Agricultural Department, from Federal Trade Commission, and other available sources.

Nitrogen consumed in commercial fertilizer in the United States.

Year.	Nitrogen.			Per cent of organic nitrogen to total nitrogen.
	Organic.	In-organic.	Total.	
	<i>Tons.</i>	<i>Tons.</i>	<i>Tons.</i>	
1899.....	38,000	8,000	46,000	82
1904.....	48,000	16,000	64,000	75
1909.....	49,000	43,000	92,000	53
1914.....	80,000	88,000	168,000	47
1919.....	62,000	92,000	154,000	40

(b) Inorganic nitrogen: The inorganic, or mineral nitrogen, comes from three sources, each of which now normally supplies about equal quantities of the world consumption. These, in the order of their development as sources of supply, are the natural nitrate beds of India and Chile, and the by-product coke ovens, and the plants for fixing the nitrogen of the air.

(1) Indian and Chilean nitrate: For several centuries nitrate has been extracted from the soil of India and shipped as saltpeter to Europe and to this country. However, since their development, which began about 1830, the nitrate fields of Chile have been the world's chief source of supply of inorganic nitrogen, the production of India being insignificant in comparison. Even in spite of the tremendous development of the other two sources of inorganic nitrogen in the last few years, Chile still normally supplies about a third of the world's inorganic nitrogen requirements and nearly half of those of this country.

In addition to supplying nitrates for fertilizers, this source of nitrogen has been of great value to the world in the development of the chemical industry, as Chilean nitrate has been the substance out of which practically all of the nitric acid that the world consumed until starting of the World War was manufactured. As a result of the World War developments, however, we are now able to manufacture nitric acid out of ammonia, and our complete dependence upon Chile is therefore stopped.

The definite quantity of nitrate available in Chile is unknown. Various estimates have been made as to what its continuing life will be and these vary from 40 years to three or four centuries. It seems reasonable to believe, however, that the Chilean beds can continue to furnish nitrate at the rate of 3,000,000 tons per year for an additional century at least.

(2) By-product coke ovens: The next source of supply to assume importance was the by-product coke oven, by means of which the nitrogen contained in bituminous coal is recovered when the coal is coked. The by-product coke oven, as an important source of nitrogen supply, is a more recent development than the utilization of the nitrate beds of Chile, and even though to some extent outstripped in the last few years by the rapidly increasing number of plants for the fixation of atmospheric nitrogen, it now normally supplies about one-third of the world's inorganic nitrogen requirements and nearly half of those of this country.

By-product coke ovens were developed by the Germans and were first introduced into America about 1893. From that time until 1914, when the World War started, development was such that only 25 per cent of the coke used in the United States was coked therein. Since 1914 the increase has been quite rapid. The growth was developed during 1915 and 1916 by purchase by the Allies of the by-products at high prices. In 1917 and 1918 the Ordnance Department, in order to obtain increased supplies of ammonia and toluol, or two of the by-products, further speeded up construction. As a result of all these efforts the country is at the present time coking in by-product coke ovens about 60 per cent of all its coke. The further development of this industry is very much to be desired.

Whereas in manufacturing coke by the old beehive method there was produced only some 0.65 of a ton of coke, the by-product ovens will produce approximately 0.72 of a ton of coke or 10 per cent more from 1 ton of coal and in addition the following surplus by-products: 6,000 cubic feet of gas, 10 gallons of coal tar, 3 gallons of light oil, 5 pounds of ammonia. In general these by-products are worth about one-half as much as the coke.

(3) Nitrogen fixation plants: The other important source of nitrogen supply, the one most recently developed and the one most rapidly growing is the nitrogen fixation plant in which the nitrogen of the air is fixed to some other element or elements and

thus converted into usable form by means of one of the several chemical and electrochemical processes. This source will undoubtedly have to be developed as the main hope of supply for the future. Although the first commercial nitrogen fixation plant started operating only 16 years ago, there are now some 40 plants located in 12 different countries, which together normally supply about a third of the world's nitrogen requirements. The United States has lagged behind in this development. Less than 2 per cent of our present normal requirements can be supplied from plants operating in this country, and even if the idle Government plant at Muscle Shoals were to be operated it would supply only an additional 19 per cent, still leaving us with only a fifth of our nitrogen from fixation plants. If to this we add the 7 per cent which can be supplied by the Canadian plant of an American company, we still lag behind the rest of the world, as all these plants can furnish only little more than a quarter of our requirements.

Processes of nitrogen fixation: At the present time there are many processes differing greatly in principle for fixing atmospheric nitrogen and these processes are in various stages of development ranging from those used in commercial plants which have been producing for years to those which have been tried on only a little larger than a laboratory scale. There are three processes, however, which have been commercially utilized: the arc process, the cyanamid, and the synthetic ammonia, sometimes termed the Haber process.

The arc process: The first process to be utilized commercially was the arc process, still the simplest and most direct one.

In this process the nitrogen and the oxygen, both present in the air, are combined to form nitric oxide by being heated together to a high temperature by means of an electric arc. After quick cooling the gases contain a small percentage of nitric oxide which, on further cooling, combines with additional oxygen of the air, to form nitrogen dioxide. This nitrogen dioxide is then passed through large towers over which water or weak acid is trickling, and combining with more oxygen from the air is absorbed by the water forming dilute nitric acid.

There are several types of arc furnaces used but these differ only in mechanical and electrical construction, the principle of all being very much the same.

It will be noted that the only raw materials used in this process are air and water. The power requirements, however, are so large, about 67,000 kilowatt hours per ton of nitrogen fixed, that this process can be used in its present state of development only where very cheap water power is available. For this reason this process has not been as extensively used as either the cyanamid or direct synthetic ammonia process. Its principal development has been in Scandinavia, although comparatively small scale plants have been built in other countries. At present less than 10 per cent of the world's supply of nitrogen fixed from the air comes from plants using the arc process.

The cyanamid process: The next process, the commercial development of which started almost at the same time as that of the arc process, is the cyanamid process.

In this process burned lime and coke are combined in the intense heat of the electric furnace to form calcium carbide. This carbide, after cooling, is finely ground, placed in closed ovens in an atmosphere of pure nitrogen, obtaining by the fractional distillation of liquid air, and heated to a yellow heat. The nitrogen combines with the carbide to form calcium cyanamid. The crude calcium cyanamid is again finely ground and any carbide remaining, destroyed by treating with water.

Details especially of the equipment used in the several steps of the cyanamid process differ considerably in the different plants throughout the world but the essential principles are the same in all.

This process requires air, water, limestone, coke, and coal as its principal raw materials. Its electric power requirements, about 15,000 kilowatt hours per ton of nitrogen fixed, are so much less than those of the arc process that it is not nearly so dependent as that process on unusually cheap water power. Further, its intermediate product, the crude calcium cyanamid, is used to a considerable extent directly as a fertilizer material, even though there are limitations to its wider use. Two of its possible final products, ammonia sulphate and ammonium phosphate, are better fertilizer materials than those obtainable from the arc process.

For these reasons the cyanamid process is the most generally used of any of the fixation processes, there being more than 20 plants in 10 different countries, including the large Government plant at Muscle Shoals, Ala., now idle, and a smaller plant located in Canada but owned by an American company. At present, under normal conditions, somewhat more than a third of the world's fixed nitrogen comes from plants using the cyanamid process. There is no cyanamid plant now operating in the United States but practically all of the product of the Canadian plant is im-

ported into this country, constituting about 7 per cent of our total inorganic nitrogen supply.

This process is now in an advanced state of development.

Direct synthetic ammonia process: For some few years the arc and the cyanamid processes had the field to themselves. In 1913, however, the direct synthetic ammonia process developed by Doctor Haber was utilized on an industrial scale. In this process pure nitrogen and hydrogen, subjected to high pressure and high temperature, unite in the presence of a catalyst to form ammonia.

The nitrogen can be obtained from the fractional distillation of liquid air, and the hydrogen from the electrolytic decomposition of water. Ordinarily, however, this mixture of the two gases can be more cheaply prepared by the Bosch process utilizing a mixture of water gas and producer gas.

This process varies very considerably in the different plants in which it is used, the differences being principally in the method of preparing the nitrogen-hydrogen mixture and in the special catalyst and the pressure used for the ammonia synthesis. For instance, the Claude process is based upon an operating pressure of approximately 1,000 atmospheres; the Haber process is based upon an operating pressure of approximately 200 atmospheres; the General Chemical Co. process is based upon an operating pressure of approximately 100 atmospheres. The Casale process is apparently based upon an operating pressure of 300 atmospheres. It makes use of electrolytic hydrogen.

The direct synthetic ammonia process requires air, water, and coke, as well as certain chemicals, as its raw materials. Its power requirements, provided the Bosch process is used for obtaining the nitrogen-hydrogen mixture, are much lower than even those of the cyanamid process, being only about 4,000 kilowatt hours per ton of nitrogen fixed. If hydrogen is obtained by the electrolysis of water, the power requirements are approximately 18,000 kilowatt hours per ton of nitrogen fixed, or one-third more than in the case of the cyanamid process. The engineering difficulties in safely handling these gases at high temperatures and pressures are very considerable, and in its present state of development a much more skilled personnel is required to operate this process than either the arc or the cyanamid processes.

The synthetic ammonia process has been developed almost entirely in Germany, and during the latter stages of the war was the most important source of her nitrogen supply. It was not until the last year, 1921, when at Syracuse, N. Y., the first plant of any size outside of Germany using this process came into regular production. Though the Government had built a synthetic plant at Sheffield, Ala., during the war, it had not come into regular operation before the end of hostilities, when it was shut down. Experimental plants with only a very small production have been operated in France and Italy, and a commercial plant is now under construction in England. But the German plants up to this time have supplied all of the nitrogen fixed by this process, and their capacity is so great that in a normal year they furnish more than half of the world's supply of fixed air nitrogen. The plant at Syracuse, N. Y., has only about one-hundredth of their capacity and can supply less than 2 per cent of the total inorganic nitrogen requirements of the United States.

3. **Prices of nitrogen:** During the last few decades, in which the consumption of nitrogen has increased so tremendously, there has been no pronounced price trend, either up or down. There have been marked variations from year to year, but the average price over a period of years has varied but little. It is believed that the reason for this has been the stabilizing effect of the elastic supply of Chilean nitrate, which in the past has set and still sets the price for the other sources of inorganic nitrogen.

The cost of the nitrogen recovered as a by-product in the coke ovens is largely a matter of bookkeeping, and the coke ovens will make and sell their nitrogen for whatever it will bring, keeping their price low enough to insure a demand for their entire output. For this reason a country's requirements will first be supplied from this source. The requirements in excess of this supply will, generally speaking, be filled by the fixation plants as far as their capacity permits, and providing that they can meet the selling prices of Chilean nitrate. Any deficiency in the supply still remaining will be met by importing sufficient Chilean nitrate. There are exceptions, of course, to this general rule, as certain uses require particular forms of nitrogen best supplied from one particular source, but, broadly speaking, Chilean nitrate supplies the last portion of the demand, and for this reason, in accordance with usual economic experience, it fixes the price for the other two sources.

The price of Chilean nitrate tends to stabilize itself over a period of years because of the flexibility of output. There has been no marked change in the last few decades in the cost of producing Chilean nitrate, since increased efficiency of operation has been offset by rising labor costs and by the fact that the richer deposits are becoming exhausted.

The following tables give the costs of Chilean nitrate and of by-product coke-oven ammonia in the form of ammonium sulphate over a period of years, and estimated costs of fixing nitrogen in the form of ammonia or its equivalent by various fixation processes. These latter estimates are the work of the Ordnance Department and while, they have been worked out as carefully as possible, it must be appreciated that they are not based upon actual commercial operating experience and may, therefore, be somewhat in error. In comparing prices, it should be remembered that fixed nitrogen in usable form is the all important consideration. And inasmuch as the various substances do not contain the same percentages of fixed and usable nitrogen, it is necessary to convert them to the same standard, which is believed to be a ton of nitrogen.

Average yearly prices (wholesale) for principal inorganic nitrogen materials used in fertilizers.

Year.	Price of material.			Price per ton of nitrogen in material.		
	Nitrate of soda per 100 pounds.	Sulphate of ammonia per 100 pounds.	Cyanamide per unit of ammonia.	In nitrate of soda (15.6 per cent nitrogen).	In sulphate of ammonia (20.6 per cent nitrogen).	In cyanamide (18 per cent nitrogen).

¹ Data not readily available.

² For first nine months only.

Figures for sulphate of ammonia for 1900-1906 are from Coal Gas Residuals, by Fred H. Wagner.

Figures for nitrate of soda for 1906-1912 and for sulphate of ammonia for 1907-1912 are from Federal Trade Commission Report on Fertilizer Industry, and are, respectively, prices in New York and at plant.

Figures for all materials for 1913-1918 are from War Industries Board Price Bulletin No. 48, Prices of Fertilizers, and are New York prices for nitrate and sulphate and Niagara Falls prices for cyanamid.

Figures for 1919-1921 are from Oil, Paint, and Drug Reporter, and are for nitrate of soda price in New York, and for sulphate of ammonia price at plant except when in 1919 and 1920 there were no price quotations at plants and export prices were used.

Figures include export tax by Chilean Government on nitrate of soda amounting to \$11.39 per short ton.

Senator McKINLEY. Will these figures that you have there give us, so that the layman will understand, the comparative cost of making sulphate of ammonia down there as compared with the cost of Chilean nitrate?

Major BURNS. Yes, sir. I am going to give you that later. I will summarize it.

Senator McKINLEY. It will be in the record?

Major BURNS. Yes, sir.

Senator McKINLEY. So that we can read there and show that Chilean nitrate will cost \$50 a ton and that the same product worked out down there will cost \$40 a ton, or whatever it is?

Major BURNS. I will read it to you, Senator, and if it does not supply you with the desired information, I will change it so that you will be satisfied.

4. Conclusions as to cost of fixing nitrogen in competition with ammonium sulphate and Chilean nitrate: In comparing the cost of nitrogen by the fixation processes with

the costs of nitrogen in nitrate of soda and ammonium sulphate, it should be remembered that it costs some \$60 to \$80 per ton of nitrogen to convert it from the form of ammonia into the form of ammonium sulphate.

In other words, after you get ammonia, in order to make it available for fertilizer you have to combine it with something, and that combination costs you some \$60 to \$80 per ton of nitrogen. And ammonium sulphate is to-day the only developed and operating commercial method of making ammonia available in fertilizers. In addition there must be added interest charges on the operating capital required to produce the material and to carry it until it is paid for. This capital amounts to about one year's product, and interest would amount to some \$15 per ton of nitrogen.

The maximum average yearly price per ton of nitrogen during the period 1900 to 1914, inclusive, from either nitrate of soda or sulphate of ammonia is \$313. The minimum average yearly price is \$256. The average yearly price per ton of nitrogen in both nitrate of soda and sulphate of ammonia over the above period is \$283 per ton. The price has held very steady during this entire period, as can be seen from the table. To-day's price is about \$281 per ton, as against the pre-war average of \$283 per ton.

A study of the ability of the three processes of nitrogen fixation or the cyanamid, the Haber-Bosch, and the Haber electrolytic, indicates as follows:

The cyanamid process with 1-mill power could produce ammonium sulphate at a cost of some \$291.10 per ton of nitrogen as compared with the 1900 to 1914 average price of \$283. In other words, such a plant could not break even on 1-mill power. It could hardly live if power cost nothing. The Haber-Bosch process with 1-mill power could produce ammonium sulphate at a cost of \$302.15 per ton of nitrogen as compared with the 1900-1914 average of \$283. It could not break even in the fertilizer field if power cost nothing. Both might live in the anhydrous ammonia market, where the price of nitrogen is higher.

The Haber electrolytic process with 1-mill power could produce ammonium sulphate at a cost of \$246.02 per ton of nitrogen, or \$37 less than 1900-1914 average. On a basis of 2-mill power the cost would be \$264 per ton of nitrogen, or \$17 less than 1900-1914 average. On basis of 3-mill power the cost would be \$281, or \$2 less than 1900-1914 average.

It seems fair to conclude from the above that, with present knowledge, the cyanamid process and the Haber-Bosch process can not be expected to reduce the price of ammonia nitrogen in fertilizer if used in form of ammonium sulphate. In fact, they could not break even with power at the very low cost of 1-mill per kilowatt hour. The Haber electrolytic process can produce nitrogen in the form of ammonium sulphate at a price about equal to the 1900-1914 average with power at three mills per kilowatt hour. With every reduction of one mill per kilowatt hour in power (other things remaining equal) the margin would be increased by \$18 per ton of nitrogen, or about 6.3 per cent of the average pre-war selling price.

If phosphoric acid could be produced sufficiently cheaply to compete with acid phosphate and such phosphoric acid were combined with the ammonia, all the processes could compete with Chilean sodium nitrate and in fact develop quite a saving in the cost of nitrogen to the farmer. On the basis of 1-mill power the cyanamid process reduce the price of nitrogen by \$42 per ton or some 14 per cent. This results from the elimination of the cost of sulphuric acid—taken at \$50 per ton of nitrogen. With 3-mill power this reduction would be \$12 per ton, or 4 per cent. On basis of 1-mill power Haber-Bosch process could reduce price of nitrogen by \$30.85 or 11 per cent. With 3-mill power reduction would be \$17.25 or 6 per cent. On basis of 1-mill power Haber electrolytic process could reduce price of nitrogen by \$87 per ton or 31 per cent. On basis of 3-mill power reductions would be \$51 or 18 per cent.

The CHAIRMAN. That depends on something. What is that condition?

Major BURNS. That condition is cheap phosphoric acid. As a matter of fact, the crux of the whole fertilizer possibility of Muscle Shoals hinges not so much on nitrogen as it does on phosphoric acid. If this process spoken about to you by Mr. Swann and Doctor Whitney, namely, production of cheap phosphoric acid by electric-furnace methods, could be developed as a real commercial proposition for the fertilizer trade, then Muscle Shoals has quite material possibilities in the way of reducing the price of fertilizer.

The CHAIRMAN. That is something yet undeveloped.

Major BURNS. Yes; that is something undeveloped, but, as you will recall. Mr. Swann—

The CHAIRMAN. As I understand it, they have a strong probability that it can be developed.

Major BURNS. That is correct, but it is not yet a proven thing.

The CHAIRMAN. No; not yet demonstrated.

Major BURNS. That is correct.

The CHAIRMAN. All right.

Senator McKINLEY. These figures just kind of confuse. Don't you give in some place what your power will cost?

Major BURNS. I will give that later on, and will tie that in so that you will see it.

Senator McKINLEY. You might just as well say one-half cent. You are not going to get any for that.

Major BURNS. When we get to the power end we will show that on the basis of 4 mills for primary power, 2 mills for the cream of secondary, and 1 mill for the short time secondary, the No. 2 dam is an excellent power proposition. You will have to use your judgment as to what kind of power will be used and what you will charge for it. I believe, myself, that some 90 per cent of the work can be done with secondary power and that the balance should be provided for with primary power. I think a fair average charge would be 2 mills per kilowatt hour.

III. Navigation possibilities of the Tennessee River (data from testimony of Colonel Barden). The following framework is followed:

1. General description of Tennessee River.

2. Navigation facilities (a) French Broad and Holston Rivers; (b) Tennessee from Knoxville to Chattanooga; (c) Tennessee from Chattanooga to Hales Bar; (d) Tennessee from Hales Bar to Browns Island; (e) Tennessee, Muscle Shoals section; (f) Tennessee, Florence to mouth.

3. Cost of development of navigation over Muscle Shoals section.

4. Conclusions as to development of navigation over Muscle Shoals section.

1. General description of Tennessee River: The Tennessee River is formed by the junction at a point about 4½ miles above Knoxville, Tenn., of the French Broad River, rising in western North Carolina, and the Holston River, rising in southwestern Virginia. The Tennessee flows southwest across the eastern part of the State of Tennessee into northern Alabama, thence generally westward to the northwest corner of the State, where for a short distance it forms the boundary between Mississippi and Alabama, and thence north across Tennessee and Kentucky to the Ohio at Paducah, at a point about 44 miles from where the latter empties into the Mississippi River. The total length of the Tennessee is 652 miles. It is 184 miles from Knoxville to Chattanooga, 208 miles from Chattanooga to Florence, and 256.5 miles from Florence to Paducah. The total drainage area is 40,570 square miles, and the low-water discharge at the mouth is about the same as that of the Ohio at the junction of the two rivers.

2. Navigation facilities: The navigation facilities will be summarized under various stretches of the river.

(a) French Broad and Holston Rivers: These are navigable streams over a large portion of their lengths.

(b) Tennessee River from Knoxville to Chattanooga, 184 miles: The river is navigable throughout the year for light draft traffic.

(c) Tennessee River from Chattanooga to Hales Bar, 33 miles: Six-foot navigation has been developed between Chattanooga and Hales Bar by means of the Hales Bar power and navigation dam which is now installed. The construction was by private capital, except that the gates, valves, and operating machinery of the lock were provided by the United States at a cost of \$236,388. The total cost of the dam and equipment amounted to some \$11,000,000. The dam has an installed capacity of 45,000 horsepower.

(d) Tennessee River from Hales Bar to Browns Island, 138 miles: The present project calls for two low dams with lifts of some 8 feet, one at Widows Bar and the other at Bellefonte Island. This construction will extend 6-foot navigation from Hales Bar down to Bellefonte Island, 39 miles. The Widows Bar Lock has been started, but preliminary work only has been done at Bellefonte Island.

Three additional locks and dams have been recommended in order to secure 6-foot navigation between Bellefonte Island and the Muscle Shoals section. These have not been authorized and the present project calls for open-channel work only to secure a 5-foot channel.

The actual conditions over this entire distance allow of light-draft navigation only throughout the greater part of the year. It amounts to 3 to 4 foot draft for six months, with lesser drafts during the remainder of the year.

(e) Tennessee River, Muscle Shoals section, or Browns Island to Florence, 37 miles: The shoals in this section (Elk River, Big Muscle, and Little Muscle) are caused by hard flinty rock strata which have caused the river to widen out in places to nearly 2 miles. The total fall in the 37 miles is 134 feet. Without improvement over this section upstream navigation was never possible. Downstream navigation was occasionally attempted by rafts and light vessels, but always with great risk.

In 1875 work was commenced on the present canal, which consists of two sections, one on the north bank, 14½ miles long, with a lift of 85 feet in nine locks, overcoming Big Muscle Shoals, and one on the south bank, 2½ miles long, with a lift of 17 feet in two locks, at the Elk River Shoals. The two sections are 8 miles apart. The work was completed in 1890 at a total cost of \$3,191,726.50. The original project called for another section of canal to overcome Little Muscle Shoals, and carry the improvement to Florence, but this was changed to provide for open-channel work.

The canal proper gives 5 feet navigation, but, owing to deficient depth in the river between the two sections and below the lower section to Florence, the minimum available depth throughout the year is less than 2 feet; 3 feet are available about six months and 4 to 5 feet are available for a shorter period.

Navigation is now entirely blocked by the incomplete Wilson Dam.

(f) Tennessee River, Florence to mouth, 257 miles: The present project calls for a channel 6 feet deep at ordinary low water, and 5 feet deep at extreme low water, to be secured by open-channel methods, except at Colvert and Bee Tree Shoals. To pass by these shoals a lateral canal 8 miles long with one lock is provided. The canal is completed and the open-channel work about 80 per cent complete. Four-foot navigation is usually available from Florence to the mouth throughout the year, and 6-foot navigation for about 8 months.

3. Cost of development of navigation over Muscle Shoals section: The combination of steep slope, high banks, and the great volume of water in the Muscle Shoals section of the river make it a favorable location for a large power dam or dams. This fact has long been recognized and for many years the dream of a big dam in this region has been taking shape. Numerous examinations and surveys have been made under congressional authorization with a view to securing development of water power in connection with improvement of navigation through joint action of private agencies and the Government. A report favorable to development along these lines was finally made by the Corps of Engineers some six or eight years ago. In view of the national defense act of 1916, however, the proposed contract with private interests for joint project was abandoned.

The consensus of opinion at the present time seems to indicate that navigation and power development in the Muscle Shoals section could best be accomplished by the construction of three dams.

The No. 1 Dam would be located just above the Florence Bridge and would consist of a lock and low dam connecting Pattons Island, in the Tennessee River to the north shore of the Tennessee. Pattons Island, which extends upstream some 2 miles, would be connected with the locks of the No. 2 Dam, so that in reality there would be a canal from the No. 2 Dam to the No. 1 Dam. This No. 1 Dam is for navigation purposes only and would not supply any power. The estimated cost of the No. 1 Dam is \$1,400,000.

The No. 2 Dam, now officially designated the Wilson Dam, is located about 3 miles upstream from the site of the proposed No. 1 Dam. This No. 2 Dam would raise the water approximately 95 feet and would give in excess of 6 feet navigation to the proposed site of the No. 3 Dam, a distance of some 15 miles.

The proposed No. 3 Dam would raise the water some 40 feet and would give a minimum of 6 feet navigation a further distance upstream of approximately 65 miles.

These three dams would, therefore, give a minimum of 6 feet navigation over a distance of some 83 miles.

There is considerable doubt as to what cost should be set aside for navigation improvements, in the construction of these dams. The estimated cost of the No. 1 Dam, or \$1,400,000, should apparently be charged in toto to navigation. Assuming that the other two dams, or Nos. 2 and 3, are to be built for the development of power only, the cost of providing navigation would be merely the excess cost of putting in locks over that of a solid section of the dam. The approximate cost of this would be \$2,860,000 for Dam No. 2 and \$1,425,000 for Dam No. 3, or \$4,285,000 for both dams.

Assuming that the two dams, or Nos. 2 and 3, are not built for the development of power, the cheapest way in which navigation could be provided over this stretch of river would be by—

(a) Dredging the river and constructing low dams or dikes in the river above the upper section of the present Muscle Shoals Canal.

(b) The construction of a low dam across the river at Lock No. 1 of the lower section of the present canal to provide sufficient depth in the 8 miles of open water between the two sections.

(c) The construction of a lock at the site of Dam No. 2, or the Wilson Dam, with low dams connecting the island across to the south bank to submerge the rapids at Little Muscle Shoals, and thus provide access to Lock No. 9 (the lowest lock) of the lower section of the existing canal.

All of this work would be for the purpose of completing and making effective the present Muscle Shoals Canal, which can not now be used to full advantage on account of deficient depth of the river above the upper section, between the two sections, and below the lower sections thereof. The cost would be approximately \$8,600,000, to which should be added the cost of No. 1 Dam, or \$1,400,000, making a total of \$10,000,000. This construction would provide only for 5-foot depth of channel, and this channel would be narrow and somewhat difficult of navigation. It would, of course, be far less suitable for the development of navigation than that which would be provided by the two high power dams now under consideration.

To provide a 6-foot channel over this stretch of river the present canal would have to be reconstructed and work done in the river above and below and between its two sections similar to that described in the preceding paragraph, but on a more extensive scale. The estimated cost of this work would be approximately \$25,786,000, to which should be added the cost of the No. 1 Dam, \$1,400,000, making a total of \$27,186,000. This estimate is based upon plans contained in a survey report by Major Harts, Corps of Engineers, under date of March 21, 1910, and may be assumed as representing the best and cheapest method of providing for 6-foot navigation over this 80 miles of river if no attention were paid to the development of power.

The value to navigation of the power dams, or Nos. 2 and 3, should be considered, therefore, as being not in excess of \$25,786,000 and not less than the additional cost of putting locks in the two dams, or \$4,285,000. The more logical minimum factor would seem to be the \$8,600,000 which would be required to provide a 5-foot depth of channel.

4. Conclusions as to development of navigation over Muscle Shoals section: The Government has apparently definitely adopted the policy of developing the Tennessee River for navigation as it has been appropriating money year after year for such purpose. The question as to whether some development of navigation is worth while seems, therefore, to have been answered. Considerable progress seems to have been achieved in certain regions, although in others the work done at considerable expense has been wasted. This is apparently because the open channel method employed in some stretches has not been of lasting value. The experience seems to indicate that permanent improvements to navigation can only be achieved by permanent locks, dams, and canals.

The Muscle Shoals section, which is located less than half way up the navigable stretch of the river, is practically the first and the most serious obstacle to navigation. To develop satisfactory and permanent navigation it is necessary, therefore, to erect permanent works to care for the Muscle Shoals section. This can apparently be done with maximum benefit and minimum expense to the country through a combination of navigation and water-power development.

The completion of the No. 2, or Wilson Dam, would eliminate the definite obstacle that now exists due to the partly finished dam, and would provide a minimum of 6-foot navigation over some 15 miles of river. The additional expense required to complete this dam could be justified even though no part of it were charged to navigation.

The No. 3 Dam would extend 6-foot navigation from the head of the pool formed by the No. 2 Dam for an additional distance of some 65 miles. This dam could not pay for itself as a power proposition unless some six to eight million dollars were charged off to navigation.

To install the navigation features of these two dams would cost \$4,285,000 (\$2,860,000 for Dam No. 2 and \$1,425,000 for Dam No. 3). To create 5-foot navigation over the region included by the pools of these dams would cost over \$8,600,000. To create 6-foot navigation over the same region would cost some \$26,000,000.

It would seem, therefore, that the logical minimum factor to be charged to navigation in these two dams would be \$8,600,000.

To connect the No. 2 Dam with the downstream navigation would require a small additional dam (No. 1) for navigational purposes only, the cost of which would be about \$1,400,000.

As to whether development of navigation at the present time over the Muscle Shoals region is worth the expenditure of some \$10,000,000 is open to very serious doubt.

IV. *Power possibilities of Muscle Shoals.*—The following framework is followed:

1. General statement.
2. Power available (a) Dam No. 2, or Wilson Dam; (b) Dam No. 3; (c) steam plant at nitrate plant No. 2.
3. Possibilities of increasing primary power by storage dams in upper waters of Tennessee or other rivers.
4. Probable power market.

5. Relationship of Muscle Shoals power to the general supply of power in the regions adjacent to Muscle Shoals.

6. Cost and time required to complete Dam No. 2 and to construct Dam No. 3.

7. Probable value of Muscle Shoals power developments.

8. Conclusions.

1. General statement: The power possibilities of Muscle Shoals are centered in Dam No. 2, or Wilson Dam, Dam No. 3, and the auxiliary steam plant located at United States nitrate plant No. 2. The flow of the Tennessee is very irregular and varies from a minimum flow of some 8-10,000 second-feet to a normal maximum of some 150,000 second-feet and a flood maximum of 440,000 second-feet. If the flood waters could be held back by storage dams or otherwise and the flow at Muscle Shoals made of a more uniform character, the amount of primary power could be correspondingly increased. For this reason storage reservoirs in the upper branches of the Tennessee have a very important bearing upon the power possibilities of Muscle Shoals.

The steam plant at Gorgas on the Warrior River is not included as part of the Muscle Shoals power as it is believed the Government should sell its interests in this plant to the Alabama Power Co.

Nor is the power plant at United States nitrate plant No. 1 included as this has a capacity of only 5,000 kilowatts and is too small to affect the situation appreciably. Furthermore, its power would be quite expensive.

2. Power available at Muscle Shoals—(a) Dam No. 2:

Horsepower available.	Per cent of time available.	Months available.	Horsepower available.	Per cent of time available.	Months available.
87,380.....	99.4	12	306,000.....	50.0	6
100,000.....	97.0	12	600,000.....	20.0	2½
141,000.....	83.3	10	1,100,000.....	7.0	1
205,000.....	66½	8			

¹ Practically.

(b) Dam No. 3: Dam No. 3 can produce approximately 40 per cent as much power as Dam No. 2.

Power available in terms of kilowatt hours: In terms of kilowatt hours, Colonel Barden submitted the following table as the probable output of Dams Nos. 2 and 3:

Probable power output, Muscle Shoals, Ala., based on 49-year stream-flow record.

Class of power.	Horse-power.	Kilo-watts.	Kilowatt-hours per year.		
			100 per cent.	80 per cent.	60 per cent.

¹ Limit.

(c) Steam plant at nitrate plant No. 2: This plant has an installed generating capacity of 60,000 kilowatts or 80,000-horsepower. It has sufficient steam capacity for about 75,000 kilowatts, or 100,000-horsepower. The power house has a place provided for an additional 30,000-kilowatt generator, and water arrangements are sufficient for a total installation of 90,000 kilowatts or 120,000-horsepower. Some additional boilers and housing therefor would have to be provided for the 120,000-horsepower installation.

The CHAIRMAN. There is a possibility of 120,000-horsepower from that steam plant?

Major BURNS. Yes, sir, in accordance with the present lay-out.

The CHAIRMAN. By the installation of additional equipment?

Major BURNS. By the installation of a few additional boilers and of a generating unit. The reason for this condition is that when they started the plant they expected to construct a 90,000-kilowatt plant, and they provided a water intake on that basis, and built the power house on that basis. It was there decided that only a 60,000-kilowatt plant was needed and it was completed in accordance with this latter capacity. So that it is really more than a 60,000-kilowatt plant.

The CHAIRMAN. It has a capacity, without any additional boilers, of 80,000-horsepower?

Major BURNS. Yes, sir.

3. Possibilities of increasing primary power by storage dams in upper waters of Tennessee or other rivers: Two schemes have been suggested for increasing either actual or, in effect, the primary power at Muscle Shoals. One is the construction of storage reservoirs or other means of holding back flood waters in the upper branches of the Tennessee, and the other is to create storage reservoirs on other rivers, as, for instance, the Tallapoosa, the water of which would be turned into power to supplement the secondary power at Muscle Shoals. This latter scheme requires, of course, the tie-in of Muscle Shoals power with a system using Tallapoosa power.

In the matter of storage reservoirs on the Tennessee, the district engineer at Chattanooga has just completed a preliminary survey of the possibilities thereof and it is understood that recommendation is to be made to Congress for the necessary appropriations to make the detailed survey necessary to determine just what the expectations are. The testimony before the committee is to the effect that in the Tennessee and its tributaries some 46 combined reservoir and power dams are believed to be feasible, each having a draw-down capacity varying from 5,000 to 800,000 acre-feet. The two largest with capacities of 700,000 and 800,000 acre-feet, respectively, are located on the Clinch River. The district engineer thinks that if their draw down were properly regulated in the interest of the Muscle Shoals dams the minimum flow and therefore the primary power could be about doubled in an average year.

4. Probable power market: The Alabama Power Co. has testified before the Military Affairs Committee of the House and the Senate Agricultural Committee, in effect, that it might be possible to develop a maximum load for their system by the year 1926 of some 880,000 horsepower. Their present maximum capacity is 190,000 horsepower and they have under construction the Mitchell Dam with a rated capacity of 110,000 horsepower. They also have under temporary lease the Muscle Shoals steam plant with capacity of 80,000 horsepower. On this basis their total maximum capacity is 380,000 horsepower. This would leave a deficit of some 500,000 horsepower which might be supplied by Muscle Shoals hydroelectric power. The summary of the Alabama Power Co. in this connection follows:

General statement concerning power situation in Alabama and contiguous territory.

	Horsepower.
The present power and lighting load of Alabama Power Co. can be considered as.....	135, 000
The maximum load established in December, 1921, due to urgent needs for power in Georgia and Carolina. was.....	160, 000
With a return to normal business conditions in coal, iron, and textile industries in 1922, the power and lighting load, exclusive of requirements in Georgia and Carolina, will be.....	160, 000

Assuming 10 per cent per annum as a measure of natural growth of load due to increased use by present customers, plus new industries that will be attracted into the State by low-priced power, the load in 1926 will be.....	210, 000
There is an available power load in territory adjacent to present transmission lines of Alabama Power Co., exclusive of railway electrification, of.....	160, 000
There is a power load available to Alabama Power Co. by extension of lines to Memphis, New Orleans, Mobile, Meridian, etc., of.....	200, 000

Horsepower.

The Tennessee Power Co., the Georgia Railway & Power Co., the Columbus Power Co., the Central Georgia Power Co., in order to supplement existing plants, will absorb..... \$70,000
 Railway electrification in Alabama alone offers a potential market for..... 240,000

The total load in 1926, inclusive of present load plus prospective load, may reasonably be..... 880,000

Alabama Power Co. present generating capacity..... 190,000
 Additional generating capacity from Muscle Shoals steam plant..... 80,000
 Additional generating capacity from Mitchell Dam..... 110,000
 Total generating capacity available under present program without Muscle

Shoals in 1926 will be..... 380,000
 Deficit to be supplied by Muscle Shoals..... 500,000

The representatives of the Georgia Railway & Power Co., the Columbus Power Co., the Central Georgia Power Co., and the Tennessee Power Co., in their letter to the Chief of Engineers of May 20, 1921, stated in substance that in their estimation the demand for power in the southeastern territory would absorb an additional capacity of some 500,000,000 kilowatt hours by 1927. This quantity is approximately the primary power of the Wilson Dam. In other words, they think that the primary power of Wilson Dam can be absorbed by 1927.

Senator MCKINLEY. That is 100,000 horsepower?

Major BURNS. Yes, sir; approximately. In Colonel Kellar's report to the Secretary of War in 1921, The Power Situation During the War, it was stated that 1,000,000,000 kilowatt hours would be needed in the southern territory in from five to seven years. This would be about twice the primary power of Dam No. 2.

These estimates, together with the definite offer of the Alabama Power Co. to complete the Wilson Dam, seem to conclusively establish that a market could be found through the natural expansion in power requirement in the territory adjacent to Muscle Shoals for the primary power to be developed at the Wilson Dam upon its completion. Nor does it seem unreasonable to conclude that a ready market could be formed for the additional primary power that would be made available from the No. 3 Dam if finished within two or three years after the No. 2 Dam. In the matter of secondary power it is more difficult to come to a conclusion but it seems fair to assume that all of it of reasonable value could be marketed within some five years after the completion of each dam. And of course if special industries were established at or near Muscle Shoals to absorb the power therefrom the question of a market for power would be solved thereby.

The CHAIRMAN. It is natural to suppose, Major, that if it were known now that Dams Nos. 2 and 3 were going to be constructed within the time estimated, by the Army engineers, that of itself would have a tendency to cause people who wanted power to investigate the subject and perhaps locate in the vicinity?

Major BURNS. Yes, sir. And of course that is a very important point in the handling of this power problem. The policy with reference to the distribution of power will have to be known two or three years before the power becomes available, so that the market can be created.

The CHAIRMAN. Yes.

Major BURNS. Otherwise you may have the dams there with power available and no market.

The CHAIRMAN. If we had it all there now we could not sell it.

Major BURNS. No, sir.

The CHAIRMAN. If we knew to-morrow that we were going ahead to construct these two dams, or somebody was, it would have a tendency to cause various kinds of industry to look into the subject with a view to building and getting ready to use the power by the time it was ready to deliver.

Major BURNS. Yes, sir. I think that is an important point to keep in mind.

The CHAIRMAN. There are some industries that would realize that we would have there a great deal of secondary power that would be sold very cheap.

Major BURNS. Yes, sir.

The CHAIRMAN. Men who are in business that could use secondary power would very naturally commence to investigate if they knew that within two or three years there was going to be that supply, I should think.

Major BURNS. Yes, sir. You are correct.

5. Relationship of Muscle Shoals power to the general supply of power in the region adjacent to Muscle Shoals: The Alabama Power Co. has stated before the Military Affairs Committee of the House: "It (Muscle Shoals) is, of course, the largest water power in the South, and without it the developments which exist in this immediate territory are not sufficient to supply these markets in the States of Mississippi and Louisiana, and even as far away as Memphis. * * * When we reach the end of the Appalachian Chain in the State of Alabama there is no water power after you pass Alabama until you get beyond the Mississippi River, hundreds of miles away. That whole development of water power in Alabama, then, is the last, and the last opportunity the public will have south and southwest to obtain hydropower. If withdrawn from the public service, there is no opportunity for them ever to obtain hydropower". It pointed out that within a radius of 150 miles are located Memphis and Jackson, Tenn., which have no hydropower; Nashville and Columbia, Tenn., which could have additional hydropower; and also Meridian, Miss. Within 200 miles are Little Rock and Vicksburg which have no hydropower. Within 300 miles are Natchez and Mobile which have no hydropower. Within 350 miles are New Orleans, Baton Rouge, and Pensacola, and within 400 miles the City of Shreveport, none of which have hydropower. The Chief of Engineers stated before the Military Affairs Committee of the House that the Alabama Power Co. is "sending power at a voltage of about 110,000 volts to a distance of 250 miles." He also states: "There have been claims made by people engaged in electrical transmission of power that they are perfecting that work so that they can transmit power as economically, or will be able soon to transmit power, to a distance of 400 miles as economically as they do at present to a distance of 200 miles". He also stated that, by a system of relaying power, it is now being made available at a distance of 600 miles.

I mention that to show that all of these places that are mentioned are within transmission distance of Muscle Shoals.

The CHAIRMAN. You are quoting somebody else. What is your idea about that, Major?

Major BURNS. I think that is correct.

The CHAIRMAN. You agree with that?

Major BURNS. Yes, sir; absolutely.

Senator McKINLEY. Major, are they not delivering power 275 miles in California now?

Major BURNS. I think they go a little further than that. I have seen it stated that they are delivering it at 400 miles in California.

The CHAIRMAN. They are constantly improving methods of transmission of electric energy.

Major BURNS. Yes, sir. They are increasing the voltage and reducing the wastage of current and cost of transmitting. And then they have the relay system which has just come into use which is exceedingly important because due to one company helping another out, they are able in effect to make delivery of power much further than by direct transmission.

The CHAIRMAN. I will ask you now in your judgment if the development of power at Muscle Shoals could be economically carried to New Orleans, Little Rock, Ark., and the other places you have mentioned.

Major BURNS. Yes, sir.

Other witnesses before the Senate committee have contended that it would not be to the greatest benefit of the greatest number if Muscle Shoals were utilized only in furnishing power to such industries as would be developed in the immediate vicinity of Muscle Shoals. Conversely they have contended that the maximum benefit to the greatest number would be obtained if Muscle Shoals power were made available for interconnection with the other power systems surrounding Muscle Shoals. Colonel Keller of the Corps of Engineers in his report to the Secretary of War in 1921, entitled "The Power Situation During the War," in which he reviewed the power situation, stated as follows in respect to Muscle Shoals:

"150. It appears, therefore, that a broad and well-founded judgment would dictate that the Muscle Shoals development should be interconnected for exchange of power with the existing power systems of the Southern States and that this interconnection and exchange should be arranged for without delay so that future construction both at Muscle Shoals and elsewhere can be directed for the production of plants which will supplement each other for economy of construction and operation."

In this connection it should be noted that the various rivers in Tennessee, the Carolinas, Georgia, and Alabama, which are now furnishing hydroelectric power do not have their minimum flow at the same time. As a consequence, if interconnected, (and they are interconnected at present) they can be used to supplement each other to a certain extent.

On the other hand it has been contended by other witnesses that the products of power are distributed over a greater area than is power itself, and that, therefore, a concentration of industry at Muscle Shoals would not be second in benefit to the general community to a general distribution of the power from Muscle Shoals.

This latter argument might have weight if the manufacturers were forced to limit profits in their products in accordance with the cost of power in the same way that public utility corporations are required, through public service commission control, to limit their profits on power.

The CHAIRMAN. Right in that connection, those who contend that all of the power ought to be used right at Muscle Shoals, like Mr. Ford proposes to use it, for instance, and thereby cheap manufactured products be made there, and they be shipped instead of the power transmitted, lose sight of the fact, do they not, that under Mr. Ford's offer, or anyone else's who is going to concentrate it all there and have it absolutely without regulation, would not have their products regulated as to price by any commission or any governmental authority, and they could ship it anywhere they please and sell it at any price they please, whereas if the energy is transmitted it is always under the supervision either of the State or the Federal Government that regulates the rates that they can charge to the consumer.

Major BURNS. Yes, sir. I think that point has been overlooked in their argument.

The CHAIRMAN. And the man who manufactures a completed product at Muscle Shoals, or anywhere else, and gets the benefit of cheap power, when he comes in competition with somebody else in some other locality, who manufactures by power that is not as cheap, all he does—and I say it without criticism; I would do the same myself if I had it—is to sell his completed product at a price that will find a market. He undersells the fellow who has no such cheap power only enough to make the sale and pockets the balance.

Major BURNS. That is correct. He governs his business by the ordinary rule of supply and demand.

The CHAIRMAN. Yes, certainly. He sells it for all he can get for it. Therefore, the result is if the Government in any substantial way assists a man to develop this power or gives it to him without regulation, it gives to some manufacturer an advantage over his competitors in the commercial world.

Major BURNS. Yes, sir.

This question as to how to best protect the interest of the greatest number of people in the matter of utilizing the power at Muscle Shoals is unquestionably the most important one in connection with the whole Muscle Shoals project. Four general schemes have been expressed before the Senate Committee as to the best method of utilizing the Muscle Shoals power:

First. Lease or sale of Muscle Shoals power project for 100 years with no control by Government over method of using such power or the rates at which it shall be used unless it should happen to come under State or Federal regulation of public utilities, with the exception, however, that an unknown and not stipulated quantity of power shall be used in the manufacture of fertilizer.

Second. Complete retention of control by Government through governmental construction and operation.

Third. Administration of Muscle Shoals power project in conformity with the national policy on water power development as outlined in the Federal water power bill. In this instance the power project would be completed by private capital under license from Federal Power Commission and such license would guarantee governmental control of the project and allow Government to recapture at end of fifty years.

Fourth. Partnership between the Government and private capital by which each supplies a part of the capital and shares in profits or losses. Operation is by private capital methods under control by directors appointed by each party. In addition the general control system of the Government would apply.

6. Cost and time required to complete Dam No. 2 and to construct Dam No. 3: Various estimates have been submitted as to the probable costs of completing these dams. In the memorandum by the Chief of Engineers accompanying the Secretary of War's letter to Congress forwarding the Ford offer it is stated, as follows:

"The Engineer Department's estimate made in July, 1921, for completing Dam No. 2 with its full power equipment is in round numbers \$28,000,000, and in August, 1921, for constructing Dam No. 3, \$28,000,000.

"The estimate of Mr. Ford's engineers for completing Dam No. 2 is in round numbers \$23,230,000; for Dam No. 3, \$19,000,000.

"Construction of Dam No. 2 has so far advanced that foundation conditions are thoroughly established, and the work required can be predicted with certainty, leaving as the only uncertainty the cost of executing the work. The condition does

not exist at Dam No. 3, where the foundation work necessary will not be certainly determined until the bed of the river is laid bare. The Engineer Department's estimates are regarded as adequate to meet any reasonable eventuality of construction at the costs current when the estimates were prepared.

"Subsequent to the preparation of the Engineer Department's estimates the prices of material and labor have generally declined, and it is believed that a reduction of about 10 per cent in the prior estimates is now justifiable. The cost of completing the two dams with power equipment for purposes of this analysis is therefore taken at \$25,000,000 each, in round numbers, or \$50,000,000 in all.

"The time of completion of Dam No. 2 has been placed at 40 months, of No. 3 at 36 months. Considering, however, the fact that the hydroelectric machinery for the first 100,000 horsepower of No. 2 is already under contract, and that the first units can be put in operation prior to the eventual completion of the entire installation, it is considered that, for purposes of analysis, the time before payments begin to accrue may be placed at three years for each dam."

The above figures and in fact no figures used except where specifically indicated include costs of flowage rights for Dam No. 3 which are estimated to total \$2,331,000.

Colonel Barden's estimates for completing the work of providing draft tubes, excavation, and power-house substructure for the total number of units contemplated but actually installing at the present time only four units, amounts in the case of Dam No. 2 to \$20,849,000. If eight units were installed the corresponding cost would be \$23,177,000. And if the entire eighteen units were installed the cost would be \$28,500,000. The Alabama Power Co. estimates that it could complete the dam and install eight units for \$18,854,000 (that is, four and a half million dollars less than Colonel Barden estimates) and that they could install 18 units for \$26,354,000 (that is, about \$2,000,000 less than Colonel Barden estimates).

Colonel Barden estimates that it will cost \$25,000,000 to complete Dam No. 3. No. 3 dam is a lower dam than No. 2, having a lift of about 40 feet as compared with a lift of 97 feet in No. 2. No. 3 would be some 6,700 feet long as compared to 4,500 feet for No. 2.

Colonel Barden estimates it will take some three years to complete Dam No. 2, and emphasizes the necessity of three low-water periods. He also estimates it would take some three years to construct Dam No. 3, and states that the most economical construction of Dam No. 3 would depend upon the use of the same construction plant that is now used for the construction of No. 2. In other words, under such arrangement No. 3 Dam would not be completed for six years.

Some question has been raised as to the probability of leaks through seams in the river bed or on sides of river. Both the Corps of Engineers and Col. H. L. Cooper believe no serious trouble need be feared so far as No. 2 Dam is concerned.

The Corps of Engineers has made some borings at the site of Dam No. 3, but states in effect that it has not made sufficient investigation to determine a definite plan for the foundations nor the troubles that might be encountered through cavitation, seams, etc.

The CHAIRMAN. Let me ask you there, how much money has the Government spent on Dam No. 3, in making borings?

Major BURNS. I don't know that. I will have to look that up.

The CHAIRMAN. Have you any idea as to the amount?

Major BURNS. I think it is rather small. I would guess that they did not spend in excess of \$50,000.

The CHAIRMAN. I was under the impression they had completed the borings clear across the river.

Major BURNS. They apparently are not satisfied with their borings, because I am quoting here from the letter of the Chief of Engineers, which was written two or three months ago, and he says definitely that he has not made sufficient investigation to find out what kind of foundation there is.

The CHAIRMAN. I was under the impression that they had completed them and were satisfied with the foundation. What was your idea, Senator McKinley? You were there.

Senator McKINLEY. I did not think they were satisfied.

The CHAIRMAN. I must be wrong. I was under the impression that they spent a lot more than you had estimated, Major.

Major BURNS. That was really a guess, Senator. I would have to look that up.

In this connection it is pointed out, however, that Colonel Cooper (who is employed by the Corps of Engineers as the designing engineer of the No. 2 Dam) recommended to the Senate Agricultural Committee in substance that a special committee of experienced engineers be appointed to check up designs, methods, conditions, etc., to insure that everything connected with Dam No. 2 was satisfactory.

The CHAIRMAN. I have always been under the impression that that recommendation, as I remember very distinctly that Colonel Cooper made, was made on account of perhaps an oversensitiveness on his part that somebody else ought to go over his work, not because he had any doubt about the possibility of finding anything wrong there. He seems to be well satisfied, and so do the Government engineers, as far as I am able to determine, that there is nothing wrong.

Major BURNS. That is the impression I got from both Colonel Barden's and Colonel Cooper's testimony—that they are satisfied.

The CHAIRMAN. So Colonel Cooper's wish that the Government spend a lot more money and hire a lot more of experts to go down there and examine it did not impress me very much, because it seemed to me it would cost a great deal of money to do it. to get high class people, and if there was a dispute in the end we would have to follow one doctor or the other, and I got on the idea if you hire a doctor you ought to be prepared to follow his advice, the same as you would a lawyer.

Major BURNS. I brought that out to show that there might be some doubt. However I did not get the idea that there was any doubt, but Colonel Cooper impressed me that he was willing for any kind of investigation to be made or any kind of a commission to look into it and see whether he is right or wrong.

7. Probable value of Muscle Shoals power developments—(a) General statement: It is very difficult to determine the value of the power developments. Assumptions as to the future must be made in order to give a basis on which to make calculations and there are so many variables in connection with Muscle Shoals that the making of reasonable assumptions is not any easy matter. In the effort to make reasonable assumptions discussions have been had with various power engineers who understand Muscle Shoals and the assumptions which follow are believed to be reasonably conservative.

(b) Assumptions: In making an analysis of the value of the Muscle Shoals power project, the following assumptions have been made:

(1) That the ultimate development at Dam No. 2 will be for 540,000 horsepower which has been divided, according to the period of the year during which the power will be available, into classes as follows:

Horsepower available 99.4 per cent of the time.....	87, 300
Horsepower available from 9 to 12 months.....	72, 700
Horsepower available from 7 to 9 months.....	80, 000
Horsepower available from 5 to 7 months.....	120, 000
Horsepower available from 4 to 5 months.....	90, 000
Horsepower available from 3 to 4 months.....	90, 000

Total..... 540, 000

(2) That the installation at Dam No. 2 will consist of eighteen 30,000-horsepower units, four to be installed on completion of the dam; four, one year later; four, two years later; three, three years later; and three, four years later, and that the market will develop in such a way that these units can be loaded as soon as they are ready for service.

(3) That Dam No. 3—

The CHAIRMAN. Before you take up Dam No. 3, the installation of that power is only an estimate and could be varied, of course, according to conditions?

Major BURNS. Yes, sir. That is what you would do in actual practice.

The CHAIRMAN. Yes. If you found you had a demand for power, you would put all these things in at once?

Major BURNS. Yes, sir. It would depend upon the market.

The CHAIRMAN. Exactly. If you need them you put them in, and if you don't, you wait for the market.

Major BURNS. We made these assumptions in order to show what, in our judgment, that power is worth down there.

(3) That Dam No. 3 will be equipped for 216,000 horsepower, which is 40 per cent of that at Dam No. 2; and that the market will develop in such a way as to call for the installation of one-third of the equipment when the dam is completed, one-third one year after the dam is completed, and one-third two years after completion of the dam.

(4) That the No. 2 steam electric plant will be used to its full capacity for the purpose of supplementing a part of the secondary power at Dam No. 2.

The CHAIRMAN. Have you taken the steam plant at plant No. 1 into consideration?

Major BURNS. No, sir.

The CHAIRMAN. Why haven't you done that?

Major BURNS. Because it is a small steam plant with only 5,000-kilowatt capacity.

The CHAIRMAN. How many horsepower?

Major BURNS. That would be 6,600 horsepower.

Senator McKINLEY. That is a direct-current plant, and you would have to transform it if you carried it any place.

Major BURNS. The cost of generating power from that small plant would be too high to tie into a big system.

The CHAIRMAN. I should think it could be economically used at times when there was just a little deficiency, rather than start up your big plant.

Major BURNS. Of course to do that you would have to have your stand-by crew there all the time.

The CHAIRMAN. You would have a crew at No. 2 anyway. They are close together.

Major BURNS. They are about 5 miles apart.

The CHAIRMAN. Yes.

Major BURNS. You might be able to do that, but it would have no appreciable effect upon the figures.

(5) That energy from Dam No. 2 and No. 3 can be sold at the dam on the following basis:

Primary.....	per K. W. H..	\$0.004
Secondary:		
8½ to 12 months.....	do.....	.002
5 to 7 months.....	do.....	.0015
3 to 5 months.....	do.....	.001

(6) That the load factor would be 80 per cent for Dam No. 2 during the first year and that the load factor at Dam No. 2 after the first year would be 80 per cent for the primary power and for the 9 to 12 months secondary power; that all other power from Dam No. 2 including that supplemented by the steam plant would be used at 60 per cent load factor; that the primary power and the 8½ to 12 months secondary power at Dam No. 3 will be used at 80 per cent load factor and all other power at Dam No. 3 at 60 per cent load factor.

The CHAIRMAN. Major, in making these computations you have estimated, I suppose the cost of coal in operating the steam subsidiary plants there, steam plant No. 2, at the price that it would cost now delivered on the railroad?

Major BURNS. That is correct, yes.

The CHAIRMAN. Have you ever taken into consideration the possibility or probability that when navigation was made possible by means of these dams it would be possible to transport that coal there by water and reduce the cost of the steam plant a great deal?

Major BURNS. I did not do that in these calculations, but that certainly is possible.

The CHAIRMAN. Well, is not that probable?

Major BURNS. Yes, sir; it is not only possible, but probable, and it would have the effect of reducing our coal item probably as much as at least one-fourth.

The CHAIRMAN. And then there is a further possibility I guess, a probability, that mines on the Tennessee River might be opened so that the coal could be loaded from the mines right into a barge on the Tennessee River.

Major BURNS. I thought that was what you had in mind. I understand that there are some good large coal mines in the upper branches of the Tennessee that could be reached if navigation were thoroughly developed over the Tennessee, so that coal could be barged down from the mines directly at No. 2 plant.

Senator McKINLEY. Is No. 2 on the river?

Major BURNS. Yes, sir.

Senator McKINLEY. Right on the river, is it?

Major BURNS. It is right on the river.

The CHAIRMAN. Yes. The river flows right by it there; don't you remember, Senator?

Senator McKINLEY. No; I didn't remember that.

(7) That the value of the project to navigation will be \$8,600,000 which is the estimated cost of providing 5-foot navigation over that part of the river affected by the two dams. That of this amount \$2,860,000 which is the estimated cost of the navigation features of Dam No. 2 should be credited to Dam No. 2 and the remainder, or \$5,740,000 to Dam No. 3.

(8) The rate of depreciation on the equipment and structure has been taken at 3½ per cent and one-half per cent, respectively. These figures represent the consensus of opinion on the subject and are believed to be reasonable. The figure of one-half per cent for the dam structure may seem high but due consideration has been taken of the fact that the spillway gates, which are subject to considerable depreciation, are included as part of the dam structure.

In that connection, I would like to read a letter that we got from the Reclamation Service in our efforts to ascertain what the depreciation on dams is.

WASHINGTON, June 14, 1922.

Maj. J. H. BURNS,
5747 Munitions Building, Washington, D. C.

MY DEAR MAJOR BURNS: Answering oral inquiries respecting the depreciation or maintenance cost on masonry dams, our experience has been that such cost is very low, probably so low that insufficient time has elapsed to permit any general conclusions from the structures of the Reclamation Service. Also the conditions affecting the different structures vary so that it is dangerous to draw conclusions as a guide for prediction elsewhere.

However, I am sending you herewith a copy of the latest (twentieth) annual report, in which will be found some information along this line. For example, in the case of the East Park Dam there was charged to maintenance account \$185 for the calendar year 1920 (p. 105). This structure, with related spillway and dikes, cost about \$154,000; the whole storage unit, involving in addition to the dam a feed canal and other items, cost somewhat over \$450,000 (p. 104). The dam is a concrete arch, gravity type, with a maximum height of 139 feet, crest length of 250 feet, and volume of 12,200 cubic yards (p. 538). It was completed in July, 1910 (p. 100). From that time to December 31, 1920, the maintenance account for the dam was charged with a total of \$8,015 (p. 105).

Similar data respecting other dams of the Reclamation Service can be found in the same way throughout the report. In some cases the data are not given separately for the dam, but show only the totals for the reservoir, and in a few cases there may be shown only the total figures for the project storage system, which may include more than one reservoir.

From these figures and from actual knowledge, I know that the maintenance costs on the dams themselves have been exceedingly low. Probably the bulk of the costs given in the report after the fashion above indicated do not represent any work on the main structures, but include repairs and replacement of operating mechanisms and such things which are related to the dams and which are much more subject to depreciation.

In a few cases there have been substantial expenditures connected with the dams of the Reclamation Service some time after their construction, and it may be that these are charged to the maintenance account, because they are technically classified that way in the eyes of the law governing us, and the charges we collect from the irrigators who benefit from the works. However, in these cases that I have in mind the substantial repairs or other work were due either to the repairing of damage by flood or to the completion of some work that was deliberately postponed when the dams themselves were first built. In the first category there were some substantial repairs to the spillway at the Roosevelt Dam on the Salt River, Ariz. In recent years a flood came with the reservoir full and put a considerable depth of water over the spillway. This eroded the spillway channels to an extent that made it seem wise to concrete them in anticipation of future floods. This might be called repair, but is more accurately described as betterment, being simply additional work over that originally contemplated and carried out, rather than repair or replacement of something that had been built and worn out.

In the other category falls another case of spillway improvement at the Elephant Butte Dam. Here it was always contemplated that substantial work would be required on the spillway additional to what was done when the dam was built, but the work was postponed to spare the expenditure until necessary as well as to permit the selection of a time for it that would be more advantageous and economical. It was clear that the work was not needed at first, because the reservoir was designed for large hold-over capacity and took a number of years to fill.

From such figures as I have I think the depreciation or maintenance on the body of a well-constructed masonry dam will usually be a small fraction of 1 per cent of its cost annually.

Very truly yours,

A. P. DAVIS, Director.

THE CHAIRMAN. I realize that you can not get anything but estimates on that. There has not been any dam like this ever constructed in the world, that is comparable in size, has there?

Senator MCKINLEY. Aswan Dam is just the same.

Major BURNS. I talked this matter over with the Alabama Power Co. They have their Coosa River dam that is subjected to practically the same kind of treatment the

Tennessee River dam would be. In other words, it has flood waters the same as the Tennessee. They thought that one-half of 1 per cent is quite a liberal allowance.

The CHAIRMAN. How long has that dam been constructed? It was only a few years ago that it was constructed?

Major BURNS. It must be nearly 10 years.

The CHAIRMAN. Don't you think, Major, that where you are considering a hundred-year period we ought to take into consideration the elements that we would not necessarily take into consideration when we were considering a shorter term? In other words, if an insurance company were going to write a policy on insurance, they would not be willing, no man would be, to guarantee the money to keep the dam in repair for a 100 years based on a percentage that they would be willing to take the risk on a 10-year basis, would they?

Major BURNS. No, sir; I don't think so. Apparently, however, the Alabama Power Co. does not feel that we would be justified in charging much more than that. They apparently charge a little less than one-half of 1 per cent.

Senator McKINLEY. This dam really shows something about \$30,000,000 for Dam No. 2, does it not?

Major BURNS. The cost of the structure, excluding the power house and machinery, and excluding also the amount charged to locks, is \$32,816,400. Of course, that includes the \$17,000,000 that have already been spent.

Senator McKINLEY. Certainly.

Major BURNS. On that basis.

Senator McKINLEY. That is, one-half per cent of \$32,000,000, or \$160,000 a year.

Major BURNS. \$164,082 a year, to be accurate on the basis of figuring outlined.

The CHAIRMAN. All right.

(9) That the cost of completing Dam No. 2 with four units will be \$37,800,000. Of this total amount the amount invested in equipment at any time will be \$1,000,000 plus \$550,000 for each unit installed. The amount invested in the dam structure and chargeable to power will be:

Amount invested.....	\$37, 800, 000
Equipment chargeable to power.....	3, 200, 000
	<hr/>
	34, 600, 000
Chargeable to navigation.....	2, 860, 000
	<hr/>
	31, 740, 000
Interest on capital during construction for structure chargeable to power.	1, 076, 400
	<hr/>
	32, 816, 400

From this it follows that the new capital chargeable to power will be with four units installed:

Structure.....	\$32, 816, 400
Equipment.....	3, 200, 000
	<hr/>
	36, 016, 400
Already invested.....	17, 000, 000
	<hr/>

New investment chargeable to power..... 19, 016, 400

(10) That Dam No. 3 will cost \$25,000,000, of which \$5,740,000 is chargeable to navigation, leaving \$19,260,000 chargeable to power, to which \$1,155,600 should be added for interest on capital during the construction period, making a total of \$20,415,600. Of this \$7,630,000 will be the cost of equipment, which expenditure will occur as follows:

First year.....	\$3, 210, 000
Second year.....	2, 210, 000
Third year.....	2, 210, 000
	<hr/>
Total.....	7, 630, 000

This leaves \$12,785,600 chargeable to the structure against the power development. An additional item of \$2,331,000, the estimated cost of flowage rights, should be considered if interest charges are figured.

(11) That no charges are made for interest, taxes, or insurance. These will be in a following paragraph.

Combination of Dam No. 2, fourth year (450,000 horsepower installed), and No. 2 steam plant.

SALE OF POWER.

Source.	Horse-power.	Kilo-watts.	Load factor.	Kilowatt hours per year.	Rate.	From sale of power.
			<i>Per cent.</i>			
From third year.....						\$4,068,180

Income.....	\$1,368,114
Cost.....	566,970
Balance.....	801,134

NOTE.—No charges made for interest, taxes, or insurance.

The CHAIRMAN. How many horsepower in each unit?

Major BURNS. Thirty thousand horsepower.

You will notice that we get less return out of 15 units than we do out of 12 units, even excluding interest charges. In other words, you start in to lose money by putting in more than 12 units.

The CHAIRMAN. Yes. You are trying to utilize too much secondary power.

Major BURNS. Yes, sir; and in the case of the fifth year there is a still greater loss.

The CHAIRMAN. The maximum return comes from your computation there, by an installation of 12 units?

Major BURNS. Yes, sir.

(d) Effects caused by changes in assumptions: It is impossible at this time to determine with any great accuracy the conditions under which power would be produced and sold at Muscle Shoals. It should be noted that errors in estimating the probable price or load factor would have a profound effect on the net result of the enterprise.

A change in the price of power amounting to 25 per cent, which in the case of primary power would change the price by 1 mill, will have the result of changing the income from Dam No. 2 by the following amounts: First year, \$627,948; second year, \$928,295; third year, \$1,014,545; fourth year, \$1,044,545; fifth year, \$1,069,545.

In the same way a reduction in the load factor from 80 and 60 per cent to 60 and 45 per cent, respectively, would have a similar effect. Reductions of this character in both load factor and price would result in reducing the income from dam No. 2 by the following amounts: First year, \$1,098,909; second year, \$1,624,316; third year, \$1,775,454; fourth year, \$1,827,954; fifth year, \$1,871,704.

The operation of the Muscle Shoals project as an independent power system might result in such unfavorable conditions as those mentioned above. On the other hand, the most efficient use of the power in connection with a large power system might result in a load factor somewhat higher than that used in the computation—i. e., higher than 80 per cent and 60 per cent.

(e) Deductions as to values of the Muscle Shoals power development: In the assumptions outlined above and in the calculations no consideration was taken of interest on investment. The following table indicates the interest charges at 4 per cent under the following assumptions:

(a) Total additional cost to complete and including interest on capital during construction, but deducting amounts chargeable to navigation as follows: Dam No. 2, \$2,860,000; dam No. 3, \$5,740,000.

(b) Same as above, but not deducting amounts chargeable to navigation.

(c) Total costs of projects and including interest on additional capital during construction, but deducting amounts chargeable to navigation as outlined above.

(d) Same as (c), but not deducting amounts chargeable to navigation.

NOTE.—Total additional cost to complete dam No. 2 with 18 units is taken at \$28,500,000, exclusive of interest on capital during construction.

Total cost to complete No. 3 dam is similarly taken at \$25,000,000, to which should be added cost of flowage rights taken at \$2,331,000.

Table of interest charges on costs developed in accordance with above assumption.

Item.	(a) Basis.		(b) Basis.	
	Cost.	Interest.	Cost.	Interest.

¹ Loss.⁴ Interest charges at 4 per cent on total cost of projects and including interest on additional capital during construction but deducting amounts chargeable to navigation.⁵ Interest charges at 4 per cent on total cost of projects and including interest on additional capital during construction and not deducting amounts chargeable to navigation.

Senator McKINLEY. As I get it, you figure that Dam No. 2 will bring in about \$1,700,000 net rental?

Major BURNS. With what installation, Senator? Did you follow the installation?

Senator McKINLEY. With the figures you gave there.

Major BURNS. Yes; but I gave it for various combinations.

Senator McKINLEY. That would mean on the full installation, would it not, there?

Major BURNS. It depends on what you call full installation.

Senator McKINLEY. I thought you stated that there.

Major BURNS. Without including interest your balance would be \$2,341,545.

The CHAIRMAN. That is with 12 units installed?

Major BURNS. That is the entire installation of 18 units.

Senator McKINLEY. Is that net?

Major BURNS. No, sir; that is exclusive of interest.

Senator McKINLEY. It is proposed in one of these leases to pay 4 per cent interest on, say, \$25,000,000, as rental, which would be \$1,000,000 a year as against \$2,700,000 return.

Major BURNS. I will give you that. I have figured out those interest charges.

The CHAIRMAN. You will come to that later, will you?

Major BURNS. Yes, sir. I was outlining the effect caused by the changes in assumptions. As part of a bigger system, of course, you would use the water more efficiently than you otherwise would. These are the deductions

if you take the interest into consideration. This is on the basis of charging 4 per cent on the additional cost to complete. On that basis your No. 2 Dam, with 4 units, would give you a net income of \$850,000 after payment of all expenses, including interest at 4.70; with 8 units it would give you a net income of \$1,300,000; with 12 units, \$1,366,000; with 15 units, \$1,272,000; and with 18 units, \$1,158,000. Of course, when you compare that with the Ford offer his return would be a little greater still, because he does not allow a depreciation charge of \$160,000 which we allow, and then he does not—

Senator MCKINLEY. On your figure, then, there is no economy to put in more than eight units?

Major BURNS. Yes, sir.

The CHAIRMAN. Twelve.

Major BURNS. You make money up to the twelfth unit. After that you are losing money.

Senator MCKINLEY. Did you not say \$1,360,000?

Major BURNS. Yes, sir. That is for 12 units.

The CHAIRMAN. That is without taking into consideration the possibilities of storage, is it not?

Major BURNS. Yes, sir.

The CHAIRMAN. If it develops later that storage is possible, that would be increased?

Major BURNS. Well, there is a question there, Senator, because when you increase the primary you reduce the secondary, and when you reduce the secondary it seems to me that you are very apt not to require so many of the units for the development of the secondary power.

The CHAIRMAN. Is not this the fact, that to make storage dams you would increase both the primary and the valuable secondary?

Major BURNS. Yes, sir.

The CHAIRMAN. In other words, you would equalize the flow of the river, and that secondary power that is of no value—and there is a great deal of it—

Major BURNS. Yes, sir.

The CHAIRMAN. Would be transformed into a different kind of secondary power that would have value?

Major BURNS. Yes, sir. That is correct.

The CHAIRMAN. And some other secondary would be transformed from secondary to primary.

Major BURNS. That is correct; yes, sir; but it would not prove that you would ever be justified in putting in more than some 12 or 14 units.

The CHAIRMAN. That may be correct. But, for instance, you show there in your table the amount of secondary power that is good for 7½ months in the year?

Major BURNS. Yes, sir.

The CHAIRMAN. That is not worth much as a commercial proposition.

Major BURNS. Not nearly as much as primary power.

The CHAIRMAN. It is not worth as much as if it were available for eight months instead of seven months.

Major BURNS. No, sir.

The CHAIRMAN. If we were to put in storage reservoirs and hold back the floods and make that power that is now available for seven and a half months available for eight months or ten months, that would increase the price you could get for it.

Major BURNS. Yes, sir. That is correct.

The CHAIRMAN. You could not expect to sell power that would be usable only seven months in the year to great advantage. There would have to be some peculiar condition in order to make it of marketable value.

Major BURNS. It is always difficult to secure a market for such secondary power.

The CHAIRMAN. The only object in getting a storage reservoir is to convert secondary power into primary power and also to convert secondary power of no value or little value into more valuable secondary power.

Major BURNS. Yes, sir. On that same basis of calculating the No. 3 dam, we would lose money every year.

The CHAIRMAN. On what basis?

Major BURNS. That we were just talking about, on paying 4 per cent interest on the additional money required to complete.

The CHAIRMAN. You mean by that it is not a feasible thing, from a financial point of view, to build Dam No. 3?

Major BURNS. Yes, sir. That is what our figures indicate.

The CHAIRMAN. That Dam No. 3 will cost more—

Major BURNS. You will lose money on Dam No. 3, even on these load-factor figures that we have put in and on the values of power. Of course, we have used throughout the high estimates of cost of construction, or the Engineer Department estimates, and if we were able to do it for much less that would have an appreciable effect upon the calculation and perhaps upon the conclusions.

The CHAIRMAN. Is it your opinion, then, that we ought to abandon No. 3?

Major BURNS. I can not see any logic in going ahead with No. 3 at the present time.

The CHAIRMAN. I judge that Colonel Barden did not hold that opinion, although I do not remember asking him directly.

Major BURNS. You can not prove the economic soundness of it, according to our figures. Our assumptions may be wrong.

The CHAIRMAN. Suppose you could develop storage. Would not that have some tendency to make it valuable?

Major BURNS. Oh, yes; because you would increase the amount of primary power, and you might be able to make No. 3 Dam pay for itself on this basis.

The CHAIRMAN. All right.

Major BURNS. These are the deductions we have made after all these studies:

(e) Deductions as to the value of the Muscle Shoals power developments: The following deductions as to the value of the Muscle Shoals power developments are derived from above tables:

1. That in accordance with above assumptions, Dam No. 2 (supplemented by No. 2 steam plant) could sustain itself as a power proposition, even though the total cost of the project plus estimated replacement value of steam plant were charged to power, and even though the maximum estimates of cost are accepted as the true ones. The margin is too small, however, to permit any appreciable reduction in either load factor or selling prices.

2. That Dam No. 2 could pay 4 per cent interest on the additional money required to complete, not deducting anything for navigation, and in addition could net a profit on a basis of 12 units installed of \$1,366,000 and on a basis of 18 units installed of \$1,158,542.

3. That it is not economically valuable to install in excess of 12 units at Dam No. 2 at the present time. (This includes about five months' power.)

4. That Dam No. 3 can not sustain itself as a power proposition if the entire cost of the project is charged to power and when the maximum estimates of cost are assumed.

5. That Dam No. 3 can about sustain itself as a power proposition when maximum estimates of cost are assumed and when deductions for navigation, amounting to \$5,740,000, are made.

6. That it is not economically valuable to install in excess of some 110,000 horsepower capacity at Dam No. 3 at the present time.

(This includes power of not less than six months use.)

7. That Dams Nos. 2 and 3 plus steam plant could about sustain themselves as a power proposition, even though the total cost of the project plus estimated replacement value of the steam plant were charged to power, but provided that only 360,000 horsepower capacity were installed at No. 2 and 110,000 horsepower capacity at No. 3. If all capacity were installed, they could not so sustain themselves.

8. That Dams Nos. 2 and 3 plus steam plant could pay 4 per cent interest on additional money required to complete (and not deducting anything for navigation), and in addition could net a profit on most economical power installation of \$1,184,000 per year, and on the basis of full installation could net profit of \$820,000.

The CHAIRMAN. In your estimate of No. 3 there, Major, where you say it will not sustain itself, you are counting interest at 4 per cent?

Major BURNS. Yes, sir.

The CHAIRMAN. And all the other items as estimated?

Major BURNS. Yes, sir.

The CHAIRMAN. And then you are deducting something over \$5,000,000 that is chargeable to navigation?

Major BURNS. Yes, sir.

The CHAIRMAN. And you are assuming that the flow of the river will remain as it is now and not be increased by the construction of storage reservoirs?

Major BURNS. That is correct; yes, sir.

The CHAIRMAN. Was it the intention of the Government originally, in the very beginning, to construct No. 3 as well as No. 2?

Major BURNS. I don't think any serious intention has ever been expressed by the Government to construct Dam No. 3.

The CHAIRMAN. How did they happen to go to work on it? How did they happen to make those borings? They have spent some money there.

Major BURNS. You are talking about something that I am not informed on; but I should imagine that those borings may have been made after the Ford offer was made to the Secretary of War. I may be wrong about that, but as I recall it I do not think the borings had been made prior to the Ford offer.

The CHAIRMAN. What connection would they have with the Ford offer?

Major BURNS. Because it immediately brought up the question of Dam No. 3.

The CHAIRMAN. Because that was included in his offer?

Major BURNS. Yes, sir.

Mr. LEVERING. Excuse me, but I have a full report on those soundings. They were made before the bid and are included in the report to Congress. There are about a hundred holes, I think. It was all in the report. It was before the Ford offer.

Major BURNS. That concludes the power end.

V. Relation of Muscle Shoals to fertilizers. The following framework is followed:

1. General statement.
 2. Quantity of commercial fertilizers used.
 3. Cost of commercial fertilizers and the ingredients thereof.
 4. Use of concentrated fertilizers.
 5. Production of phosphoric acid.
 6. Production of inorganic nitrogen and relation thereto of nitrate plants Nos. 2 and 1.
 7. Production of potash.
 8. Relationship between power and fertilizers.
 9. Relationship between Muscle Shoals location and fertilizers.
 10. Possibility of Muscle Shoals cheapening the price of fertilizers to farmers.
1. General statement: Ordinarily there are three important elements necessary for plant life which the soil itself is not able to supply in ample quantity, especially after the soil has been used for a considerable period of time in growing crops without well planned rotation thereof. These elements are fixed nitrogen, phosphoric acid, and potash. In some instances only one of the minerals is lacking in the soil, and in some instances two, and generally all three are lacking. The fertilizer industry of the world has been developed for the purpose of replenishing the soil with one or more of these ingredients. In the early days fertility was reestablished by placing back upon the soil animal and vegetable refuse developed on the farm. At this time no other substances were known to have fertilizing value. The development of chemical knowledge has shown, however, that inorganic substances can be used efficiently on the soil to increase its fertility, and as a result of this development the world has started to use in large quantities nitrogen, phosphoric acid, and potash developed from inorganic or mineral sources.
2. Quantity of commercial fertilizers used: The inorganic fertilizer business started its development in the United States about a generation ago, and at the present time has reached a capacity of approximately 8,000,000 tons of commercial fertilizer per year. This quantity is exclusive of the organic fertilizer made and used upon the farm for which no statistics are available. The consumption of commercial fertilizer during the various years and in the various States is about as follows:

FERTILIZER TONNAGE BY STATES.

Following is the list of States showing the consumption of fertilizers for the fiscal years ending in 1913, 1914, 1915, 1916, 1917, 1918, 1919, and 1920, compiled from the most reliable statistics that are obtainable. In some of the States there are absolutely no accurate figures available. For these States indicated

by an asterisk, estimates have been made, based on information obtained from State officials and fertilizer manufacturers.

* Fertilizer consumption for 1921 was 4,500,000 tons.

The Chief of the Bureau of Soils believes that the country could well afford to use, at the present time, some 16,000,000 tons of fertilizer per year if the price were sufficiently satisfactory. There is no doubt but what the tonnage of fertilizer will expand with time.

3. Cost of commercial fertilizer and the ingredients thereof: The cost of fertilizer to the farmer is dependent primarily upon the quantities of the various ingredients contained in the mixed fertilizer which he receives. The price fluctuates from year to year. At the present time the cost of fertilizer containing some 2 per cent nitrogen, 8 per cent phosphoric acid, and 2 per cent potash, to the farmer is some \$25 to \$30 a ton. The total commercial fertilizer bill of the farmer on this basis is some \$200,000,000 to \$240,000,000 per year. In accordance with testimony of the Chief of the Bureau of Soils, Department of Agriculture, the cost to the farmer of 1919 commercial fertilizer tonnage was \$225,000,000. In accordance with data obtained from the Department of Commerce, the cost to the farmer of 1914 fertilizer tonnage, or 8,430,000 tons, is \$153,000,000; and of the 1919 tonnage, or 8,290,000 tons, \$280,000,000.

Any one of the three essential elements can be used on the farm separately and with value to the farmer provided, of course, that the soil on which it is used needs that particular element. Large quantities of various materials are used in this way. For this reason it is not easy to make a statement as to what the average content of each of the various elements of the total tonnage of fertilizer is. It seems to be the consensus of opinion, however, that the total fertilizer tonnage can be figured as containing an average content of not less than 2 per cent nitrogen, 8 per cent phosphoric acid, and 2 per cent potash. This would give a consumption of 160,000 tons of nitrogen per year, 640,000 tons of phosphoric acid per year, and 160,000 tons of potash per year. On this basis, from the standpoint of cost to the farmer, the nitrogen represents about 52 per cent of the total cost of ingredients, phosphoric acid 35 per cent, and potash 13 per cent. These percentages are developed by assigning to nitrogen a unit value of \$3.65 (the equivalent of a unit value of \$3 for ammonia), the phosphoric acid a unit value of 50 cents, and potash a unit value of 70 cents. A unit represents 20 pounds or 1 per cent of the ton.

Some authorities believe that the average fertilizer contains larger quantities of nitrogen and potash than outlined above. This would immediately affect the quantities of the various materials used and the ratio of cost to the farmer. If we assume that the average fertilizer is 3 per cent nitrogen, 8 per cent phosphoric acid, and 3 per cent potash instead of 2-8-2, as indicated above, the quantity of nitrogen is increased from 160,000 tons per year to 240,000 tons. Similar increase takes place in the case of potash. With the same unit costs, the percentages of total cost of ingredients to the farmer of the three ingredients are as follows:

	Per cent.
Nitrogen	60
Phosphoric acid	26
Potash	14

The cost of assembling ingredients, mixing them, and distributing them to the users, including sales expenses, profits, etc., amounts to some 50 per cent of the entire fertilizer bill. This shows the large possibility to the farmer of reducing the cost of fertilizers through "home" mixing of the ingredients. "Home" mixing might reduce the price of fertilizer in some instances by one-third and on the average by some 10 to 15 per cent.

In other words, that has great possibilities in it. It has been recommended for years.

Transportation charges cost the farmer some 30 to 40 per cent of the entire fertilizer bill. Those transportation charges include the freight on the ingredients as well as freight on the finished mixed fertilizer.

4. Use of concentrated fertilizers: On the basis of 2-8-2 commercial fertilizer contains only 12 per cent plant food. On the basis of 3-8-3 the fertilizer contains only 14 per cent plant food. The balance in either case, or some 86 to 84 per cent, is either carrier or filler. The greater part is natural carrier, which can not be eliminated under present fertilizer practice; for instance, ammonia, which is one of the important fertilizer ingredients, inasmuch as it is over 80 per cent nitrogen, can not be placed on the farm as such; it is a gas and must therefore be combined with a carrier. The present carrier is sulphuric acid, and the resultant material is ammonium sulphate. In the sulphate the ammonia content is only 24 per cent and the balance, or 76 per cent, is necessary carrier. In the case of several other ammonia compounds the percentage is much less. Similarly potash and phosphoric acid have carriers which have no other fertilizer value in the present-day fertilizer system. In addition to these carriers, the fertilizer companies in many cases add a small amount of inert filler to make the proportions correct, so that the finished material purchased by the farmer will be of the proper grade and composition; as, for instance, 2 per cent nitrogen, 8 per cent phosphoric acid, and 2 per cent potash, or perhaps 1 per cent nitrogen, 8 per cent phosphoric acid, and 3 per cent potash. A concrete example may help to make this clear. If it is desired to make a mixture containing 2 per cent of ammonia, 8 per cent of phosphoric acid, and 2 per cent of potash (the well-known grade 2-8-2) and the materials at hand are cottonseed meal, containing 7 per cent of ammonia, acid phosphate, containing 16 per cent of phosphoric acid, and Nebraska potash, containing 28 per cent of potash, the method of making up the mixture will be as follows: 2 per cent of a 2,000-pound ton is 40 pounds; in order to obtain 40 pounds of ammonia from 7 per cent cottonseed meal it will be necessary to

use 571 pounds of cottonseed meal. The amount of phosphoric acid desired is 8 per cent of a ton, or, in fertilizer parlance, 8 units, or 160 pounds. To obtain 160 pounds from a 16 per cent acid phosphate will require 1,000 pounds of acid phosphate. The amount of potash called for is 40 pounds, and to obtain that from a 28 per cent material 143 pounds will be required. The total amount of materials used, therefore, will be 571 plus 1,000 plus 143, or 1,714 pounds. To this are added 286 pounds of filler in order to make up the ton.

It seems to be the consensus of opinion that one of the greatest possibilities for cheapening the cost of fertilizer to the farmer is to use more concentrated fertilizer, which would at once materially reduce freight which the farmer has to pay, as a large part of the useless materials now transported by freight might be eliminated. While it is possible with present-day fertilizer systems to use more concentrated fertilizers on the average than are to-day being used, it would not be possible to use highly concentrated fertilizers without installing practically a new system of fertilizer manufacture and distribution in America. If the insertion of filler in the present-day fertilizer could be satisfactorily eliminated, that in itself would reduce the quantities of useless materials that are transported from the fertilizer mixing plants to the farmer. This would not amount, however, in excess of some 200 or 300 pounds per ton in the average mixed fertilizer, and it would eliminate freight only from the mixing plant to the farmer and in the ordinary case this mileage is not very great. But it is not easily to eliminate even all of this filler.

But by far the greater opportunity lies in the substitution of useful for useless carriers. It so happens that ammonia and phosphoric acid, both concentrated plant foods, can be combined and would serve each other as carriers. Similarly, potash and phosphoric acid, again both concentrated plant foods, can be combined and would also serve each other as carriers. By using such materials a combination can be formed of ammonia phosphate, potassium phosphate and ammonium nitrate which would give a concentrated mixture containing approximately 75 per cent of real plant food as against the 12 or 14 per cent contained in present-day fertilizers, and an average maximum of some 16 or 17 per cent that might be contained in present-day fertilizers if the filler were in all cases eliminated. Such concentrated fertilizer should not be directly applied to the soil but should be diluted with some substance in order to prevent the damage that might be caused by overfeeding of the plant due to uneven distribution. It so happens that these concentrated fertilizer materials can be diluted with water, as all of them are soluble in water. Therefore, if the farmer should dissolve this concentrated plant food in the proper quantity of water he could sprinkle the solution on the soil in such a way as to most benefit the plant.

Such a scheme as the above for the utilization of concentrated fertilizer seems to be one of the main hopes of the Agriculture Department and of other people strongly interested in helping the farmer. It is contrary, however, to the present system in which the fertilizer companies do the mixing and send to the farmer a substance which he can apply to the soil without modification. It is, furthermore, essentially dependent upon the availability in large quantities of cheap phosphoric acid. Such material can not be produced at the present time at a satisfactory price, and it is to be remembered that this country has been endeavoring to produce such cheap phosphoric acid for a generation. The concentrated fertilizer solution can, therefore, be brought about only by gradual evolution.

As I said before, the question of cheaper phosphoric acid is a very vital one. I have felt myself that there has not been testimony before the committee to prove that a cheaper phosphoric acid can be produced.

5. Production of Phosphoric Acid: At the present time phosphoric acid is derived from the phosphate rocks of Tennessee and Florida. These rocks are treated with sulphuric acid with consequent development of acid phosphate. This acid phosphate contains about 16 per cent phosphoric acid, which can be extracted by the plant from the acid phosphate. Inasmuch as the sulphuric acid which is combined with the phosphate rock in about an equal quantity is of no use to the soil it has been the endeavor of the agricultural people for many years to obtain a phosphoric acid which is free from sulphuric acid and which can be made available to the farmer at no greater expense. Phosphate rock can be treated in the electric furnace and concentrated phosphoric acid produced. The Agriculture Department and private plants have been experimenting with such a process for some time. Testimony indicates that the Federal Phosphorus Co. of Anniston, Ala., has sufficiently perfected an electric

furnace phosphoric acid so that it can compete in the food markets only with phosphoric acid manufactured by means of sulphuric-acid processes. The president of such company entertains great hopes that with cheap power phosphoric acid can be manufactured so cheaply by the electric-furnace process as to allow such material to compete in the fertilizer trade with the acid phosphate at present produced with sulphuric acid. If this scheme could be developed, Muscle Shoals, provided it can produce sufficiently cheap power, might assist in the development of cheaper phosphoric acid, one of the essential plant foods. Such material might, in turn, assist in bringing about in America the early use of concentrated fertilizers. This scheme of concentrated fertilizers is, to repeat, in great measure dependent upon the production of cheap phosphoric acid. It is again pointed out that it costs some \$70 per ton of nitrogen to convert ammonia into ammonium sulphate. This is approximately 25 per cent of the selling price of nitrogen in the form of sodium nitrate or ammonium sulphate.

6. Production of inorganic nitrogen and relation thereto of nitrate plants Nos. 2 and 1: As already pointed out, there are three sources of inorganic nitrogen, namely, by-product coke oven ammonia, nitrate of soda, and air nitrogen fixation products. Repeating again, nitrogen fixation must sooner or later become one of the principal sources of inorganic nitrogen, and the business must be established in the United States. Muscle Shoals could affect only this latter source of material.

The conclusions as to costs of fixing nitrogen in competition with ammonium sulphate and Chilean nitrate when such fixation was done in new plants of the cyanamid, the Haber-Bosch, and the Haber electrolytic processes were outlined in a preceding chapter.

These conclusions were to the effect that with present knowledge and under the present fertilizer system neither new cyanamid plants nor new Haber-Bosch plants would be expected with power at zero to show any appreciable profit in competition with the average prices of nitrogen much less to reduce the prices thereof. A new Haber electrolytic plant could about break even on 3-mill power and should show a profit of \$18 per ton or 6.3 per cent for every reduction of 1 mill in the price of power. Even with no interest charges on the replacement value of the No. 2 plant, which interest charges are taken at \$30 per annual ton of nitrogen produced, the No. 2 plant, making ammonium sulphate by the cyanamid process, could only break even in competition with the average price of ammonium sulphate if power cost 2 mills per kilowatt hour. With power at 1 mill it could make a profit of \$15 per ton of nitrogen, or about 3 per cent. The No. 2 plant can produce materials of fertilizer value other than ammonium sulphate, and developments may prove that they can be made at a satisfactory price. Such a condition does not exist at the present time.

If the No. 2 plant were converted into a Haber electrolytic plant it is believed that it could be accomplished at a cost of \$250 per ton of nitrogen capacity as against the estimated new cost of \$485 per ton. This reduction is caused by availability of facilities of various kinds, by the availability of necessary liquid air plant, by availability of power, of buildings which could be used, etc. On basis of 40,000 tons' capacity this would amount to a saving of \$9,400,000 in capital cost and a reduction in cost of producing nitrogen—in form of ammonium sulphate—by \$14.10 per ton of nitrogen. (This assumes a reduction of 6 per cent interest on saving in construction cost of \$235 per ton capacity. Other charges would remain the same.)

THE CHAIRMAN. Now, Major, you would not advise us to do that with No. 2 until it has been first demonstrated by the use of No. 1 as an experimental plant that it was a practical proposition?

MAJOR BURNS. I should say that a progressive method would be the best way to tackle it.

THE CHAIRMAN. In other words, we would not want to destroy No. 2 because of its war possibilities for explosives until we absolutely knew that by its destruction and dismantling we could improve and make the thing cheaper?

MAJOR BURNS. Yes, sir; and that is a very good point. You ought to go to any of these new processes by steps.

THE CHAIRMAN. The idea, I take it, would be to use No. 1, remodel that, and then operate it for a time and see what it will do, and not dismantle No. 2 or transform it until we know from actual experience that No. 1, that we would improve, would be usable.

MAJOR BURNS. Of course, this Haber electrolytic system is a rather easy system to operate. The big difficulty with the Haber water-gas system is that you

get a great many impurities in your gases. After you get the hydrogen and the nitrogen they are so impure that you have got to work on them a great deal in order to eliminate these poisons. It is one of the most difficult parts of the process. In the Haber electrolytic process, on the other hand, the gases are obtained in a very pure state. The nitrogen is obtained in the same way as at No. 2 plant, or by fractional distillation of air. The hydrogen is obtained by the electrolysis of water. There is no question as to the ability to do this. It is just a question of cost. We know we can break water down by electrolysis into its elements. That, of course, has been established for many years. The welding of the gases is done in the same way in either process. However, I think the scheme of going to your ultimate plant by moderate steps is a sound one.

The CHAIRMAN. Of course, we have that cyanamid plant there, No. 2, as a war proposition. It was constructed as a war proposition. We realized that the probabilities are that the improvement and cheapening of the extraction of nitrogen from the air is going to come from the Haber process, or a modification of it; but until we know it we would not want to destroy plant No. 2, so that in case of war we could not utilize that, although it would be expensive, but it would be much better than not having anything.

Major BURNS. On the basis of 2-mill power the No. 2 plant, if modified to use the Haber electrolytic process, might therefore make a saving of \$32 per ton of nitrogen on the average selling price thereof in the form of nitrate of soda or ammonium sulphate, or 10½ per cent of such selling price. If this were all applied to commercial fertilizers of 2-8-2 composition it would make a saving per ton of about 64 cents or approximately 2 per cent. United States Nitrate Plant No. 1 is not at present able to fix nitrogen. To round out the plant by the Haber electrolytic process so that it could produce ammonia up to its rated capacity, or the equivalent of 8,000 tons of nitrogen per year would cost about three-fourths as much as a new plant, or some \$360 per ton year capacity of nitrogen. The new capital saving would be about \$1,000,000. The saving in cost of production in this case would amount to the interest on \$125 or \$7.50 per ton of nitrogen. This amounts to about 2½ per cent of the selling price of nitrogen and practically vanishes in the case of a commercial fertilizer.

The developments of the future, and most people seem to think that important improvements and inventions are bound to occur in this connection, may give us new processes or modifications of old ones which will materially cheapen the price of available air-fixed nitrogen.

6. Production of potash: Potash at the present time is obtained through importations from deposits in Alsace and in Germany. Potash exists in large quantities in the United States but in an insoluble form in shales and mineral rocks. It is possible to extract this potash from such rocks and make it available as plant food by means of the electro furnace and other methods. As to whether this can be done at a cheaper price than that which we must pay Germany, is not yet proved although one witness—Mr. Edison—has indicated that he can produce potash from rocks at a price which is nearly as low as that now paid Germany, and he further believes that he can reduce such price. Here, again, cheap power might have an appreciable effect upon the cost of the third of the essential elements.

7. Relationship between power and fertilizers: One of the big advantages that has always been claimed for Muscle Shoals in the cheapening of fertilizers is the possibility of cheap power. It is important, therefore, to understand the relationship between power and fertilizers. To fix one ton of nitrogen by the various processes with present knowledge requires the following quantity of power:

Kilowatt hours required per ton of nitrogen.

Process:

Cyanamid	15,000
Haber-Bosch (water-gas hydrogen)	4,000
Haber electrolytic (hydrogen from electrolysis of water)	18,000

To produce 1 ton of phosphoric acid from phosphate rock by the electric furnace with present knowledge requires 6,000 kilowatt hours.

Knowledge is not available as to power required to produce potash from potash-bearing shales.

One mill per kilowatt hour in the price of power, therefore, has the following effects on the price of a ton of nitrogen or a ton of phosphoric acid: Cyanamide process, \$15 per ton of nitrogen; Haber-Bosch process, \$4 per ton of nitro-

gen; Haber electrolytic process, \$18 per ton of nitrogen; electric furnace, phosphoric acid, \$6 per ton of phosphoric acid.

On the basis of a fertilizer containing 2 per cent nitrogen and 8 per cent phosphoric acid, the effect on 1 mill per kilowatt hour in the price of power would have the following effects in the price of commercial fertilizers: Cyanamide process, \$0.30 per ton; Haber-Bosch process, \$0.08 per ton; Haber electrolytic process, \$0.36 per ton; electric furnace, phosphoric acid, \$0.48 per ton; 100,000 continuous horsepower, through the cyanamide process, will fix approximately 40,000 tons of nitrogen per year as ammonia, which latter quantity is about 25 per cent of the nitrogen at present used in commercial fertilizers; 100,000 continuous horsepower through the Haber electrolytic process will fix approximately 32,000 tons of nitrogen per year or about 20 per cent of the present consumption; 100,000 continuous horsepower would produce in the electric furnace about 110,000 tons of phosphoric acid per year or about 16 per cent of the present consumption.

9. Relationship between the Muscle Shoals' location and fertilizers: Muscle Shoals is located in a region which consumes large quantities of fertilizers. A table has been inserted to show the consumption by States. The consumption within the neighboring States of Tennessee, North Carolina, South Carolina, Georgia, Alabama, and Mississippi is over half of the consumption within the United States. These are included within a maximum radius of about 800 miles. From Muscle Shoals to the seaboard, covered by these States, represents an average distance of some 400 miles. From the standpoint of rail transportation the location of Muscle Shoals should, therefore, be economical within a radius of some 200 to 250 miles. In other words, if fertilizers could be manufactured as cheaply at Muscle Shoals as the present commercial fertilizers are produced, the region within a radius of some 200 to 250 miles of Muscle Shoals should get its fertilizers at a cheaper rate than at present. If they could be produced more cheaply this zone would increase and vice versa. This area is using, probably, less than 1,000,000 tons of fertilizer or less than one-eighth the total consumption, while Muscle Shoals could make about one-fourth the nitrogen now used in fertilizers. Navigation development of the Tennessee River might also extend this zone. The development of a concentrated fertilizer would extend this zone. Muscle Shoals is also within about 100 miles by rail from the phosphate-rock deposits at Columbia, Tenn. The transportation of this material to Muscle Shoals for working would probably be about the same as the present costs of transporting phosphate rock from the Florida mines to the Atlantic seaboard. Potash, bearing shales, also exist in the near vicinity. The nitrogen of the air is, of course, equally available to all locations.

10. Summary of the possibility of Muscle Shoals cheapening the cost of fertilizers to the farmer: Some 55 per cent of the total cost of ingredients in fertilizers is chargeable to nitrogen, 30 per cent to phosphoric acid, and 15 per cent to potash. The cost of ingredients represents about 50 per cent of the cost of fertilizer to the farmer. To collect the ingredients, mix them, and distribute them, including sales expenses, profits, etc., represents about 50 per cent of the cost of fertilizers to the farmers. The transportation costs which are included in the above costs of ingredients as well as in the collection and distribution costs amount to some 30 to 40 per cent of the cost of fertilizer to the farmer. The carrier, namely, sulphuric acid, which is used to make ammonia available as fertilizer materials, represents a large item of cost. This sulphuric acid has no fertilizer value.

In the matter of ingredients, Muscle Shoals, on the basis of converting the No. 2 plant into a Haber electrolytic plant and with power at two mills and allowing for all costs including interest, depreciation, insurance, taxes, etc., but not allowing for profits, might save \$32 per ton of nitrogen on the average selling price over the 1900-1914 period and also the present price, namely, \$281 per ton. This amounts to some 10½ per cent of such price. If this saving were all given to the farmer it would amount to a yearly saving of \$1,260,000, or about one-half of 1 per cent of the total fertilizer bill. And if such production forced a reduction of \$32 a ton on all nitrogen consumed in fertilizer, the total saving to the farmer would be some \$5,000,000 to \$6,000,000, or some 2 to 3 per cent of present fertilizer bill.

In the case of phosphoric acid, present knowledge does not justify the statement that any savings can be made because no evidence is available that phosphoric acid can be produced sufficiently cheaply by electro-furnace meth-

gen; Haber electrolytic process, \$18 per ton of nitrogen; electric furnace, phosphoric acid, \$6 per ton of phosphoric acid.

On the basis of a fertilizer containing 2 per cent nitrogen and 8 per cent phosphoric acid, the effect on 1 mill per kilowatt hour in the price of power would have the following effects in the price of commercial fertilizers: Cyanamide process, \$0.30 per ton; Haber-Bosch process, \$0.08 per ton; Haber electrolytic process, \$0.36 per ton; electric furnace, phosphoric acid, \$0.48 per ton; 100,000 continuous horsepower, through the cyanamide process, will fix approximately 40,000 tons of nitrogen per year as ammonia, which latter quantity is about 25 per cent of the nitrogen at present used in commercial fertilizers; 100,000 continuous horsepower through the Haber electrolytic process will fix approximately 32,000 tons of nitrogen per year or about 20 per cent of the present consumption; 100,000 continuous horsepower would produce in the electric furnace about 110,000 tons of phosphoric acid per year or about 16 per cent of the present consumption.

9. Relationship between the Muscle Shoals' location and fertilizers: Muscle Shoals is located in a region which consumes large quantities of fertilizers. A table has been inserted to show the consumption by States. The consumption within the neighboring States of Tennessee, North Carolina, South Carolina, Georgia, Alabama, and Mississippi is over half of the consumption within the United States. These are included within a maximum radius of about 800 miles. From Muscle Shoals to the seaboard, covered by these States, represents an average distance of some 400 miles. From the standpoint of rail transportation the location of Muscle Shoals should, therefore, be economical within a radius of some 200 to 250 miles. In other words, if fertilizers could be manufactured as cheaply at Muscle Shoals as the present commercial fertilizers are produced, the region within a radius of some 200 to 250 miles of Muscle Shoals should get its fertilizers at a cheaper rate than at present. If they could be produced more cheaply this zone would increase and vice versa. This area is using, probably, less than 1,000,000 tons of fertilizer or less than one-eighth the total consumption, while Muscle Shoals could make about one-fourth the nitrogen now used in fertilizers. Navigation development of the Tennessee River might also extend this zone. The development of a concentrated fertilizer would extend this zone. Muscle Shoals is also within about 100 miles by rail from the phosphate-rock deposits at Columbia, Tenn. The transportation of this material to Muscle Shoals for working would probably be about the same as the present costs of transporting phosphate rock from the Florida mines to the Atlantic seaboard. Potash, bearing shales, also exist in the near vicinity. The nitrogen of the air is, of course, equally available to all locations.

10. Summary of the possibility of Muscle Shoals cheapening the cost of fertilizers to the farmer: Some 55 per cent of the total cost of ingredients in fertilizers is chargeable to nitrogen, 30 per cent to phosphoric acid, and 15 per cent to potash. The cost of ingredients represents about 50 per cent of the cost of fertilizer to the farmer. To collect the ingredients, mix them, and distribute them, including sales expenses, profits, etc., represents about 50 per cent of the cost of fertilizers to the farmers. The transportation costs which are included in the above costs of ingredients as well as in the collection and distribution costs amount to some 30 to 40 per cent of the cost of fertilizer to the farmer. The carrier, namely, sulphuric acid, which is used to make ammonia available as fertilizer materials, represents a large item of cost. This sulphuric acid has no fertilizer value.

In the matter of ingredients, Muscle Shoals, on the basis of converting the No. 2 plant into a Haber electrolytic plant and with power at two mills and allowing for all costs including interest, depreciation, insurance, taxes, etc., but not allowing for profits, might save \$32 per ton of nitrogen on the average selling price over the 1900-1914 period and also the present price, namely, \$281 per ton. This amounts to some 10½ per cent of such price. If this saving were all given to the farmer it would amount to a yearly saving of \$1,260,000, or about one-half of 1 per cent of the total fertilizer bill. And if such production forced a reduction of \$32 a ton on all nitrogen consumed in fertilizer, the total saving to the farmer would be some \$5,000,000 to \$6,000,000, or some 2 to 3 per cent of present fertilizer bill.

In the case of phosphoric acid, present knowledge does not justify the statement that any savings can be made because no evidence is available that phosphoric acid can be produced sufficiently cheaply by electro-furnace meth-

oids to warrant its use in fertilizer in competition with acid phosphate produced by sulphuric acid.

In the case of potash no savings can be made with present knowledge. In the matter of collecting, mixing, distributing, and selling mixed fertilizer which costs about 50 per cent of the total cost of fertilizers, the greatest benefit can be obtained by "home" mixing by the farmer himself. By this means he might be able to reduce his costs some 10 to 15 per cent. Muscle Shoals might have some beneficial effect in this respect but it is difficult to measure it.

Exclusive of rate consideration, transportation charges can be reduced in general by reducing the quantity hauled or by reducing the length of haul. The quantity hauled could best be reduced by increasing the strength of fertilizers and thus reducing the quantity of useless materials transported. This is in great measure dependent upon cheap phosphoric acid, which is a hope but not a reality. Length of haul could be reduced by manufacturing the ingredients and the fertilizers in the near vicinity of their use. If Muscle Shoals could equal the price of present commercial fertilizers or the ingredients thereof, it could affect favorably the price of fertilizers within a radius of about 200 to 250 miles of Muscle Shoals.

In the matter of carrier, it costs some 20 per cent of the cost of nitrogen to convert ammonia into ammonium sulphate. This costs the farmer, exclusive of transportation charges, some \$7,000,000 per year. With cheap phosphoric acid, some \$5,000,000 of this cost could be saved. But while cheap power is necessary to cheap phosphoric acid, there is no assurance at present that Muscle Shoals can satisfactorily solve this problem.

To sum up on basis of present knowledge, Muscle Shoals does not offer any reasonable expectation of even appreciably reducing the average price of fertilizers to the general farmer of the country. It does offer some hope of reducing the price of nitrogenous fertilizers only to the farmers living within a radius of some 200 miles of Muscle Shoals. It can make available to the fertilizer trade, at a price equal to present price and pre-war average, some 25 per cent of the present tonnage of nitrogen used in commercial fertilizers. With the extensive and intensive research and development that might go with the establishment at Muscle Shoals of a large and new fertilizer business important and beneficial improvements in the methods of manufacture, distribution, and use of fertilizers might ensue.

VI. Relation of Muscle Shoals to munitions preparedness. The following framework is followed:

1. Importance of fixed nitrogen to munitions.
2. Source of nitrogen for munitions purposes.
3. General solution of munitions preparedness.
4. Application of general solution to nitrogen preparedness.

5. Relation of Muscle Shoals to nitrogen preparedness. (a) United States nitrate plant No. 2; (b) hydroelectric development.

1. Importance of fixed nitrogen to munitions: Fixed nitrogen is an essential ingredient of smokeless powder, black powder, T. N. T., and practically every known type of military high explosives. It is also an essential ingredient of many of the poisonous gases used in the World War. Therefore no gun can be fired or no shell, bomb, or torpedo exploded without the use of fixed nitrogen, and without these types of ammunition the present-day army or navy would be helpless. An adequate supply of fixed nitrogen is, therefore, of basic importance, and we must not only provide a supply for munitions but also for indispensable industries and fertilizers.

2. Sources of nitrogen for munitions purposes: As already stated, there are three sources of supply of fixed nitrogen for munitions purposes, namely, Chilean nitrate, by-product coke ovens, and fixed atmospheric nitrogen. The first of these is a foreign source and therefore can not be depended upon in case of war. If we did not have to fear the stoppage of importations we would have no military nitrogen problem. Our supply must be assured from the two latter sources.

By-product coke ovens are to-day producing about 60 per cent of the coke used in the United States and about 100,000 tons of fixed nitrogen per year. Some further peace-time expansion will take place and is very much to be desired from the standpoint not only of preparedness for war but also of the economical utilization of the resources of nature. But the war-time expansion of this source of nitrogen should not be relied upon solely to supply our probable war requirements of nitrogen. By-product ovens are difficult and ex-

pensive to build and their expansion in excess of the market requirements for coke, their principal product, could only be justified if no cheaper sources of nitrogen and of other necessary by-products were available. For the production of nitrogen only, there is a cheaper source, and this is by the fixation of atmospheric nitrogen. The satisfactory development of nitrogen fixation is therefore a paramount importance from the standpoint of war preparedness.

3. General solution of munitions preparedness: The World War has very definitely emphasized the fact that new man power can be mobilized, trained, and placed on the battle front at a much more rapid rate than can munitions be manufactured, assembled, and delivered to the fighting forces at the battle front.

While the time interval varies with different types of munitions, it can be stated in general that it requires on the average some 12 months longer to deliver new munitions to the battle front than it does to deliver new man power. In the case of nitrogen it is not less than 17 months.

Proper war preparedness required therefore that we keep on hand in war reserves sufficient stocks of the essential munitions of various kinds to supply our probable war army until new production is adequate.

The above principle is of basic importance in any policy of national preparedness. If it is not followed out we are certain to be forced in time of war to send our troops to battle with inadequate supplies of fighting materials.

4. Application of general solution to nitrogen preparedness: In the case of nitrogen, as already stated, it requires some 17 months to construct new nitrogen fixation plants and get their product to powder and explosive plants, convert these materials into ammunition and get the ammunition to the battle front in sufficient quantity to meet the probable demands of a war army.

The demand during that time must, therefore, be made up from stocks on hand and from the production that can be obtained from available facilities. In the judgment of the Ordnance Department the nitrogen production of by-product coke ovens plus commercial stocks of nitrogen should be sufficient to care for the needs of the essential industries and of fertilizers in case of a defensive war. War requirements for munitions purposes would have to be met by the war reserve stocks of nitrogen in various forms, such as nitrate of soda, smokeless powder, high explosives, ammunition, etc., and by the production of nitrogen fixation plants. The quantities of stocks and facilities required depend upon the probable war requirements which are not easy of determination, as they are dependent upon the enemy or combination of enemies that we may be called upon to fight.

With increased availability of nitrogen-fixation plants we would be justified in reducing our war reserves, and vice versa. The present approved policy of the War Department for the assurance of an adequate supply of nitrogen for munitions purposes requires the retention of certain stocks of nitrate of soda, powder, explosives, ammunition, etc., and, in addition, the maintenance in stand-by at least of United States nitrate plant No. 2 until an adequate supply of nitrogen is assured by the commercial development of nitrogen fixation.

5. Relation of Muscle Shoals projects to nitrogen preparedness. (a) United States nitrate plant No. 2: This plant plays a very important part in the nitrogen solution. It can fix sufficient nitrogen to supply constantly some 12 divisions which would be organized, equipped, and fought in the same way as the World War divisions. As an indication of the importance of this statement it is to be noted that our maximum military effort of the World War, or the Meuse-Argonne offensive, used only 30 divisions.

In pursuance of the policy outlined above, this plant would only be retained in stand-by until we are assured of an adequate supply by commercial development. The cost of pursuing such a policy is of importance, and while it is very difficult of determination, it has been outlined by the Ordnance Department as follows:

"The cost can be divided into two classes: Those required for depreciation or replacements, and those required for caretaking force.

"Depreciation and obsolescence charges.

"In the case of Government reserve plants high depreciation and obsolescence charges are not justified. Depreciation charge of some 5 per cent on the replacement value of the plant is justifiable in the case of a commercial plant. This is so because the plant will have to keep thoroughly up to date in the art, so that it will be comparable in efficiency with the latest developments. This condition is not necessary in war reserve plants. In these latter surety of production is the important point, and the economy of production is not vital, as the war operation would last a comparatively short time. In the case of a

war reserve plant, therefore, the depreciation charge amounts to the cost of making such necessary replacements as would keep the plant available for operation.

"The Ordnance Department believes that during the first 20 years of the life of the United States nitrate plant No. 2 necessary replacements could be financed for a total of \$2,000,000 or an average of \$100,000 a year. After that date replacements would undoubtedly rapidly increase in cost. The Ordnance Department does not feel, however, that it would be necessary in any case to retain nitrate plant No. 2 for a greater period of time than 20 years, for it feels that within such a time nitrogen fixation will become an established commercial business and that the Government will be justified in depending upon such business for its supply of nitrogen in case of need. However, if the period is extended to 100 years, it is probable that replacement charges over the entire 100 years would, in the case of the No. 2 plant, cost approximately \$40,000,000, or an average of \$400,000 per year.

"Care-taking charges: It is believed that the care-taking forces of nitrate plant No. 2 can be financed with an expenditure of \$100,000 per year.

"Total cost: The total cost of maintaining nitrate plant No. 2, therefore, amounts to \$200,000 per year, if we assume that it will be required for a period of 20 years. It amounts to \$500,000 per year, if we assume that it will have to be maintained for a period of 100 years.

"Deductions: As an offset to these costs, the steam plant of nitrate plant No. 2 can undoubtedly be leased at an appreciable rental. At the present time it is under lease to the Alabama Power Co. at a fixed rental charge of \$120,000 per year, to which should be added 2 mills for each kilowatt-hour of power generated, which may bring the total rental up to some \$200,000 per year. The expenditures outlined above would be decreased by the amount of this return."

During any year this plant should, under full operation, produce some 40,000 tons of nitrogen. Starting from stand-by condition it could probably produce only about one-half that amount. The maintenance of the plant in an operating condition is, therefore, from this point of view alone, more valuable to the Government than its retention in stand-by; and in addition, operation should make it more surely available, provided, of course, that it were not allowed to run down. The same preparedness under an operating condition might be achieved by reducing our reserve stocks. It is not believed, however, due to the many complications of ammunition manufacture, that our war stocks of sodium nitrate should be allowed to fall below some 100,000 to 150,000 tons.

(b) United States nitrate plant No. 1: The United States nitrate plant No. 1 is not a thoroughly developed plant and is not dependable as a source of supply of fixed nitrogen at the present time. It is not believed, therefore, to be of sufficient value to the War Department to retain it as a reserve plant. It would undoubtedly be proper from the military standpoint to perfect this synthetic or Haber process and have it ready in case of an emergency, except for the fact that the Air Nitrates Corporation has satisfactorily developed the process at their Syracuse plant. It is believed, therefore, that nitrate plant No. 1 can be disposed of without restriction from the standpoint of military preparedness.

(c) Hydroelectric development: World War experience showed that one of the most difficult materials to obtain was power. The chemical part of the United States nitrate plant No. 2 was started in February, 1918, and was essentially complete at the time of the armistice, or November, 1918. However, the large 60,000-kilowatt steam plant at nitrate plant No. 2 was not ready for service for several months thereafter. By the cyanamid process 100,000 horsepower will fix sufficient nitrogen for about 12 divisions. The Muscle Shoals hydroelectric development from the power standpoint would, therefore, be a very important war reserve; in fact, it is probably the most important element of preparedness in connection with the Muscle Shoals development.

VII. General summary:

1. The Muscle Shoals project is divided into two parts, namely, the nitrate plants and the hydroelectric developments in the Tennessee.

2. The nitrate plants consist of nitrate plant No. 1 located at Sheffield, Ala., and nitrate plant No. 2 located at Muscle Shoals, Ala., together with its adjuncts, namely, the Gorgas power plant located on the Black Warrior River at Gorgas, Ala., the Warrior-Sheffield transmission line connecting this power plant with nitrate plant No. 2, and the Waco limestone quarry located near Russellville, Ala.

The hydroelectric developments consist of the Wilson Dam.

3. Four main considerations affect the future of the project, namely, (a) Nitrogen preparedness in case of war; (b) Navigation in the Tennessee River over Muscle Shoals section; (c) Hydroelectric power development; (d) Manufacture of fertilizer.

4. Nitrogen preparedness in case of war.

The War Department believes that the best nitrogen preparedness is the development of the commercial business of nitrogen fixation in America. Until such development has reached a dependable status, the War Department believes that United States nitrate plant No. 2 or its equivalent in nitrogen fixation capacity should be available to the Government. From this point of view it would be possible for the Government to dispose of United States nitrate plant No. 1, the Gorgas power plant, and the Warrior-Sheffield transmission line, and to lease or sell the remainder of plant No. 2 under the provision that it would be available in case of need. From this point of view also hydroelectric developments in the Tennessee are not necessary although very desirable.

2. Navigation on the Tennessee River over Muscle Shoals section: The value of navigation development at Muscle Shoals is somewhat doubtful. It has, of course, many advocates. The amount of river traffic at present is small but navigation facilities are poor. With adequate facilities, traffic commensurate with the cost of developing navigation might follow. A fair channel at present exists from the mouth of the river to Muscle Shoals and can be made into a 5 or 6 foot channel with rather small additional expense. Navigation facilities above the shoals to the head of navigation extending beyond Chattanooga are of negligible importance at low water although considerable money has been spent in developing them and work is now under way. This work has been in great measure open channel work which does not endure. Apparently permanent navigation can only be achieved by the creation of necessary locks, dams, etc., in accordance with a broad river policy.

Muscle Shoals is the most serious obstacle to navigation on the river. The completion of Dam No. 2 would fit into a permanent policy and would give 6-foot navigation over 15 miles of the shoals. The No. 3 dam would similarly fit into a permanent policy and would give 6-foot navigation over some 65 miles. These two dams plus the No. 1, which is necessary to connect the No. 2 dam with down stream navigation, could eliminate the Muscle Shoals obstacle.

The No. 2 dam can pay for itself on a power basis, and there can be little doubt therefore as to the logic of completing it.

The No. 3 Dam can not sustain itself as a power proposition at the present time unless some \$6,000,000 are charged off to navigation. There is considerable doubt as to whether development of navigation at the present time is worth this expenditure.

It is to be remembered also that even though Dam No. 2 were completed, it would still be necessary to construct Dam No. 1 at cost of \$1,400,000.

6. Hydroelectric power development: The Muscle Shoals hydroelectric power possibilities are the great natural asset of the region.

The Dam No. 2 is an excellent power proposition on the basis of additional cost and could sustain itself upon basis of total cost. The Dam No. 3 is not a good power proposition at the present time.

The question as to how to best dispose of this power to the maximum benefit of the maximum number is the most serious one connected with Muscle Shoals. Four schemes have been proposed:

First. Lease or sale of Muscle Shoals power project for 100 years with no control by Government over method of using such power or the rate at which it shall be used unless it should happen to come under State or Federal regulation of public utilities, with the exception, however, that an unknown and not stipulated quantity of power shall be used in the manufacture of fertilizers.

Second. Complete retention of control by Government through governmental construction and operation.

Third. Administration of Muscle Shoals power project in conformity with the national policy on water power development as outlined in the Federal water power bill. In this instance power project would be completed by private capital under license from Federal Power Commission and such license would guarantee governmental control of the project and allow Government to recapture at end of 50 years.

Fourth. Partnership between the Government and private capital by which each supplies a part of the capital and shares in profits or losses. Operation is by private capital methods under control by directors appointed by each

pany. In addition the general control system of the Government would apply.

In the natural course of development in the region that can be reached by Muscle Shoals power a market can be expected for the primary power for both dams and steam plant within a period of some three to six years. An additional three to six years would probably be necessary to develop a market for the secondary power of reasonable value. It is, of course, also possible to create new industries in the immediate vicinity of Muscle Shoals to utilize all the power therefrom. If this latter course is followed, many cities and towns to the south and west within transmission distance of Muscle Shoals will be deprived of possibility of obtaining hydroelectric power, as Muscle Shoals is practically the last large undeveloped source of supply available to the region.

It will probably take some two to three years to develop a definite load for the Muscle Shoals plants and it is therefore necessary that a definite policy on disposition of power be developed as soon as possible after determination is made as to what power is to be developed.

7. The question of reducing the price of fertilizers is one of vital interest not only to the farmers but to the entire country. The following summary is repeated from chapter on "Relation of Muscle Shoals to fertilizers":

"Some 55 per cent of the total cost of ingredients in fertilizers is chargeable to nitrogen, 30 per cent to phosphoric acid, and 15 per cent to potash. The cost of ingredients represents about 50 per cent of the cost of fertilizer to the farmer. To collect the ingredients, mix them, and distribute them, including sales expenses, profits, etc., represents about 50 per cent of the cost of fertilizer to the farmers. The transportation costs which are included in the above costs of ingredients, as well as in the collection and distribution costs, amount to some 30 to 40 per cent of the cost of fertilizer to the farmer. The carrier, namely, sulphuric acid, which is used to make ammonia available as fertilizer materials, represents a large item of cost. This sulphuric acid has no other fertilizer value.

"In the matter of ingredients, Muscle Shoals, on the basis of converting the No. 2 plant into a Haber electrolytic plant and with power at 2 mills, and allowing for all costs, including interest, depreciation, insurance, taxes, etc., but not allowing for profits, might save \$32 per ton of nitrogen on the average selling price over the 1900-1914 period, and also the present price, namely, \$281 per ton. This amounts to some 104 per cent of such price. If this saving were all given to the farmer it would amount to a yearly saving of \$1,280,000, or about one-half of 1 per cent of the total fertilizer bill. And if such production forced a reduction of \$32 a ton on all nitrogen consumed in fertilizer, the total saving to the farmer would be some \$5,000,000 to \$6,000,000, or some 2 or 3 per cent of present fertilizer bill.

"In the case of phosphoric acid present knowledge does not justify the statement that any savings can be made because no evidence is available that phosphoric acid can be produced sufficiently cheaply by electro-furnace methods to warrant its use in fertilizer in competition with acid phosphate produced by sulphuric acid.

"In the case of potash no savings can be made with present knowledge.

"In the matter of collecting, mixing, distributing, and selling mixed fertilizer which costs about 50 per cent of the total cost of fertilizers the greatest benefit can be obtained by 'home' mixing by the farmer himself. By this means he might be able to reduce his costs some 10 to 15 per cent. Muscle Shoals might have some beneficial effect in this respect, but it is difficult to measure it.

"Exclusive of rate consideration, transportation charges can be reduced in general by reducing the quantity hauled or by reducing the length of haul. The quantity hauled could best be reduced by increasing the strength of fertilizers and thus reducing the quantity of useless materials transported. This is in great measure dependent upon cheap phosphoric acid, which is a hope but not a reality. Length of haul could be reduced by manufacturing the ingredients and the fertilizers in the near vicinity of their use. If Muscle Shoals could equal the price of present commercial fertilizers or the ingredients thereof, it could affect favorably the price of fertilizers within a radius of about 200 to 250 miles of Muscle Shoals.

"In the matter of carrier, it costs some 20 per cent of the cost of nitrogen to convert ammonia into ammonium sulphate. This costs the farmer, exclusive of transportation charges, some \$7,000,000 per year. With cheap phosphoric acid, some \$5,000,000 of this cost could be saved. But while cheap power is

necessary to cheap phosphoric acid, there is no assurance at present that Muscle Shoals can satisfactorily solve this problem.

"To sum up, on basis of present knowledge, Muscle Shoals does not offer any reasonable expectation of even appreciably reducing the average price of fertilizers to the general farmer of the country. It does offer some hope of reducing the price of nitrogenous fertilizers only to the farmers living within a radius of some 200 miles of Muscle Shoals. It can make available to the fertilizer trade at a price equal to present price and pre-war average some 25 per cent of the present tonnage of nitrogen used in commercial fertilizers. With the extensive and intensive research and development that might go with the establishment at Muscle Shoals of a large and new fertilizer business, important and beneficial improvements in the methods of manufacture, distribution and use of fertilizers might ensue."

If the above summary is reasonably correct, the very difficult question is raised as to whether the best plan for the Government to pursue in an effort to cheapen fertilizer costs is to subsidize in effect some commercial company by selling to that company real property at less than its market value and by leasing to that company at a very low rate of interest for a period of 100 years power developed by Government money, and especially when practically all of such power will cease to be under governmental control.

VIII. Recommendations:

It is my personal belief that the following is the best solution to the Muscle Shoals problem:

1. Congress should establish the policy to be pursued and should require the Executive branch of the Government to carry out such policy. By so doing Congress will avoid the great difficulties incident to the negotiation of any contract.

2. The following policy is recommended:

(a) Dispose of Gorgas power plant and Warrior-Sheffield transmission line in accordance with existing contract with Alabama Power Co.

(b) Sell nitrate plant No. 1 to some responsible purchaser who will operate it in fixing nitrogen or in manufacturing fertilizer. If this does not seem feasible, sell on basis giving maximum return to Government.

(c) Retain, under control of Government as long as this is necessary for national preparedness, nitrate plant No. 2 including Waco quarry but excluding the steam-power plant. Lease or sell the nitrate plant to such lessee or purchaser as will properly guarantee to operate it in fixing nitrogen or in manufacturing fertilizer without impairing its necessary value for national preparedness, and with proper provisions as to limitation of profits developed as a result of governmental help.

Lease or sell the steam plant pertaining to nitrate plant No. 2 on most advantageous terms obtainable, but with suitable guaranties as to the availability of its power equivalent at fair price for either governmental or private operation of the nitrate plant or its equivalent over a reasonable period of time.

(d) Dispose of Dam No. 2, or Wilson Dam, in accordance with the Federal water power act on best terms obtainable in consideration for work already done.

If conditions seem to warrant it, take all or part of payments in terms of power and make this available at reasonable cost to such lessees or purchasers of the nitrate plant as agree to fix nitrogen or manufacture fertilizers, provided, however, that profits developed as a result of governmental help are properly limited.

(e) Appropriate sufficient funds to continue work on Dam No. 2 pending its disposition as outlined above.

(f) Handle Dam No. 3 in accordance with Federal water power act. Grant Government aid only to extent of the value of project to navigation.

3. The above policy could be carried out if section 124 of the national defense act, approved June 3, 1916, were repealed and if proper enabling act were passed.

The CHAIRMAN. In your recommendations you recommend that we sell nitrate plant No. 1.

Major BURNS. That is correct; yes, sir. It may seem as if I am a little inconsistent as a result of those questions you asked a little while ago, but I honestly do not believe that the Government should, directly or by subsidy of any great amount, go into the fertilizer business.

The CHAIRMAN. Now, just assume that to be right for the purpose of the questions I am asking. It seems to me that you lose sight of the fact that the Government is justified—and I think you will agree with me in that—in manufacturing explosives and in keeping itself in time of peace so it can manufacture explosives in time of war?

Major BURNS. Yes, sir. That is correct.

The CHAIRMAN. That puts the Government in this business to some extent. Whether it wants to stay out of private business or not, it is a governmental function to take care of war?

Major BURNS. Yes, sir.

The CHAIRMAN. It so happens in making explosives or having machinery to do it, incidentally, and with comparatively little change they can make fertilizer. So is it not a little bit different, the Government being justified to mix into this business because of a war proposition, that it can also at the same time utilize its machinery and its products for the purpose of using the machinery in time of peace, but always keeping it ready for a war emergency?

Major BURNS. Here is the way that appeals to me: I think the Government must assure itself of proper protection of the country in time of need, but I think it ought to put maximum dependence on commercial development. If it can accomplish its purpose through commercial development, then I think that is the proper solution. If it can not accomplish its purpose through commercial development, then I think the Government itself should go into the business.

The CHAIRMAN. Would you follow that through to such an extent as to say that the Government ought not to build its own battleships—that they ought to be built by somebody else?

Major BURNS. Of course, it does build a great many of them.

The CHAIRMAN. I know it does; but do you think the Government is not justified in building battleships? We can get those built by private parties always.

Major BURNS. Of course, I doubt very much if you would get as efficient battleships in the long run if you built all the battleships by commercial companies.

The CHAIRMAN. I doubt it, too.

Major BURNS. It is therefore practically necessary to have them both work on them.

The CHAIRMAN. Some people believe the Government ought to build all the battleships, and I belong to that class for several reasons, and one of the reasons is that whenever you commercialize a weapon of war you give a great inducement to people to go into the business as a financial consideration and you get people urging on war that otherwise would be opposed to it.

Major BURNS. Yes, sir. There is no doubt about that.

The CHAIRMAN. Another thing in your recommendation, Major, that seems to me does not bear out your own testimony fully is the disposition of plant No. 1, which would mean that the Government would cease its investigations about the development of machinery to get nitrate from the air. Don't you think the Government is justified in maintaining laboratories and experimenting, confining it entirely to war considerations now, as a matter of national defense, to cheapen the method of getting nitrogen out of the air?

Major BURNS. Well, I think they are fully justified in carrying on that business so long as it is necessary for nitrogen preparedness, but I personally believe that we have got a reasonably satisfactory solution of the nitrogen preparedness problem right to-day.

The CHAIRMAN. In a way we have. But I know you will agree with this proposition, that the expense of it is very great, and the possibilities of investigation are very inviting to reduce it; and ought the Government not try to reduce it so as to save the expense of war if it should come?

Major BURNS. There is no doubt but that the Government ought to wage war not only so that it will win but also as economically as possible. We can not escape those principles. But if the Government goes into a commercial field it prevents commercial development, and to that extent it may harm the country rather than help it.

The CHAIRMAN. I admit that to some extent, but at the same time, if it was necessary or desirable as a war proposition to manufacture any article, then it is likewise desirable to manufacture it as cheaply as possible, and if it is necessary to make experiments in order to do it, even though it is expensive, they are justified in the expense, and is not that particularly true when it happens that the same product that they are going to try to cheapen for war

purposes is one of the principal ingredients in fertilizer that all the people admit it would be extremely desirable to cheapen? I think the Government would be justified in operating plant No. 2 outside of the war proposition just for the purpose of experimenting on a practical commercial scale to see whether it could not cheapen fertilizer, and if it develops a method let it be free and open to anybody to follow it. It seems to me, either as a war proposition or as a peace proposition, it ought to somewhere—if not there, at some place—carry on very extensive investigations to see if it can not get a cheaper method of getting nitrogen out of the air, both because it has to do with national defense and because it is a very great necessity for all the people of the country, not the farmer alone but everybody who eats, to cheapen the cost of fertilizer.

Major BURNS. Of course, I think myself that governmental research is of extreme importance, and I think the Government can very well afford to spend large sums of money every year in governmental research.

The CHAIRMAN. Is not plant No. 1 one of the most desirable places, since we have the steam plant there, we have all the buildings there, houses for the fellows to live in, and everything? Is not there the greatest opening for the Government to make that kind of research?

Major BURNS. You could certainly do research work there very easily.

The CHAIRMAN. Take this ammonia. You are a chemist.

Major BURNS. I am a sort of a half chemist.

The CHAIRMAN. You have been in the employ of the Government ever since you completed your military education?

Major BURNS. Yes, sir.

The CHAIRMAN. And you have been devoting yourself to research in this line to a great extent, haven't you?

Major BURNS. Of course, I have been associated with research problems that have come up, but I myself have not worked very much on them.

The CHAIRMAN. You are very familiar with all the methods and all the different systems?

Major BURNS. In a general way.

The CHAIRMAN. Do you think the Government is justified in paying you to devote yourself to that kind of business? Has not that helped to bring about your own energies and your own efforts?

Major BURNS. I don't argue against your principle of governmental research, because I thoroughly agree in it.

The CHAIRMAN. Regardless of how we may disagree on everything else, it seems to me there is a great opportunity for the Government to carry on research work at No. 1. We have got to do this research work on a large scale, because you know what shows up well in a laboratory does not work out, lots of times, in quantity production. There we have the machinery and everything and it is admitted that the Haber process is the one that is inviting. The whole world admits that the improvement will come in that process.

Major BURNS. Consider the case of the Haber process. We ourselves worked hard for the purpose of perfecting the Haber process, and we had a large number of designs drawn up, and we had a large number of schemes in mind, but while we were doing it the plant at Syracuse was constructed and put in operation and proved to be successful. To have carried out our ideas would have cost in excess of \$1,000,000 and we finally decided that we were not justified in recommending the expenditure of that amount, especially as we could not have continued the operation of the plant for more than a few months.

The CHAIRMAN. The Syracuse plant is not successful on a large scale, as I understand it. It would not be able to make fertilizers.

Major BURNS. As these figures seem to indicate, you can not make ammonia for use in fertilizers by the Haber-Bosch system, which is what they have up there, but with the Haber electrolytic it looks as if there is a chance.

The CHAIRMAN. Yes, and the hope is that the Haber electrolytic, if you started on that inviting field, you will discover something new and cheapen the process.

Major BURNS. Yes.

The CHAIRMAN. Why should we throw away all this property and sell it? It will have to go as scrap, nearly. Why should we throw it away when both as a peace proposition and as a war proposition we have right before us there an opportunity to go into this kind of work on a large scale, and it is conceded that improvements are necessary? As I get it from your testimony and from other scientific men who have testified, however disagreeable the fact is, I can

not throw it away, and it is disagreeable, and I would much rather the result were different, because I would like to do something for the people on the fertilizer line; but now it is your judgment and it is the judgment of other scientific men who have appeared before us, all of them except those that have some definite interest in the result of our deliberations. It has been the consensus of judgment of all of those scientific men that unless we do have some improvement the possibilities of cheapening fertilizer are very small.

Major BURNS. That is correct. Senator, in writing up this summary, I studied over the fertilizer question a long time. As to how to handle the fertilizer end of it was a thing that I could not convince myself on. I feel something has got to be done to help solve the fertilizer problem, and I have come to the conclusion that you will get further if you give the necessary incentive to private capital to do something, and I have tried to include a definite incentive along this line in my recommendations.

The CHAIRMAN. Private capital has the incentive. He can get his patent.

Major BURNS. In my scheme the Government would turn over to private capital the power taken from Dam No. 2 at such prices as the Government should name in order to spur these people along, and it would be a very great help in the Haber electrolytic process, for instance, if you could sell them power at about a mill, as our figures indicate that they would have a big margin with such power. In addition, the nitrate plants could be disposed of at a price that would furnish an additional incentive to assist in the problems of fertilizers and nitrogen fixation. In other words, they are the possible incentive which is included in my recommendations.

The CHAIRMAN. That may be; but I have a great deal of doubt about the Government going to all the expense and letting somebody else have the possibility of getting the thing patented or otherwise getting a monopoly of it. If the Government is going to furnish the money and the power, it has got as good scientific men as anybody else. Why not let the Government go on with the experiments—they are going to cost a good deal of money, and I doubt whether private parties would do it—and if they discover something, open it up to the world and let everybody have it.

Let me ask you, Major—you come in contact with scientific men, and I am speaking now of chemists and engineers and geological men, of scientific men in the Government as distinguished from what I might call political men, like Senators, Congressmen, Cabinet officers, and the President. You have come in contact with them. Have you found that they are just as able and just as competent and just as earnest as fellows that are working for the Standard Oil Co. and other people, and don't you think they are a remarkably fine set of men?

Major BURNS. Yes, sir. I think they are second to none, so far as those qualities are concerned.

The CHAIRMAN. Could we not trust those men to experiment for us?

Major BURNS. Here is one point, Senator, with reference to Government operation that is of a great deal of importance, and that is that the incentive does not exist so much in Government operation as it does in private-capital operation.

The CHAIRMAN. Is that true of a chemist?

Major BURNS. Yes, sir. It is true all along the line.

The CHAIRMAN. Take the research laboratories, for instance.

Major BURNS. We have, as you know, been working on nitrogen fixation problems for a great many years.

The CHAIRMAN. Would you close that up?

Major BURNS. No, sir; I would not close it up, but it is an expensive thing to carry on, and you won't get as much out of it per dollar expended as I think private capital would.

The CHAIRMAN. Why does not private capital do it? There is no reason why private capital should not go into it. There is nobody wants to prevent them.

Major BURNS. They are in it. They are in those problems. They are working on them.

The CHAIRMAN. I know they are in many ways.

Major BURNS. Take the American Cyanamid Co., for instance, in its efforts to find products developed by the cyanamid process that could live under market conditions. They have had research work going on for years. They have carried on investigations with phosphoric acid for years, as Mr. Swann has.

Another great trouble with governmental operation is that there is no way in which the ideas can be developed outside of the laboratory in order to determine whether such ideas have commercial value.

The CHAIRMAN. There is just where you get into my proposition. That is the reason why I want to hold nitrate plant No. 1, so you can do that very thing—operate it on a large scale as distinguished from a laboratory test, to see whether it will work out in actual practice.

Major BURNS. Of course, your argument there is very sound. I do not believe a laboratory experiment is of much use unless it is carried on and tried out in some plant on a commercial scale.

The CHAIRMAN. That is the reason I want to keep nitrate plant No. 1. The production there would not be a drop in the bucket, but if we cheapen the product we would not patent it but would invite everybody to use it, not only in this country but all over the world.

Major BURNS. I believe your argument with reference to research is sound. If you are going to do research work, you have to do it not only in a laboratory but combined with a plant that is operated on a sufficiently large capacity to get into commercial practice.

The CHAIRMAN. I have no doubt of that, because so often we find in consultation with our experts, and especially during the war I was in consultation with a great many of them, that the trouble was that they would get something that would look all right on a laboratory scale, but when it was tried out to see whether it would work on a big scale or not they would have to turn it over to some private party to see whether it would work or not, and this is what happened sometimes. They would have laboratory tests, and take some big corporation that was in that line of business, and if they found that they could suppress it and make more money by continuing on, especially if they had a monopoly of something, they would suppress it. It would be a matter of dollars and cents with them. They oftentimes try to kill things unless they can get a patent on it. If they can get a patent and shut other competitors out, all right. If the Government does that and makes the development, everybody gets it.

Major BURNS. There is one thing with reference to the Haber electrolytic process, Senator, that I would like to point out, and that is that you could probably take care of it as well at plant No. 2 as you could at plant No. 1.

The CHAIRMAN. The only objection I would have to that, Major, would be—you may be entirely right about it—that I have feared if we undertook to do that at plant No. 2, and there was some new process, some new modification by which you would have to take out machinery and put in new, you might have to dismantle part of No. 2 and have the thing rebuilt, and if war suddenly broke out you would not be able to use even No. 2.

Major BURNS. I had in mind that you could do that without in any way interfering with plant No. 2.

The CHAIRMAN. Of course if you could, that would be all right. I realize No. 2 plant down there is an expensive way of getting nitrogen out of the air.

Major BURNS. Yes; it is.

The CHAIRMAN. Unless it is improved in some way the farmer can expect no benefit out of it in time of peace, I am afraid.

Major BURNS. I don't think he can.

The CHAIRMAN. But I would be just as careful to preserve that just as it stands now as I would keep a battleship. If war broke out to-morrow that would be one of our mainstays, especially if it was with a power that had a good navy. So I would not want to dismantle it or do anything with it until we had first demonstrated that whatever change we contemplate is right.

Major BURNS. There is a lot of merit to your argument. There is no doubt about that.

The CHAIRMAN. For the purpose of getting into the record the geography of the situation I want to ask you a few questions. The committee all understand it, but anyone reading the testimony may not understand it, and it might help them in considering it.

Now, at the foot of Muscle Shoals are located two towns, one on the north side and one on the south side of the river?

Major BURNS. Yes, sir; Florence on the north side and Sheffield on the south side.

The CHAIRMAN. Those towns are connected by bridge?

Major BURNS. Yes, sir.

The CHAIRMAN. From those towns how far is it up the river to Dam No. 2?

Major BURNS. About three miles from the bridge up to Dam No. 2.

The CHAIRMAN. How far from Dam No. 2 to Dam No. 3?

Major BURNS. It is approximately 15 miles from Dam No. 2 to Dam No. 3.

The CHAIRMAN. What direction from Sheffield is nitrate plant No. 1.

Major BURNS. It is about a mile south and west of Sheffield.

The CHAIRMAN. Nearly south, is it not?

Major BURNS. Yes, sir.

The CHAIRMAN. Where is nitrate plant No. 2, then, with reference to Sheffield and nitrate plant No. 1?

Major BURNS. Nitrate plant No. 2 is about 4 miles northeast of Sheffield and about 5 miles northeast of plant No. 1.

The CHAIRMAN. In other words, it is up the river from Sheffield?

Major BURNS. Yes, sir.

The CHAIRMAN. Where is the Waco Quarry?

Major BURNS. The Waco Quarry is near Russellville, Ala., about 26 miles south of Sheffield.

The CHAIRMAN. The Dam No. 2 will back up the river and make it navigable up to the location of Dam No. 3?

Major BURNS. Yes, sir.

The CHAIRMAN. And Dam No. 3 will make the river navigable about 65 miles farther?

Major BURNS. Yes, sir.

The CHAIRMAN. In order to make navigation available it would be necessary to build what is known as Dam No. 1?

Major BURNS. Yes, sir.

The CHAIRMAN. That has no power connected with it?

Major BURNS. No, sir.

The CHAIRMAN. It is entirely a navigation proposition?

Major BURNS. Yes, sir; just a small dam connecting the island—

The CHAIRMAN. Connecting the island in the river with the north bank of the Tennessee River, and is right near the bridge that connects Sheffield and Florence?

Major BURNS. Yes, sir.

The CHAIRMAN. You have given the railroad mileage, Major, at the different locations. How much standard-gauge railroad have we at Waco quarry and nitrate plant No. 1 and nitrate plant No. 2?

Major BURNS. There are 49.6 miles of standard-gauge track at plants 1, 2, Waco quarry, and Gorgas.

The CHAIRMAN. Now eliminate Gorgas from that. How much have we? Or you can do it by saying how many miles we have at Gorgas.

Major BURNS. Of this amount 1 mile only is at Gorgas.

The CHAIRMAN. Then it is between 48 and 49 miles of railway, standard gauge, that we own outside of what we own at Gorgas and outside of what we own at the dam?

Major BURNS. Yes, sir.

The CHAIRMAN. How much do we own at the dam?

Major BURNS. I have not got that figure. I will have to get that for you and put it in the record. I will put it in the record when I revise my testimony.

The CHAIRMAN. How many locomotive engines altogether does the Government own in connection with Muscle Shoals?

Major BURNS. There are 13 railroad engines belonging to the two nitrate plants, including Waco quarry, of which 6 are now on loan to the Corps of Engineers at the Wilson Dam.

The CHAIRMAN. The Wilson Dam as such does not own any?

Major BURNS. I don't know whether they own any or not, Senator, but we have loaned them six. But I will look that up.

The CHAIRMAN. It is important to know, if we accept the Ford offer, whether we would get—well, it is not of much importance, because they would wear out in a hundred years. How many?

Major BURNS. That question I can not answer. I will give you that later.

The CHAIRMAN. How many railroad cars, including the whole thing, everywhere?

Major BURNS. We have everything here for nitrate plant No. 2, because that is the way the question was asked in your letter.

The CHAIRMAN. They all go. It does not make much difference whether they are leased or sold.

Major, of what use is the Gorgas plant over on the Warrior River to the Government of the United States now? What use is it to us? Is it a necessity?

Major BURNS. No, sir. Of course nitrate plant No. 2 would require 100,000 horsepower if we had to operate it, and of that amount we have only got 80,000 at nitrate plant No. 2.

The CHAIRMAN. If war
we had to depend on the p¹¹
we have there would not be

Major BURNS. No, sir.

The CHAIRMAN. We would.

Major BURNS. Yes, sir.

The CHAIRMAN. We could

Major BURNS. Yes, sir.

tion for hanging onto the G

The CHAIRMAN. Is this ti

in mixing up in that connec

use in the construction of th

Major BURNS. And to open

The CHAIRMAN. You would
during war?

Major BURNS. Of course t
No. 2 nitrate plant.

The CHAIRMAN. I understand that, but if the Government owned the
and nitrate plant No. 2 it would not have any use to go to Gorgas and ge
power, would it?

Major BURNS. None whatever; no, sir.

The CHAIRMAN. So that the practicability of having Gorgas, which is over
in another river valley, tied up, is of no permanent value to the United States
if it has power of its own?

Major BURNS. Not that I can see; no, sir.

Mr. LEVERING. Senator, could I make a suggestion?

The CHAIRMAN. Yes.

Mr. LEVERING. That the branch running from plant No. 2 to the quarry should
be kept by the Government, because they ought to have that if they ever have
to operate the quarry in a hurry. That 26 miles of transmission ought to
belong to the Government because it is of no use to the Alabama Power Co.,
and it is of very great use to the Government.

Major BURNS. Your point is very well taken from the standpoint of assuring
a supply of power for Waco quarry.

The CHAIRMAN. Let us get that in the record. Waco is on this line—

Major BURNS. Yes, sir.

The CHAIRMAN. Which runs over from Gorgas?

Major BURNS. Passes by Waco.

The CHAIRMAN. Passes by Waco, and you operate that quarry from that
current?

Major BURNS. Yes, sir. That is correct.

The CHAIRMAN. If the Government sold the transmission line and wanted to
operate Waco, it ought to retain, then, the transmission line from Waco to
Sheffield, which would be about 26 miles of it?

Major BURNS. It ought to assure itself of a supply of power. But of course
there would be a question as to whether you would be justified retaining the
transmission line for the small amount of power used at Waco. As I recall
the figures, you use about 750 horsepower at Waco, and it is a question of
economy as to whether you would be justified in holding the transmission line
for such a small amount of power.

The CHAIRMAN. How would you operate Waco?

Major BURNS. You might be able to establish a steam plant to produce 750
horsepower in time of need.

The CHAIRMAN. If you are going to operate plant No. 2 even to make fer-
tilizer, you would need Waco?

Major BURNS. By the cyanamid process there is no doubt but what you
would need power to operate the quarry. There is doubt as to what is the
most economical way of getting that power. It is a question of whether you
would be justified in keeping the transmission line for that purpose or whether
some other solution might not be the more economical.

Mr. LEVERING. You have already got it.

The CHAIRMAN. Even if that was disposed of, the Government could con-
struct another one from Waco over.

Major BURNS. Yes, sir; or if it were sold you might be able to sell under
the guaranty that that power would be available at the Waco quarry.

The CHAIRMAN. Not the power but the use of the transmission line.

Major BURNS. Yes, sir; the use of the transmission line.

LE SHOALS.

AY, JUNE 23, 1922.

Major BURNS. It is about a mile south and

The CHAIRMAN. Nearly south, is it not?

Major BURNS. Yes, sir.

The CHAIRMAN. Where is nitrate plant No. 1 field and nitrate plant No. 1?

Major BURNS. Nitrate plant No. 2 is about and about 5 miles northeast of plant No. 1.

The CHAIRMAN. In other words, it is up the

Major BURNS. Yes, sir.

The CHAIRMAN. Where is the Waco Quarry?

Major BURNS. The Waco Quarry is near R south of Sheffield.

The CHAIRMAN. The Dam No. 2 will back up up to the location of Dam No. 3?

Major BURNS. Yes, sir.

The CHAIRMAN. And Dam No. 3 will make the farther?

Major BURNS. Yes, sir.

The

The CHAIRMAN. I think very much money, but we

MUSCLE SHOALS.

FRIDAY, JUNE 23, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris (chairman) presiding. Present: Senators Norris (chairman), Capper, Keyes, Ladd, and McKinley.

The CHAIRMAN. The committee will come to order.

Mr. Wells is here this morning at my request. I have known Mr. Wells for a great many years. He was formerly in the service of the Government, when Mr. Pinchot was Forester, and he is a recognized authority on conservation problems. When I found he was in the city I invited him to come before us on this proposition. I do not know how much consideration he has given to any of the questions involved here, but I do happen to know that years ago, when the Muscle Shoals proposition was up in the House, he had a great deal of information in regard to it.

Now, Mr. Wells, proceed in your own way.

STATEMENT OF MR. PHILIP T. WELLS, ATTORNEY AT LAW, MIDDLETOWN, CONN.

The CHAIRMAN. First, for the record, tell just who you are.

Mr. WELLS. I am a lawyer. I reside in Middletown, Conn. I have been interested in conservation matters and in water power particularly for 15 years. I am now president of the Connecticut Forestry Association.

The CHAIRMAN. Have you any personal or financial interest in any way, excepting as a citizen, in Muscle Shoals?

Mr. WELLS. None whatever, Senator. I was, from 1907 to 1910, chief law officer of the Forest Service, and in that capacity had also administrative charge, under Mr. Pinchot, of water-power matters in the Forest Service.

During those years we developed a system of leasing water-power sites in the national forests. I had charge of that work, and carried on negotiations with the applicants for leasing, and with those who contended we had no legal authority to lease. Then when Mr. Pinchot left the public service I was counsel for the National Conservation Association, and continued to interest myself, from the public point of view, in the water-power legislation then pending.

I will also say that in the years 1907 to 1910 I was counsel to the power committee of President Roosevelt's Inland Waterways Commission, and in that capacity it was my business to scrutinize and advise upon all legislation for the development of water power in navigable rivers, and I negotiated with water-power men advocating legislation of that kind.

From 1911 to 1913 I was chief law officer of the United States Reclamation Service in the Interior Department. I was in the office of the secretary, Mr. Walter L. Fisher, of Chicago, and was his special adviser upon conservation matters in general, and upon water power in particular; and in that office I took part in framing the water-power-leasing policy on the public lands, and also I negotiated with applicants for water-power privileges. Particularly I remember negotiating the lease to the Great Falls Power Co. of Montana for the electrification of the Pacific extension of the St. Paul Railroad.

I again left the Government service in 1913 and was in the practice of law in Washington here for four years thereafter. During that time I continued to interest myself in conservation legislation, and particularly water-power legislation, and was in frequent conference with Senators and Representatives who were advocating legislation satisfactory to the conservation point of view, which ultimately resulted in the water power act of 1920. I also appeared before committees of the House and Senate on water-power bills.

During all those years there was a very hard and persistent fight on the part of ourselves to establish certain principles of water-power policy. We thought that wherever the Government had the say so as to water-power development it should insist upon the application of these principles. We developed these principles first in the national forests and then extended them to the navigable rivers. We were bitterly fought by all the water-power people at first, and later some of the water-power people conceded the justice of our claims and were for a time willing to come in under them. It was my duty, as I say, to negotiate water-power permits or leases, to scrutinize and help formulate legislation, and to negotiate with water-power men who advocated legislation of one kind and another.

In the course of this duty I drafted the two vetoes which President Roosevelt sent in on water-power bills in 1908 and 1909, basing his reason for vetoing them on the fact that they did not conform to these principles.

That struggle went on not only in Congress but before the public. There were various bodies organized on one side or the other to debate this subject and influence public opinion. Among others was the national conservation congress, the public lands convention held in Denver, and I think other conventions held at various points around the country. The matter was thoroughly debated there. As I say, we found ourselves opposed at first by all the water-power people, later by a majority of them, and that majority controlled the general attitude of the water-power industry. Among the most persistent opponents was the Alabama Power Co. at that time. I well remember that we were denounced as usurpers of State authority by many members of the Alabama delegation in Congress, and the impression I retain is that Alabama had turned over practically all her water-power resources, so far as she could, to that corporation, and the Alabama Representatives here as a whole, as I remember it, were opposed to us in trying to put any control upon water power by Federal authority. That was notably so with respect to a veto of a bill to license a dam on the Coosa River, which veto was sent in by President Taft in the latter half of his administration, acting, I believe, upon the advice of Secretary Stimson, of the War Department, and Secretary Fisher, of the Interior Department. That veto was very vigorously denounced by the Alabama Representatives in both Houses on the floor of Congress and also at the national conservation congress held in this city, I think in the fall of 1913.

The first sign of the yielding of the water-power people, so far as I recall, to our contention was in the case of the Connecticut dam bill in the latter half of the Taft administration. At that time there was a proposal to develop the water power above Hartford at what is called Enfield Rapids, where there is, I am told, about 30,000 horsepower to be developed. The proponents of that scheme came to an understanding with Secretary Stimson, of the War Department, that they would accept the principles of what we call the Roosevelt water policy, and a bill especially designed for that development was introduced in Congress and debated in the Senate. It was defeated by a combination of the southern and far-western Senators who opposed these principles.

Now, I will add that I am confident, although I have not examined the record since, that the Alabama Senators and Representatives who denounced the Coosa Dam bill veto were among those who voted against the Connecticut dam bill. I don't remember all the personalities connected with those negotiations, but I have a recollection which, if it is wrong, I would like to have corrected, that Mr. Worthington was one of those who in all this controversy opposed us, and I think acted for the Alabama Power Co., though I would like to be corrected if I am wrong about that. I notice that he is apparently now acting for Mr. Ford; and if so, I think he is entirely consistent with what he did before and is upholding the views which he then held about public policy.

The CHAIRMAN. When you refer to Mr. Worthington you mean the gentleman who has appeared before this committee?

Mr. WELLS. Yes, sir; I think he is the same man. If I am wrong about that I want to be corrected. But it seems to me significant, and bears out my contention, that this proposition is like the other proposition, and he is consistent in his attitude.

There were certain principles of that policy for which we contended all those years. The first one was that there should be no grant of water-power privileges for more than 50 years. The second was that there should be some rental paid to the Government for the raw water power. The third was that there should be public control of the rates charged to consumers and the service rendered to them by the lessee. Then it was always assumed that the lessee was going to risk his own money in building the works and take the risk of any disaster that might come to them. There was the further principle which we contended for, and which was finally embodied in the water power act, that excess profits, if any existed after regulation of rates and service, should be paid to the Government.

Now, the Ford proposal seems to me to violate every one of those principles. There is not pre-ense of any rental for the raw water power. There is no 50-year limit. There is no proposal that either the Federal Government or the Alabama Power Commission, if there is such a thing, can control the rates that Mr. Ford will charge or the services that he will render to consumers. There is no provision that if he makes excessive profits those profits shall go to the Federal Treasury.

In all those things it is just exactly like what the Alabama Power Co. used to demand in the old days. But it goes further than that. It asks a vast contribution from the Federal Treasury to the cost of Mr. Ford's plan. Now, that idea is not entirely novel. The first time such a proposal was made, to my knowledge, was in behalf of some Alabama people before the power committee of Roosevelt's Inland Waterways Commission at a session which I was attending as counsel of that committee, but the proposal then was a modest one compared with this, so far as Government expenditure was concerned, and it never got anywhere.

Then this proposal asks the Government to give Mr. Ford free insurance for a hundred years against flood and earthquake.

The CHAIRMAN. That is not quite true. He pays \$35,000 per year on one dam and \$20,000 per year on the other.

Mr. WELLS. As I compute it, Senator, since his pretended interest payments are not a real 4 per cent on the Government investment, I have charged back—

The CHAIRMAN. That might more than counterbalance it. Of course, he does not pay quite 4 per cent.

Mr. WELLS. Exactly; but the public is led to believe that he does.

The CHAIRMAN. I know they are; but the offer particularly states that he shall pay to the Government \$35,000 a year for maintenance of Dam No. 2 and \$20,000 a year for maintenance of Dam No. 3, and the Government, in consideration of that payment, guarantees to repair and keep in repair and maintain the dam, outside of the machinery end of it.

Mr. WELLS. Yes, Senator, I have not overlooked that, but I am glad you called my attention to it.

This offer goes before the country as a proposal on the part of Mr. Ford to pay 4 per cent on the Government investment. When I read the contract, of course it is not so, but that is the way the country has got it, and therefore I put the \$35,000 in as part of the interest in my calculation on the United States investment.

The CHAIRMAN. It does not make it then, does it?

Mr. WELLS. It does not make anything like 4 per cent then. Therefore I say the offer means free insurance. Moreover, though I am not an engineer, I have consulted with engineers, and water-power engineers in particular, in all these years, and the \$35,000 per year is ridiculous not only as an insurance premium against disaster but it is ridiculous as a maintenance charge against ordinary wear and tear, if I am correctly informed. However, I can not say that with authority, because I am not an engineer.

I have already said, perhaps, what I had to say about the false notion that has got abroad that the United States is to be paid the full interest at 4 per cent on its investment. As a matter of fact, it is to be paid nothing of the sort. I have not computed it on Ford's final offer. On the first offer I computed it as about 3 per cent or perhaps $3\frac{1}{2}$ per cent. I forget the precise fraction. That is counting in all his amortization and everything else as interest.

Now, I never yet have seen a proposition made to the Government that was as outrageous as this in water-power matters. As I say, for many years I dealt for the Government with water-power men demanding legislation, and I must say that all the Wall Street men, etc., as we call them, that I have

dealt with are pikers in comparison to Mr. Ford in this matter. If this thing is accepted, it will be unfair to the water-power men who, after this fight, have accepted the water power act. It makes the water power act of no value. Taking human nature for what it is, it is practically certain that every one of them will demand as near to what Mr. Ford gets as their acquisitiveness and assurance will let them.

The CHAIRMAN. In case we should do a thing of that kind we would be inviting just such a result, would we not?

Mr. WELLS. Certainly.

The CHAIRMAN. It would mean the scrapping of our former policy and establishing of a new one on a new basis.

Mr. WELLS. It means absolute destruction of what we fought for for the people here for 15 years and won. That is why I am here.

In the Ford proposal there is the inducement held out of cheap fertilizer. I can not find in the offer any binding contract to make fertilizer at all events, much less to make them cheap. I have no doubt that Mr. Ford, if he gets this thing, will use a small fraction of the total power installation with which he will run one of the nitrate plants for making fertilizer, if he can do it at a profit, and that he will endeavor to cheapen the product; but I do not see anything in the contract that compels him to do it if he finds it is unprofitable, and, of course, it follows that he is not compelled to make them cheaply. He does promise to restrict his profits on that branch of the enterprise to 8 per cent, but there is no standard as to how that 8 per cent is to be calculated. If the Ford proposal were to be accepted, I think that ought to be written into the bill, and that the cost should be computed on some established basis of value of the plant, and not the value that Mr. Ford puts upon it when he wants to buy it, at less than junk value, and upon the value of the water power that he has to use.

As contrasted with the Ford offer, I have examined, Mr. Chairman, your bill, at your request. The Norris bill, which I refer to, is Senate bill 3420, and that bill proposes that the works shall be completed and operated at Government cost. There are two good reasons for that. One is that the whole matter began and still rests in military necessity. The proposition is a munitions proposition first of all, and all the proposed legislation recognizes that. Everything else is incidental.

In the second place, we have made a big investment of somewhere in the neighborhood of a hundred million dollars there; and we have a right to protect that investment, though ordinarily we might not want the government to go into the power business. The Norris bill gives preference in the disposal of the surplus power to cities, counties, and so forth. If there is any profit made out of it it goes to the Treasury of the United States, where it belongs.

The bill provides for storage so as to make the whole great installation at the power site available all the year round, so far as practicable. It also proposes to assure the manufacture of fertilizer or fertilizer products, and their sale as cheaply as practicable. All those things are certain under the Norris bill. The Norris bill is, therefore, entirely consistent with the water power policy for which we have fought all these years, and the only apparent inconsistency is that it is to be a Government-operated plant, and the abundant reason defending that exception is that the whole thing is a military necessity, and further, that we have an enormous investment there which we must protect.

I think the Norris bill could be improved in certain respects. I do not notice any provision in it for an appropriation, but the practice with respect to appropriations is quite radically changed since I was familiar with it, and it may not be necessary to have such a provision in the bill.

The CHAIRMAN. I think, if I might interrupt you there, Mr. Wells, it would be necessary to have a provision of that kind, or some other provision for its getting capital will be necessary in the bill. It might be provided, and I have had this in mind, by an authorization to the corporation that is set up, to dispose of the Gorgas plant, for instance, which ought to be disposed of, and such other property as may not be necessary—and there is a great deal of that in the management of the concern—there is a great deal of property there amounting, I think, to more than a million dollars—perhaps \$2,000,000—that was used in the construction of all this property, not now needed, and it could just as well be sold, at least after the dam is finished.

Mr. WELLS. Then I think that some procedure for condemning the storage sites should be incorporated in the bill, rather than leave it in general terms; and the same for the assessing of storage benefits upon existing power plants whose capacity would be increased by the water stored at Government expense.

Then, as to the chemical corporation which is to be owned by the Government, and which is to be the means of operating this project, I personally would rather see a single head than three directors. I think you would get better results with a single director, with a salary limit of \$15,000, rather than three at \$7,500 each. I don't know whether it would be possible to appoint the director in any other way than by presidential appointment on advice and consent of the Senate, but whenever we see a provision for appointment by the President, by advice and consent of the Senate, we begin immediately to think of what we call politics, and politics ought to be kept absolutely out of this thing, and the bill clearly shows that such is its intent. There are very excellent provisions in the bill as to the other employees to prevent their being appointed or retained or promoted on political considerations, or for any other reason than their efficiency. I don't know whether that obstacle could be gotten around or not, as to one director or the three directors, and it occurs to me that possibly a requirement of some certification of his qualifications to the President, by recognized scientific and business administration bodies, might get over the difficulty. I have not thought this out, but possibly if he were certified by the Carnegie Institution and the School of Business Administration of Harvard University, or any other university—they happen to have one there that I know of—that something of that sort would get over the difficulty, and then let the President appoint on that recommendation. You might in that way get better results than giving it the course of a political appointment.

I have some doubt about the removal by resolution of the House and Senate, for the reason that it might be considered an invasion of Executive power by the legislative. I have not worked that out either, but that occurs to me in reading the bill.

The CHAIRMAN. Now, Mr. Wells, on that point don't you think there ought to be some power lodged somewhere to remove these officials?

Mr. WELLS. Oh, there must be; unquestionably.

The CHAIRMAN. That state of affairs must exist some place.

Mr. WELLS. Absolutely. They ought to be removable.

The CHAIRMAN. Of course, we don't want them removable at the will of the President, for instance, because that would get it back into politics, or might. It is possible, of course, for a majority in the House and Senate to remove for political purposes, but to my mind it is hardly probable that the House and Senate could command those two bodies in that sense, using them for political purposes. There would be such a diversity of opinion and such strong knowledge of the thing on the part of the public, that no majority would dare take the condemnation of public sentiment that would follow the doing of a thing of that kind.

Mr. WELLS. I am glad to hear you say that, Senator, in view of certain things that have been noted in the public press lately in the way of demands for removal of officials. I don't know myself. My thought is directed wholly to the constitutionality of the device. I recall the controversy on that subject which we find in the history books, especially as I recall it during the Johnson administration, with respect to the attempt of Congress to prevent the removal or control of General Grant by the President. I have not examined the question with care, but the doubt is suggested.

Then to strengthen the nonpartisan and nonpolitical character of the corporation, it seems to me it would be well to bar the director and the employees from all open party activities. They ought not to take the stump or attend conventions or do anything of that sort, which is very useful work that somebody has got to do, but that won't mix with this business.

Now, as to the sale of fertilizers. I don't know whether it would be possible to restrict that to sale for cash only to farmers and cooperative organizations of farmers direct. If it were practicable to do that, I think it desirable.

I also think that there ought to be accounts set up for the business, giving a book value to the investments and the various parts of it, and, since we are proposing this as a substitute for Mr. Ford's offer, that we give a book value equivalent to Mr. Ford's offer. Mr. Ford's offer is \$5,000,000 for the two nitrate plants and a lot more stuff that has cost the Government \$85,000,000. So for this nitrate corporation I would propose that that should be entered on the books of the Federal Chemical Corporation as \$5,000,000.

And so Ford's estimate of \$40,000,000 for the completion of the power dams. In that he does not propose to compensate the Government at all for what it

has already spent, something under \$20,000,000 on that part of the enterprise. So I propose that the books of the Chemical Corporation should enter the value of the dams at the figure that Mr. Ford fixes, namely \$40,000,000.

Then I think there should be a provision that the munitions delivered to the War Department should be credited to the Chemical Corporation at a fair price and also the service rendered by the corporation to navigation, whatever it is, big or little. All these things should be embodied in the bill, and the bill should require the corporation to endeavor, so far as practicable, to operate the plant at a profit on that investment.

Now, I see that the bill provides that the main office shall be at or near Muscle Shoals. I do not know whether that would be the best place. It is quite likely that it would. On the other hand, it might be that the main office—the director's office—should be near the market. I have no knowledge of the fertilizer market and do not know about that.

The CHAIRMAN. That is pretty well located, Muscle Shoals, to the fertilizer market.

Mr. WELLS. Well, I do not know about that.

That is about all I had in mind to say, Senator.

The CHAIRMAN. Have you any questions, Senator Keyes?

Senator KEYES. No, sir.

The CHAIRMAN. I will say, Mr. Wells, that while I have included Dam No. 3 in this bill I had just a little doubt about it myself when I put it in whether it ought to be in there. It is not necessary, of course, to have Dam No. 3 to perform all the functions I have set out in that bill. While personally I would have no objection to the Government building No. 3 in order to clean it up—and it seems to me somebody ought to clean it up—I realize that there is a great feeling in Congress that the Government would be amply protected without building Dam No. 3, and there is no reason why we should build it. Yesterday we had a witness before us, Major Burns, who has given us some very valuable computations on various kinds of estimates on the financial end of these two dams, and he figures out that Dam No. 3, if constructed, would hardly pay for itself. His figures show that No. 2 will make a large profit. It, of course, may be that when the matter is reported out of committee and it gets on the floor of the Senate, they may eliminate No. 3 entirely from the bill. I would not have any serious objection. It would leave the Government entirely protected. If we get the bill at all, we may find ourselves with Dam No. 3 eliminated.

We are very much obliged to you, Mr. Wells. I think we are very fortunate in being able to get you here.

Major Burns, I think I ought to say to you on behalf of the committee that we feel under great obligation to you, and we appreciate your constant attendance and assistance to the committee, and particularly as chairman I want to thank you for your very valuable services in gathering together information as I have called on you for it at various times during the hearings. So far as we can see, we believe that your services have been absolutely unbiased and, personally, I do not agree with your recommendation which has been made. That, I think, demonstrates that there has been no attempt on my part as representing the committee to get anybody to assist us who wanted to advance his own ideas at all, but only to get the facts, and in all your services you have carried out that plan in fine shape. On behalf of the committee I want to thank you very sincerely.

Senator KEYES. I am sure all the committee will agree with you, Mr. Chairman.

Major BURNS. I thank you, Senator, very much. It has been a real pleasure to serve with the committee.

(Whereupon at 11.20 o'clock a. m. the committee adjourned subject to call of the chairman.)
